## GRANULAR

FIRST PROTEIN HYDROLYSATE
WITH A COMPLETE
CHEMICAL ANALYSIS OF EACH
ESSENTIAL AMINO ACID!

Once again, International Vitamin Corporation fills a long-felt requirement of the Medical Profession with a most pleasant-tasting protein hydrolysate preparation. The new "PHV Granular"—a combination of protein hydrolysates, carbohydrate and vitamins in a proper scientific balance—promises to become an essential in the treatment of exhaustion due to over-exertion, in the management of convalescence, in preparation for surgery and as a dietary supplement in cases of malnutrition and anemia (including pregnancy anemia)

# Experience is the Best Teacher

Yes, experience is the best teacher in smoking too!

It was their experience during the wartime shortage of cigarettes which taught people the big differences in cigarette quality. People smoked many different brands then—whatever brand was available. And so many more smokers came to prefer Camels as a result of that experience that now more people are smoking. Camels than ever before. However, no matter how great the demand tree don't tamper with Camel quality. Only choice tobaccos properly aged and blended in the time-honored Camel tray are used in Camels.

Prording to a recent Nationwide survey

## More Doctors smoke Camels

rymids Tobacto Company Winston Salem, N.C.

than any other cigarette

## Until the Foot is "Weaned"

It takes ten years for the general structure of the foot to be completed It takes another decade until the last bone of the foot reaches maturity During all these years, consider how much Pediforme's step by step' lasts can do to nurse the foot along to natural and proper development

Pediforme infant and juvenile shoes are particularly designed to conform to the natural shaping and maturing of the foot

## **R** Pediforme

## Octin - for Relief of Smooth Muscle Spasm

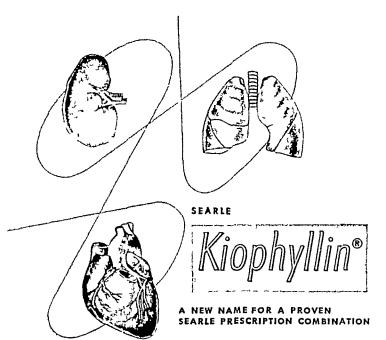

Octin is an antispasmodic, indicated for the treatment of spastic conditions, particularly of the genito-urinary and gastrointestinal tracts

TABLETS - 2 grains Octin mucate
ORAL SOLUTION - 10% aqueous solution (1½ grains per cc.)
AMPULES - 1 cc. (1½ grains Octin hydrochlonde)

Octin (methylisooctenylamine) Trade Mark Hilbuber

BILHUBER-KNOLL CORP, ORANGE, N J

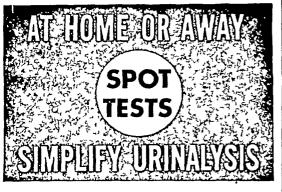

Kiophyllin is the new convenient, easily remembered name now applied to the following widely prescribed combination

Aminephyllin	150 mg	(2½ gr)	
Patessium ledide	125 mg.	(2 gr)	
Phencherhital	15 ma	/14 mm)	

Kiophyllin is indicated in many degenerative and infectious processes involving the heart, the lungs and the vascular system. It is composed of three dependable therapeutic agents in a combination which provides myocardial stimulation, increases urinary output, relaxes bronchlohar smooth muscle, limits fibrous tissue deposition and furnishes mild sedation. It is especially adapted for those conditions requiring prolonged medication.

Available in both plain and enteric coated tablets. The enteric coated form is NEW

G D SEARLE & CO Chicago 80, Illinois

## NO TEST TUBES · NO MEASURING NO BOILING

Diabetics welcome "Spot Tests" (ready to use dry reagents), because of the ease and simplicity in using No test tubes, no boiling, no measuring, just a little powder, a little urine—color reaction occurs at once if sugar or acctone is present.

Galatest

FOR DETECTION OF SUGAR IN THE URINE

## Acetone Test (DENCO)

FOR DETECTION OF ACETONE IN THE URINE

#### SAME SIMPLE TECHNIQUE FOR BOTH

2. A LITTLE URINE

#### **COLOR REACTION IMMEDIATELY**

A carrying case containing one vial of Acetone Test (Denco) and one vial of Galatest is now available. This is very convenient for the medical bag or for the diabetic patient. The case also contains a medicine dropper and a Galatest color chart. This handy kit or refills of Acetone Test (Denco) and Galatest are obtainable at all prescription pharmacies and surgical supply houses

Accepted for advertising in the Journal of the A M A.

## Fundamental Pattern

[17 [17]

157

1473

1110

1173

1457 1531

costd

1419 1458 The efficiency of any method of ovarian simulation is dependent upon the physiologic response and receptivity of the ovaries. A fundamental pattern of successful therapy in secondary amenoriha is the replacement of ovarian hormones by 'priming' the patient with estrogens and progesterone in an effort to improve physiologic function followed by stimulation with equine pituitary gonadotropins. With this fundamental pattern of therapy a normal hormone level may be maintained.

#### Natural CRYSTALLINE ESTROGENS

In Aqueous Suspension\*
(Forbes)

Natural Crystalline Estrogens in Aqueous Sus pension (Forbes) as a source of stimulus emulating the prolonged rhythm of normal ovarian activity permits the administration of a highly potent, purified product. The estrogen molecules held in crystalline form are released and absorbed slowly maintaining a natural level of estrogens in the blood

Preliminary sensitization of the patient with estrogen and progesterone, followed by the use of equine pituitary gonadotropins (GONATROPE Forbes) should produce a natural follicular maturation in hypo-ovarian function

DO
YOU
KNOW
WHAT
THESE
SYMBOLS
STAND
FOR ?

REXALL FOR RELIABILITY

In medieval times, the dragon was the symbol of the chemist and apothecary. Ancient alche mists were said to use dragon's blood in their potions, and the dragon came to mean certain chemical actions. An apothecary advertised, his wares to the world by painting a dragon on a drug pot, and hanging it over his door

Today it is the familiar Rexall sign which assures you of superior and dependable phar macal service. Displayed over more than 10,000 independent drug stores throughout the country, the Rexall symbol on drugs means pure, potent and uniform drugs, laboratory tested under the rigid Rexall system of controls It means unexcelled pharmacal skill in compounding them

## REXALL DRUG COMPANY

## The WHYS of Beech-Nut Flavor

## Because only the finest materials are used

Only the very best fruits vegetables and meats are selected by Beech Nut An extensive agricultural program includes supervision of the growing and harvesting of fruits and vegetables and experimental efforts to produce foods with higher vita min and mineral content

#### Because of careful preparation

All cooking is done in closed cookers in the absence of air Finished foods are quickly packed in glass jars and vacuum sealed. This assures high retention of na turn! flavor and natural food values

## Beech-Nut

Foods for Babies

In many varieties of vegetables, meat combinations, soups desserts and fruits.

## Because uniform quality is assured

A modern test kitchen within the plant and fully equipped and staffed blological and quality control laboratories constantly guard the quality of both raw materials and finished foods

PACKED IN GLASS A most important fact to re member when you recommend baby foods to mothers

they by how it

(Above) Fitting practice session at recent CAMP Instructional Course

## YOUR PATIENTS ARE PROPERLY FITTED When You Recommend CAMP Scientific Supports

CAMP fitters are conscientiously trained to work on the physician's term as technicians in scientific supports. Annual four-day sessions in New York and Chicago (now in their 19th year), a steady schedule of regional classes, individual instruction by the corps of CAMP registered nurses and professionally edited handbooks and other helpful literature have trained thousands of fitters in prescription accuracy and ethical procedure.

palatable easily digested efficient

Protein-Carbohydrate Granules

Protein therapy is important in all branches of medicine. Every cell of every tissue requires protein for growth and repair Protein requirements are therefore frequently enor mous How may protein beadministered in large amounts? The simplest and best way is by mouth, for any patient who can swallow Infusion hazards are avoided more complete nutri tion is provided \* • 'Delcos' Protein Carbohydrate Granules present palatable, concentrated, whole protein of high biologic value, protected from wasteful use as energy . Patients like the taste of Delcos' Granules, and will accept it almost ad libitum Dosage may be pushed to the limit and maintained at a high level indefinitely Moreover, since 'Delicos Granules provide carbohydrate protected, whole protein, containing strepogenin \* a factor lacking in protein hydrolysates and mixed amino acids, maximal nutritional efficiency is achieved Controlled growth tests have shown that 'Delcos' Granules are biologically superior to beefsteak. . 'Delcos Protein Carbohydrate Granules contain casein and lactalbumin, providing a balanced combination of all the essential amino acids, as whole protein, protected from wasteful use as energy by carbo hydrate (30%) Supplied in 1 lb and 5-lb., wide-mouthed jars Sharp & Dohme, Philadelphia 1 Pa

Each serving (2 heaping leaspoonfuls) contains approximately:

VHemin A

Vitamin B: (Thiomine hydrochloride) 2 mg

Vitamin B: (Enbolavia)

Vitamin C (Aucorbic acid)

Vitamin C (Aucorbic acid)

Vitamin D

Menopausal Relief

Plus

A General

Sense of

Well-Being

There is usually a plus in the treatment of the menopause when 'Premarin is employed. The plus is the gratifying sense of well being so many women experience following orally active. Premarin therapy. It is the intendible factor which added to relief of distressing symptoms enables the middle aged woman to resume her normal routine of useful and enjoy able accupations.

To permit flexibility of dosage and enable the physician to adapt oral estrogenic therapy to the particular needs of the patient. Premarin is supplied in three potencies:

Tablets of 2.5 mg Tablets of 1 25 mg Tablets of 0 625 mg bottles of 20 and 100 bottles of 20 100 and 1000 bottles of 100 and 1000

Liquid containing 0 625 mg in each 4 cc. 11 teaspoonfull —bottles of 120 cc

While sodium estrone sulfate is the principal estrogen in "Premaria, other equine estrogens estradiol equilia, equilenia, hippulia are also present as water soluble sulfates. The water solubility of conjugated estrogens (equine) permits rapid absorption from the gastrointestinal tract

(equine)

# Ever wish you were Aladdin?

 $Y_{ou\ remember\ him}$ 

He was the lucky fellow who found a magic lamp. It gave him everything he wished for—from diamond-crusted palaces to a sultan's daughter as his bride

You've probably wished a lot of times for a miracle like this to happen to you Maybe not for out-of-this-world treasures, but for something that will take care of the things that are bound to come up

Like medical expenses, or college for the kids Or maybe just for the nice, safe feeling it gives you to have some extra money put aside for the future

Though no magic is involved, there is a way to give you this security. The Payroll Savings Plan. Or, if you're not eligible for the Payroll Plan but have a checking account, the new Bond-a-Month Plan.

Either way, it's almost unbelievable how quickly your money accumulates

Where else can you get such a *safe*, generous return on your money (\$4 for every \$3)? It's so simple—so easy, you hardly miss the money that you're saving

And don't forget—at the same time, you're making more!

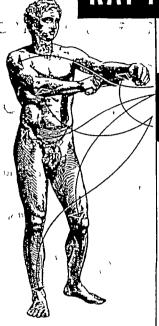

Next to a magic lamp, there's no better way than this to make sure your future is secure.

Save the easy, automatic way ... with U.S. Savings Bonds

#### A Wider Horizon for the General Practitioner

One of the laments most frequently voiced by the public and echood, when it seems judicious to do so, by the medical profession, is What is to become of the general practitioner? Well, what is?

We are all familiar with the complaints about the undue rise of specialists about the lengths to which specialism has been allowed to progress—or, should we say, to which the practice of medicine has been allowed to alump?

If parts of this editorial seem faintly personal we are sorry, but we do not apologize, because personal experience, honestly related, is the only basis for true history from which pertinent conclusions may be drawn

In the first place, what is a hospital? The general practitioner would probably reply that it was an institution he couldn't get his patients into. We think his reply would be fairly correct, and propose to examine the reasons why this is so

Thirty five years ago the hospital was an institution with a big name staffed by the professors in our medical schools, in which internships under professors of the greatest reputation were caparly sought by such

medical students as could afford to take them Many of us could not

For the fortunate ones who could, the hospital offered ample clinical material where the art of caring for the aick was taught by the most experienced teachers Neither the instructors nor the pupils were Both basked in an atmosphere of altrusm that was wonderful-if you could afford it At the end of two years interns would emerge from the hospital with a considerable reputation, they had succeeded not only in getting into the institution but in getting out of it Many of them then coasted into success upon the cont-tails of their preceptors They were known to an awestruck circle of contemporaries, not only as graduates of a certain hospital, but also as "the best surgical assistant Dr Blank had had in years, Thus they frequently were introduced into fashionable practice and were so well rewarded financially that when their predecessors died they were able to step into their shoes. It was an excellent arrangement-for a few And, let us emphasize again for the few who could afford it

In the meantime, what happened to those

who could not? They went into general Their patients were not as a rule anxious to go to hospitals and preferred to be Under such conditions cared for at home the general practitioner did fairly well When a patient became obviously desperately ill, he would be sent to the hospital, there to be operated on by a brilliant classmate who had a hospital appointment Sometimes the brilliant classmate would be so touched by the shabby appearance of his less fortunate brother, who had referred the case to him, that he would share with him a portion of the substantial fee received from the patient Sometimes the less fortunate brother would spread the tale of the charitably-minded surgeon and other general practitioners would refer cases to him in the hope of encountering similar financial justice Thus arose the hemous practice now slightingly referred to as "fee-splitting" We do think it a hemous practice, because it results in patients being referred not to the best, but to the most, shall we say, generous sur-But we think it only fair to point out the genesis of the custom

1480

Then came the advent of the so-called "teaching hospitals," staffed by cloistered graduates who often never had engaged in the private practice of medicine. After their internships they had stayed on and on as residents, and after they had become sufficiently expert were frequently drafted by other institutions to become full-time professors of surgery or medicine. As scientists they are wonderful, but they have small comprehension of, or sympathy with, the problems of the general practitioner

And during this time, the public has become more and more hospital conscious. It wants to go to the hospital for the mildest stomach ache or sore throat. And with the spread of voluntary hospital insurance it can afford to do so.

Naturally the Blue Cross is anxious—for its own sake—that its clients patronize only the hospitals with the best staffs, in which a patient's stay is likely to be as brief as possible

Trustees of voluntary hospitals will tell you, with tears in their eyes, that, as trustees of charitable funds they must assure the spending of those funds for providing the best closed staffs possible. That sounds perfectly reasonable until you examine more closely and find the number of voluntary hospitals that allow themselves to be victimized by admitting compensation cases at rates less than the hospitals pay for the care of charity cases, cases for whose care they were originally founded 1 One would think that worldly-minded trustees would not allow themselves to be so bamboozled either by state compensation boards or by insurance companies Perhaps this is slightly beside the point, but it all goes to show how much farther and farther away the general practitioner is being pushed from the best facilities for, and contact with, the latest developments of scientific medicine

It is always easier to point out the defects of a system than it is to propose a remedy Some of our municipal hospitals are now staffed by members of the faculties of various universities, thus assuring the indigent the same degree of skillful care as that available to the rich who can afford to pay for it. That sounds well on the face of it, until we see that it is more and more narrowing the field to the general practitioner.

Suppose that the general practitioner were allowed to take his patient under voluntary hospital insurance to a municipal hospital Suppose that he were kept in charge of the patient from the beginning of his illness to We think there would be a conthe end siderable resurgence of that spirit which resolves to shoulder personal responsibility and see the patient through We are confident that there are still enough generous practitioners of medicine of the highest reputation who would be willing to help out their less fortunate colleagues in the matter of hospital appointments, with problems that to them seem insoluble

Suppose that under such a system the patient gets well? The father says "I never thought so much of Dr Smith I grew up with him and we live on the same block But when my kid got polio Smith was the only man I could get and he took care of him He took him to the Municipal Hospital He saw him every day He seemed to be doing all right, but Smith wasn't quite satisfied and called in Dr Jones He's the greatest authority on polio in these parts I don't

<sup>&</sup>lt;sup>1</sup> New England J Med 236 491 (March 27) 1947

know whether my kid's going to get completely well, but I do know that he's had the best of care and for money that I could afford to pay, and I've paid it No matter what happens in my family from now on, Smith's the man for me."

Dr Jones says "I never heard of that man Smith before But he called me in con sultation to see a case of polio he had in the hospital and he'd done everything all right. There was only one thing I could suggest and if I hadn't been there I guess he would have thought of it himself I didn't get much of a fee, but I got something, and under the old system I wouldn't have been paid a cent."

Dr Smith says "I got called in on a case of polio the other night—I wasn't sure at first what the trouble was, but the next day I got the kid into the Municipal Hospital—The

third day I called in Dr Jones You know he's got all hell of a reputation, but he wasn't a bit the kind of stuffed shirt I thought he'd

"His fee was only ten dollars, but he said that in the old days he would have had to see the kid anyway and wouldn't have been paid anything. It was all right with him. And he's ill right with me."

And so what have you? Three satisfied people A considerable cementing of the bonds that should be holding the medical profession together. Solidarity instead of disagreement. Sickness paid for without hardship.

It may sound like a dream, but it is one that the inclical profession hospital trus tees municipal governments and the general public would do well to make come true

### Commissioner Edward S Godfrey, Jr, Retires

The retirement of an outstanding, conscientious, efficient public health official ments the attention of the medical profession. The Medical Society of the State of New York has been most fortunate in having for nearly thirty years the advice and assistance of an eminent physician, Dr Edward S Godfrey, Jr, whose service in the New York State Department of Health came officially to an end when he retired May 1

His was a long and distinguished career Since 1936 the State Commissioner of Health, Dr Godfrey demonstrated an unusual ability in epidemiology research, and administration. In this brief acknowledgement of his affiliations with the State Soclety it is impossible to give a detailed account of his positions, activities interest, accomplishments, and honors

His personality, diplomacy and, particularly, his intense interest in doing things for the good of mankind will long be remembered.

He was adviser to the Council Committee of Public Health and Education of the Medical Society of the State of New York. The members of this Committee and its many subcommittees and the officers of the Society owe him a debt of gratitude for his wise counsel concerning a multitude of matters in the broad and ever-expanding field of public health

To 'Ted' Godfrey we express deep appreciation of his interest and assistance, with the hope that many years of activity and happiness await him

## Twenty Thousand Years of Medical Practice in New York State

There are about 400 physicians in the State of New York who have been in practice for fifty or more years. Their combined experience totals 20,000 years of active medical life, and embraces a period of time in

which the most rapid and widespread advances ever experienced took place, not only in medicine but in all the allied sciences, and in many of the arts, excepting the art of living. The mere extension of life itself

from an expectancy of thirty years not long ago to over sixty-five at the present time is not necessarily a cultural gain, nor a satisfaction of the "pursuit of happiness"

Of the 400 fifty-year practitioners of the State, 71 were in attendance at the Annual Meeting at Buffalo on the night of the banquet, May 7, 1947

Rarely is a medical gathering privileged to see in one place a group of men whose aggregate professional experience totals more than 3,550 years, men for the most part hale and hearty, taking life

as it comes, realistically, asking little, giving much. They have devoted more years, these 71 doctors, to the practice of medicine than has constituted the entire Christian era

The editors of the Journal very humbly add then congratulations to these iron men of medicine who have just received their certificates for fifty years of practice from the Medical Society of the State of New York

Their number, 71, constituted about 54 per cent of all the membership who registered at the meeting, 1,316 doctors, excepting guests

# The Journal and Directory Exhibit

At the 1947 Annual Meeting of the Medical Society of the State of New York at Buffalo, for the first time the Journal and Directory featured an exhibit All the editors were present at the meeting and were afforded the opportunity to speak personally to many of the members of the Society for whom they have been producing the Journal and to whom they had directed their editorials and editorial comment

Regrettably, but one copy of the forth-coming *Directory* was available and that one not complete. However, blue souvenir pencils, were thoughtfully provided, with the "Compliments of the New York State Journal of Medicine," so that any member of the Society wishing to express himself on any subject might have the means for doing so. Letters to the editors are always welcome whatever their contents, provided they are signed and are reasonably legible

Miss Willma L Simmons, the technical editor, was in charge of the Journal exhibit, which was to the right of the main entrance of the Memorial Auditorium. One panel of the three constituting the exhibit portrayed the "Journal Through the Years" and consisted of the covers of the Journal at various times in its history. By these covers, the typography, color of paper, and makeup, the changes that occurred in the Journal's appearance, size, and content could be

traced readily Another panel portrayed the Journal as it now is and limited a studious-looking member in the act of reading it Perhaps the editors will be pardoned this suggestive, even immodest advertising venture, the Publication Committee sanctioned it

The third panel showed the *Directory* as it will appear when distributed. It attracted a large amount of attention. One member stood in front of the panel, his hands behind his back, in silence for a long time. Abruptly, he turned on his heel and with an expression of sadness on his features strode rapidly away muttering. "I should hive so long?"

Another member, thin, tall, ascetic in appearance and manner, addressed us abruptly "You write for the Journal?" Modestly we allowed that we did Silence He stared at us a moment, then shook his head and left us without further comment, stowing our souvenir pencil in his waistcoat pocket

The exhibit seemed to be a forward step in bringing the Journal and its editors into closer touch with the membership of the Society. We hope that the souvenir blue pencils given away with the compliments of the Journal will serve as a reminder that your suggestions for the improvement of the Journal are always welcome.

#### CARCINOMA AND HODGKIN'S DISEASE

JOSEPH SKAPIER, M.D., New York City, and Asa B. FRIEDMAN, M.D., Brooklyn, New York (From the Brooklyn Cancer Institute Kings County Hospital Department of Hospitals)

IT IS well over a century since Hodgkin first described the disease of the lymphatic system which now bears his name. A considerable body of factual data has been amassed, but much fun damental knowledge is still lacking, particularly in regard to the cause and treatment of the The question of whether Hodgkin's disease is a truly malignant neoplastic disease or a manifestation of a still unrecognized infection is unsettled A considerable amount of laboratory findings suggest the infectious or virus nature of the process. An understanding of the cause of Hodgkin's disease has been hindered considerably by the failure to isolate a specific agent, by failure up to the present time to transmit the disease to animals, and by the absence of spontaneous occurrence in animals Nevertheless, microscopic features of the lymph node involved by Hodgkin's disease, the presence of typical Reed-Sternberg giant cells, and plasma cells, particularly endothelial proliferations, speak in favor of infection and against neoplasm

The coexistence of carcinoma and Hodgkin s lymphogranuloma in the same patient is very unusual The coexistence of multiple primary cancer is rare enough but certainly more frequent than that of Hodgkin a disease with other neoplastic processes This does not suggest that the presence of Hodgkin's disease is in hibitory to the development of cancer fact that Hodgkin a disease occurs usually in the younger age groups may explain the infrequency of cancer in the Hodgkin's patient. Also the short duration of Hodgkin's disease (average two to three years) explains in part the infrequency of cancer in the Hodgkin's patient Reviewing the literature, one finds few case reports of the coexistence of Hodgkin's disease and carcinoma

Azanrd Reig published a case of coexistence of Hodgkin's disease and carcinoma of the colon in a postmortem examination of a 58-year-old man.

Lloyd F Craver reported a case of a 28-year old woman who had careinoma of the breast and Hodgkin's disease of the ipsolateral axillary lymph node both proved by biopsies <sup>2</sup> The same author published another case of the coexistence of Hodgkin's disease in the right submaxillary region and adenocarcinoma of the colon in postmortem examination of a 53-year-old woman who died from perforation of the large bowel.

Rudolio Sammartino reports a case of a 62 year-old man who had a retroperitoneal Hodg

kin's tumor and metastatic squamous cell care; nome, the primary tumor of which was not found.

In the past few months the authors have observed 2 cases of Hodgkin's disease associated with mammary cancer

#### Case Reports

Case 1 -II II a 68-year-old white woman was first seen at the Brooklyn Cancer Institute of Kings County Hospital New York in May of 1945 com planning of painless multiple masses of five months duration in her axillary and supraclavicular regions. The physical examination revealed a poorly nour ished woman with multiple soft lymph node masses in both axillary, supraclavicular and inguinal regions The liver and spleen were not felt breasts were entirely normal. The x ray examina tion revealed no evidence of pulmonary, pleural cardiac or bone pathology Blood morphology count 3 260 000 white blood count 30,200, poly morphonuclears 84 per cent lymphocytes, 13 per cent, cosmophils, I per cent, monocytes, 2 per cent. The patient had been treated for diabetes mellitus with insulin for the last twelve years, her blood sugar was 225 mg per cent and urine showed 4-plus sugar The microscopic examination by biopey of a left axillary lymph node revealed loss of the follicular architecture and infiltration of the node with small round lymphocytes plasma cells, cosmophils and reticuloendothelial cells There were also noted occasional multinucleated Reed-Stern berg cells The capsule showed marked thickening and invasion by small round cells. The diagnosis was Hodgkin's lymphogranuloma (Figs. 1 and 2)

From June 14 to July 20 1015, the patient was treated with x ray therapy to her supraclavicular and axillary regions and showed temporary improvement

In October of 1945 during a periodical physical examination of this patient in the outputient department of the Brooklyn Cancer Institute a hard not freely movable, orange-sized mass was felt in her right breast. Needle biopsy was per formed and the microscopic examination revealed neets of cells which appeared to be inalignant in nature. These cells, polygonal in shape showed marked hyperchromatic nuclei. The diagnosis was carcinoma of the breast (Fig. 3)

The patient refused surgery and was put on the antireticular cytotocic serum therapy (A.C.S.) from October 1945 until March 1946. She showed some general improvement such as gain in weight, improvement in blood picture and rehef from pain While her general condition improved temporarily the mammary carcinoma extended progressively infiltrating her entire right breast, without showing evidence of any metastatic lesions.

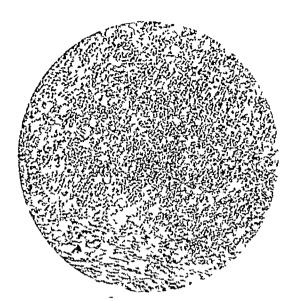

Fig 1 Microphoto (magnified 90×) of lymphnode biopsy, showing loss of follicular architecture, thickening of the capsule, and reticulo-endothelial proliferation

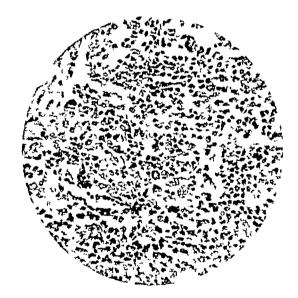

Fig 2 Microphoto (magnified 400×) showing the reticulo-endothelial proliferation, Reed-Sternberg giant cells, and plasma cells

In April of 1946, the patient became stuperous, she had convulsions continuously for forty-eight hours before death No autopsy permission was obtained

This diabetic patient had two conditions cinoma of the breast and Hodgkin's disease

Case 2 — The patient, a 40-year-old white woman, consulted J S in January of 1945, because of swelling of the right cervical area At the time of the exami-

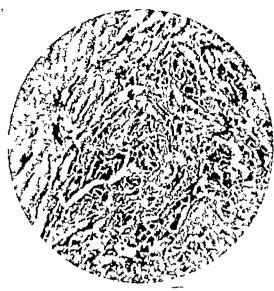

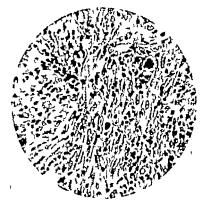

Fig 3 Microphoto (magnified 400×) showing needle biopsy of the breast. Note nest of cancerous cells

nation she had a nodule the size of a walnut in the right cervical posterior triangle and a pyrenia of 101. The breasts were entirely normal. The red blood count showed a hemoglobin of 90 per cent, red blood count, 4,250,000, white blood count, 9,000, poly morphonuclears, 72 per cent, lymphocytes, 12 per cent, eosmophils, 10 per cent, monocytes, 6 per cent. No abnormal forms of cells were found. The heterophilic agglutination test for infectious mononucleosis was negative.

The cervical mass was excised and was reported as follows—complete loss of architecture, diffuse overgrowth of small lymphocytes, marked reticulo-endothelial proliferation with tendency to fibrosis Numerous plasma cells, rare cosmophils, and polymorphonuclear cells—Many epithelioid and Reed Sternberg cells were found—Mitotic figures were not uncommon—The diagnosis was Hodgkin's lymphogranuloma (Fig. 4)

The patient remained quiescent for the ensuing year, during which interval she received small amounts of x-ray therapy to the right cervical region Repeated x-ray of her chest and blood counts showed no abnormalities In March of 1946, an enlargement and some induration of the lower outer portion of the right breast was noted right breast being about 30 per cent larger than the left, the physical examination revealed a single, very hard nodule, with restricted mobility, surrounded by engorged soft mammary tissue It was first thought that the condition was due to lymph stasis from blockage of the lymphatic drainage of the axillary There was no other evidence of disease, no lymphadenopathy, and x-ray films of the lungs and mediastinum once more were negative Blood count was normal As the frozen section of the breast tissue showed carcinoma, a radical mas-

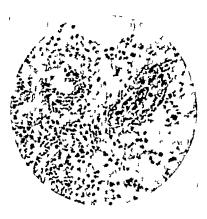

Fig 5 High power photomlerograph taken from the breast tissue to illustrate the duet cell carcinoma.

tectomy was performed. The microscopic study of the specimen showed long segments of ducts lined by carcinomatous cells No involvement of the axillary nodes by carcinoma was found (Fig. 5)

This patient also had two conditions a carcinoma of the breast and Hodgkin a disease of the lymph nodes.

#### Comment

The association of carcinoma with Hodgkin s disease is believed to be very rare. The rarity of the coexistence of these two diseases may be explained by the age of meidence by the duration and by the nature of Hodgkin's disease

We have no evidence to believe that Hodg kin's disease has an anticarcinogenetic effect in Nevertheless the fact humans or vice versa that the coexistence of these two diseases is so unusual is very striking and further clinical observations of these facts would be of great value to investigators of the Hodgkin s problem

#### THE GOOD HOSPITAL

What makes a hospital good? It surely is not its display of worldly goods—its terraced stores of brick and limestone and mortar agleam with the brilliance of shining metal. It is not its bed capacity nor the longevity of its clinic patients. It is not the efficiency of its credit office nor the speed of its ambu lance service. It is not the number of births recorded or deaths certified to by the pathologist or the square yards of film exposed to the x ray — It is not the size of its endowments (although many a hospital could well utilize increased endowed funds while hospital costs are rising so rapidly) nor is it the aire of the internand resident staff and the complex 'teaching' schedule arranged for them.

The members of a good hospital staff are composed

of good doctors and, as good doctors, practice good

The member of a good hospital staff commits him self to the type of medical practice which will not bring discredit upon his fellow members. He practices his art with purity and with holiness—in the wording of the Hippocratic Oath. He eschews the shady and the gaudy the slipshod and the irrelevant knowing that these aberrations accomplish nothing for the betterment of his patient the in crease of his professional stature or the professional repute of the hospital staff of which he is a member

The good hospital is staffed with men of this spirit. -WILLIAM BROWNE

-Detroit Medical News April 14, 1947

# THE NEGLECTED PROSTATE GLAND

FREDERICK COONLEY, M D, St George, Staten Island, New York

ITH the great advance that has been made in preventative medicine during the past fifty years such diseases as typhoid, smallpox, and diphtheria are seldom seen by the present-day physicians, and tuberculosis is steadily being During the past one hundred years eliminated the average length of life has been doubled Statistics of the Metropolitan Life Insurance Company for 1944 give the average length of life as sixty-five years, women were hving longer-68 95 years, and men, 63 55 years If the present rates continue, by 1960 the average lifetime will be close to seventy years This situation is focusing the attention of medicine on genatrics, which is the care of the aged, and on geratology which is preventative genatrics

The prostate gland plays a very prominent part in the causation of the handicaps which men suffer in the later decades of life. Urologists estimate that 35 per cent of men over 50 years of age suffer from hypertrophy or, more specifically, hyperplasia of this organ. Of this number 10 per cent die of cancer. At present the prospect of a cure of this condition is most discouraging. An early radical removal is the only hope, hence the need of an early diagnosis.

Hyperplasia of this gland is not a disease per Due to its location an enlargement produces interference to the outflow of urine which, in turn, produces a chain of pathologic conditions that make old age a misery and frequently causes death unless relieved Applications of the principles of preventative medicine can greatly ameliorate this situation The medical profession should become prostate conscious as it has in focal infections, cancer, and tuberculosis Among the larty there seems to be abysmal ignorance as to the early signs and symptoms of urmary obstruc-Many seem to think it only the inevitable symptom of old age The urologists estimate that 25 per cent of men suffering from this condition do not seek advice until complete obstruction Among medical men there seems to be a very prevalent aversion to making a rectal examination with the gloved finger, as evidenced by the history of cases suffering from cancer of the rectum, internal, and even external hemorrhoids They frequently report several consultations with only a visual inspection of the anal region If, in the treatment of every man patient over 45 years of age no matter what the complaint was, a brief urinary history were obtained and an examination of the prostate made, the patient could be alerted as to the danger signals and seek early treatment

There is nothing new or original in this paper It is based upon the treatment of only 74 cases. one of which came to operation after sudden obstruction and this might have been obviated except for impatience in awaiting restoration of Two were cases of cancer normal function is impossible to reach reliable conclusions on such a small series of cases but a more widespread application would prove quickly whether the author's conclusions are too optimistic object of this article is to focus attention on a condition that is prevalent and will continue to become more so, and to outline a course of treatment that can be given by general practitioners in the office and with such laboratory aids as are daily employed in the diagnosis and treatments of other problems This paper is too brief to discuss the cause and morphology There seems to be some hope that this problem eventually will be solved on a hormone basis. It is sufficient to know that there is a hyperplasia of the glands and muscles producing periurethral pressure, intrusion of the enlarged gland into the urethra or into the bladder, which causes a slowing of the stream in force and volume, and difficulty in starting and shutting off flow, together with fre-There is, also, frequently lower abdominal and pelvic distress

#### Treatment

We are considering only simple hyperplasia It is necessary, however, to eliminate infection, stone, and cancer if possible before beginning treatment A complete history and thorough physical examination is as essential here as in any medical problems Advanced cardiovascular changes are frequent in these cases and must be carefully evaluated The first step, after history and a general physical examination, is a rectal examination noting the condition of the rectum The best position for this is the evaggerated knee chest position on the table or the standing elbow to knee It is fairly easy to acquaint one's self with the feel of a normal prostate When one recalls that the prostate is a seven-lobed organ and that one or all of the lobes except the posterior may be involved it is possible to realize the varied picture that may present itself. The posterior lobe is the one where cancer usually begins, but it does not become hyperplastic Note the size rounded or smooth, irregular or nodular, and the consistency—adherent or moveable If it is stoney, hard, or adherent, suspect cancer A punch biopsy and x-ray of the pelvis should be If the biopsy is positive the diagnosis is

settled, but one negative report cannot be relied upon. The x my will reveal metastases or atone if present Frequent checkup in these cases should be made

The patient should void in two glasses and a catheter passed to determine where there is a stricture, and the presence or absences of residual urne. If present it should be measured Should this persist during treatment an intravenous urogram will disclose diverticuli or hydrone-phro-us A phthalein or indigocarmine test will determine urnary function and a cystoscopic examination will reveal a median bar if present. This should be done by a urologist Urine analysis will disclose the presence of infection If present it must be determined whether the posterior urethm, the seminal vencles, prostate or kidney is involved

The milking of the prostate and seminal vesicles is frequently unsatisfactory. In the elbow-knee position with left hand on the patient shoulder, it is impossible to reach the seminal vesicles unless body pressure is made on the right elbow to relax the perineum with the three fingers. If the vesicles are reached frequently nothing appears at the meatus after milking the urethm. If there was any secretion it has regurgitated into the bladder. A smear of the centrifuged specimen of the voided urine will reveal infection if present. When infection does not clear up promptly the case should be referred. If a stricture is present it should be dilated gently by graduated sounds and checked for permanent relief.

It is well to remember that in passing a catheter or massaging these cases for the first time there is danger of creating an acute condition that might require hospitalization and the patient should be so informed. If there is persistent rotention of over 4 ounces an intravenous urogam blood chemistry, and cystoecopic examination should be made. If, after treatment, the residual remains around 4 ounces it is not a demand for surgery but it does demand frequent checkups and, in my opinion, the case should be referred.

The size of the gland bears no direct relationship to the obstruction A large gland may produce no obstruction while on the other hand a medium or small gland may produce a median bar with obstruction and retention Testoster one propionate, 25 mg may be given intramuscularly every two or three days until improvement and then reduced to once weekly This is rather expensive and if it is a faminual hardship stillbestrol may be given instead

The tolerance should be tested by beginning with 1 mg twice daily and increasing rapidly to 5 mg three times a day if tolerated — If improve-

ment occurs this may be reduced gradually to 5 ing once a day, to be continued two or three months with a rest week each month Occasion ally, the breasts become enlarged and painful These symptoms disappear on reduction of dos-Heat to the prostate can easily be applied by the patient himself with the use of the Eisner instrument. This is a hollow spoon-shaped device with an inlet and outlet nipple. It can be inserted easily into the rectum just beneath the With a large vessel at bed level filled with water between 115 to 120 F (the tempera ture of which can be maintained with a bath thermometer) and an empty one beside the bed the water is suphoned slowly From five to ten gallons should be used. At the end, a few gallons of water at room temperature is run through This produces a very beneficial hot and cold reac tion and may be given once or twice daily

Diathermy has been reported favorably by some observers but I have had no experience with its use. The use of deep a ray therapy by a competent roentgenologist has been enthusiastically recommended by some urologists few of my cases, who were nervous about irmga tions and massage, it has proved successful Massage has proved very helpful Just because the gland is so readily accessible is not an invita tion to assault and battery Any textbook will give minute details. It should be done gently the rectal mucosa should not be stroked, but a gentle pressure and a rolling motion of the terminal phalanx of the finger should be applied systematically to the whole surface of the gland If painful, a sedative suppository should be inserted one-half hour before treatment twenty treatments semiweekly should be suffi cient.

Sits baths properly given by the patient himself are also helpful. They can be given daily with the irrigations or on alternate days. A folded bath towel in the tub to sit upon adds to comfort. The water, as hot as can be withstood, sliculd not be over the crest of the ileum. Sitting down with knees drawn up, hot water is added as cooling takes place. Twenty to thirty minutes suffices.

A careful check on diet should be made, all excesses discouraged, and proper elimination advised together with moderate exercises. There is considerable divergence of opinion as to the reduction in size of the prostate dehieved by the use of testosterone, massage heat, and irrigation. In some cases there eeems to be slight reduction only, depending upon the amount of congestion previously present. However with the improvement in clinical symptoms, the question of estimated reduction is merely academic. One case report will concretely outline the treatment.

### Case Report

On July 27, 1945, C H, a man 64 years old was operated upon by the author under local anesthetic for a double inguinal herma. The right side was complete, direct, the left side indirect, incomplete On July 29 he suffered a large intestinal hemorrhage resulting in severe shock On July 30 catheterization became necessary There was hiccoughing for three days Stilbestrol, I mg three times a day, After a urologic consultation a bladder nas given splint was applied and the dose of stilbestrol increased to 5 mg three times daily The prostate was symmetrically enlarged and boggy Surgical removal as soon as the condition improved sufficiently was advised The patient refused to accept this decision Sutures were removed on the seventh day after primary healing The bladder splint was removed after eight days and the patient was allowed Use of sounds was begun to dilate an anterior urethral stricture. Daily sitz baths were given and Eisner tube irrigations begun blood chemistry was normal

A mild cystitis developed After catheterization 20,000 units of penicillin were instilled in the bladder The infection cleared up in a week The patient was now taking 5 mg of stilbestrol three times a day and strychnine sulfate, 1/20 of a grain three times On August 21 a barium cnema followed by a gastrointestinal series and proctoscopic examination failed to reveal the source of hemorrhage. The residual urine at the time was 600 cc. The improvement was rapid after starting irrigation. The residual urine steadily decreased The size, force of stream, and ability to void improved On the day of discharge, September 10, the residual urine was 50 cc This man was given prostatic massage semiweekly at my office for three months He continued the sitz baths and prostatic irrigations during this time on alternating days Sounds were passed once monthly. The prostatic irrigations were discontinued after a month but a sitz bath was taken daily Stilbestrol was reduced to 5 mg twice a day, every three weeks, then rest for two weeks, then 5 mg There was no residual urine A checkup in July, 1946, showed no residual urine, the stricture was still patent, there was occasional nocturia, once or twice depending on the amount of fluids ingested, and urmation was normal. The prostate was very definitely reduced in size The patient is doing his regular work and feeling physically fit All medication and treatment has been discontinued

This was apparently a case of acute congestion superimposed upon a hyperplastic condition retention developed a review of the history revealed that he had had symptoms of an enlarged gland for There was increased frequency and inability to void in the morning before taking a bath or This difficulty was not present in the This history should have been elicited at the time of admission

### Summary

An attempt has been made to outline a treatment that has relieved and checked hyperplasia of the prostate in a small series of cases - It can be applied by all general practitioners. It is urged that every man patient over 45 years of age, irrespective of his complaint, be questioned as to his urmary habits and a rectal examination made The patient then can be alerted to the early symptoms of obstruction If in all hospitals it should become routine to record the urmary history of men patients over 45 and in the physical examination to state the condition of the prostate gland, a surprising number of hyperplastic prostates would be discovered and much suffering and serious illness prevented by early treatment

### TB DEATH RATE AT NEW LOW IN STATE

Record low death rates from tuberculosis were recorded during 1946 for New York State as a whole, for New York City, and for the State, exclusive of New York City

According to provisional data reported by the State Department of Health for 1946, there were 1,900 resident deaths from all forms of tuberculosis— 132 fewer than in 1945—in the State outside of New York City, or a new low rate of 30 2 per 100,000 population, as compared with rates of 32 7 in 1945 and 32 5 in 1944 The previous low rate was 31 9 in

1941, when there were 1936 deaths reported There were 5,551 cases of tuberculosis reported in the upstate area in 1946 as compared with 4,768 in 1945

In New York City during 1946 there were 3,655 resident tuberculosis deaths as compared with 3,875 in 1945 The new low rate was 47 0 as compared with 50 1 in 1945 There were 7,313 reported cases in 1946 and 7,203 in 1945, in New York City

The provisional tuberculosis death rate for the entire State was 39 5 in 1946—a new record—SCAA News, April, 1947

#### MANAGEMENT OF INFERTILITY ASSOCIATED WITH OLIGOSPERMIA

JACOR CLAHR M.D. M. L. HAMMERSCHLAG, M.D., and IRVING SMILEY, M.D. F.A.C.S. New York City

(From the Department of Gynecology Bronx Hospital)

IIL treatment of obgospermia to elevate the L sperm density has produced fairly poor re-Hotchkiss 1 summarizing the results of authors on the value of hormonal therapy for defective spermatogenesis states "there is no effective treatment for advanced degeneration of spermatic tissue and that improvement can be expected in only a few unpredictable cases" Oligospermia per se is commonly regarded as an important cause of infertility thus focusing attention on treatment of the man in such cases However, that oligospermia may be present in fertile matings was brought out by Hotchkiss? when he investigated the sperm counts of two hundred men whose wives were pregnant and attending the prenatal clinic. He found that 25 per cent of the men had oligospermia

During routine studies of sterile couples it was noted that a number of conceptions occurred despite oligosperinin. These pregnances usually followed uterine manipulation particularly tubal insufflation. In addition there were several cases of secondary sterility with marked oligosperinia in couples who gave a history of provious pregnancies following tubal insufflation. In view of the above, and the poor results of the treatment of oligosperinia by others and ourselves it was decided to attempt to assess the comparative value of treatment of the min alone, the woman alone and both the woman and the man simultaneously.

There were 48 cases of infertility associated with objospermia selected from the Storility Clinic of the Bronx Hospital and our private practices. These cases were divided into three groups according to the following plans for therapy namely treatment of the husband alone (Group A) treatment of the wife alone (Group B), and treatment of the wife and husband (Group C) (Table I) Only couples who had complete studies and who received therapy were included. None of the patients who had investigation but no therapy were selected even though

| TABLE 1 | TABLE 1 | Treatment | Number of Cases | Number of Cases | Number of Cases | Pregnancies | Pregnancies

pregnancies ensued in several instances. None of the men except one with a basal metabolic rate of minus 15 revealed any discernible abnormality other than oligospermia. A man was considered oligospermic only when his semen count on two occasions following three or more days of sexual continence was found to be below 60,000 000 per

#### Treatment

Group A-IIushand Alone -There were eleven couples in this group. All the women were nor mal as far as could be ascertained. The only abnormality found was obgospermia in the man The sperm counts varied from below 5 nullion to below 50 million per cc. as noted in Table 2 Of these counts, seven were below 5 million one below 20 million two below 30 million, and one below 50 million In 10 cases therapy consisted of the administration of gonadotrophic substances. using 500 to 750 rat units two to three times a week for periods of from one to seven months not counting rest periods Rest periods were used during the course of therapy for the administra tion of pregnant mare serum to prevent the for mation of antihormones The gonadotropus used were equine chorionic human chorionic, or an terior pituitary hormone, either separately or in combination Thyroid was used in three cases one of which had a basal metabolic rate of minus One full-term pregnancy occurred following therapy indicating  $9^{1}/_{11}$  per cent success

Group B—Wyfe Alone—In this group of 25 cases there were 11 pregnances or 44 per cent success (Table 1) The sperm counts varied from between below 5 million to below 60 million per ce as noted in Table 2 Pregnances occurred in four couples where the sperm counts were very low two below 5 million and two between 10 and 20 million In addition to the object-permia of the

20-30 30-40 40-50 50-60	•	***	

Pregnancy did not follow therapy

Pregnancy did follow therapy

men there were sixteen women who had some type of demonstrable abnormality. These abnormalities were pelvic infection (2 cases), tubal stenosis (2 cases), complete tubal occlusion (5 cases), marked cervical erosion necessitating congulation (3 cases), hypoplasia of the uterus (1 case), oligomenorrhea (2 cases), and obesity (1 case). One woman had three abnormalities and another two

There were nine other couples in this group in whom no demonstrable abnormality was found in the woman. Therapy was directed at increasing the fertility of the woman and resulted in one full-term baby. Attempts at increasing the fertility in those women in whom no abnormality was demonstrable consisted of administration of estrogens, 10,000 IU, or its equivalent every three days for 3 to 4 doses, the last injection to be given before ovulation, thyroid to tolerance even though the metabolism was normal, cervical dilatation alternating monthly with tubal insufflation.

The correction of the abnormalities in the woman was carried out as follows pelvic diathermy, repeated tubal insufflation, cervical coagulation, administration of estrogens, thyroid, cervical dilatation, weight reduction, and x-ray therapy to the pituitary gland and ovaries

Group C-Wife and Husband -Treatment of the wife and husband was carried out in twelve couples with full-term pregnancies resulting four times, or an incidence of  $33^{1}/_{3}$  per cent (Table 1) The sperm count varied from below 5 million to 40 to 50 million per cc One pregnancy occurred with the count below 5 million, two with the count 5 to 10 million and one with the count 10 to 20 million Of the twelve couples, five women had at least one demonstrable abnormality these five, one full-term pregnancy resulted abnormalities were tubal stenosis (1 case), closed tubes (2 cases, 1 with hypothyroidism), and oligomenorrhea (2 cases, 1 with hypothyroidism) Treatment consisted of correcting the abnormality of the woman in addition to organotherapy of the man (Treatment of the man and woman are given above in Groups A and B)

There were seven other couples in this group in whom no demonstrable abnormality was found in the woman, with three full-term pregnancies resulting. In addition to organotherapy for the men, the women received therapy to increase their fertility.

#### Discussion

Although this study includes only forty-eight couples, it is suggestive that the greatest percentage of pregnancies is obtained when therapy is directed toward the woman. The single preg-

nancy obtained in Group A, in which the man alone was treated, suggests the difficulty in increasing the fertility of the man. In addition, the sperm count of the men after therapy, including all the successful pregnancies in Groups A, B, and C, did not increase sufficiently to convince us that the therapy used was effective in raising the semen count

Because the results following organotherapy of the man were so poor, an attempt was made to treat the woman alone with the idea that perhaps the fertility of this member might be increased sufficiently to overcome the lowered fertility of the man A theoretic way of conveying this notion is as follows. If one assumes that the figure for average fertility for the man and woman is 50 each, then pregnancy will occur if the combine l fertility figure is 100. When a min has a low count, and his fertility figure is 30 and his wife has a minimum normal fertility figure of 50, then a pregnancy will not result because the combined fertility figure is less than 100 Since it is our contention that the figure for the man cannot be raised very readily, perhaps that of the woman can be raised sufficiently above the minimal normal of 50 in order to attain the desired 100 in combination with that of the man

In the group in which attention was given to the woman alone, ten of eleven pregnancies occured in women who had some abnormality which was a factor in the cause of the infeitility Because all the pregnancies except one occurred in the women who had some abnormality which was corrected, we are of the opinion their fertility figures were raised above 50, therefore resulting in combined fertility figures of 100 or more when The other extheir husbands were included planation may be that their husbands were of normal fertility despite the oligospermia, and raising the fertility figure of the women to normal resulted in conception. In other words, these husbands are comparable to the group of men with oligospermia found in 25 per cent of the Hotchkiss group whose wives were pregnant and attending the prenatal clinic

Although the results of organotherapy in the man alone were poor, we believed that combined with therapy of the woman the outcome might be better The percentage of pregnancies was defimtely greater, but did not show any increase over the group in which therapy was given to the wife The semen count repeated in two of the successful cases after impregnation did not reveal any marked changes in density One of these men had received organotherapy for one year before he came under our care, without any pregnancy ensuing His wife became pregnant one month after the onset of therapy directed at increasing her fertility

There were four impregnations in couples in whom no abnormalities were revealed in the woman to account for the infertility Therapy in each case was directed at increasing the fertility of the woman In one case the man received orcanotherapy in addition. The routine used was

- Latrogens in small doses before ovulation-.2 mg of di-ovocylin [Ciba] every three days for 3 to 4 doses.
- Thyroid to tolerance.
- Corvical dilatation alternating monthly with tubal insufflation

Since conceptions have occurred even in several cases in which the counts were very low, artificial insemination with a heterologous donor is not ad vised immediately. If the woman has an abnormality correction of this abnormality may be the only therapy needed. On the other hand, if the woman does not show any causes to account for the infertile marriage therapy should be directed at increasing her fertility However, if this fails after an eight to twelve months' trial then the

problem of artificial insemination with a heterologous donor should be taken up with the couple In our series, there were two couples who agreed to artificial insemination after failure of a trial of treatment. In both cases artificial insemination resulted in pregnancies These two pregnancies are not included in our percentage of pregnancies following treatment.

#### Conclusions

The results of organotherapy in the treatment of olicomermia to date are very poor or completely ineffectual

Therapy should always be directed at in creasing the fertility of the woman unless there is a correctable cause for the olicospermia

The prognosis is best whenever a correct able abnormality is found in the woman

#### REPORT TREND TOWARD RURAL PRACTICE BY RETURNED DOCTORS

The Bureau of Information of the American Medical Association, which provides the medical officer with information regarding areas needing physicians 'is sensing the trend of returned medical officers to move away from their recent venture in city practice to accept the opportunities of more active practice in smaller communities, according

to Virginia Shuler, director
Writing in the Journal of the American Medical
Association (May 17) the author points out
"Demobilization is not completely over Many
young physicians are still in the armed forces, and
a large proportion of the resident physicians doing
postgraduate work in hospitals are men who served in World War II According to the Directory Department of the American Medical Association approximately five thousand physicians have not

yet decided on a permanent location Already the Bureau of Information is sensing the trend of returned medical officers to move away from their recent venture in city practice to accept the opportunities of more active practice in smaller

communities

From studies of physician distribution the general picture for location of physicians during the year following \ J day shows an adequate supply of physicians in most of the states but reflects

a need for a more coordinated system of medical service in many of the rural areas. "Leaders of the medical profession interested in better rural medical service are working with the farm organizations to outline a program of activity to develop in rural areas an appreciation of modern medical service and the responsibility of the com-munity in planning a health program that will make the country physician a working partner toward decentralization of medical care from urban or large trade centers to the more rural sections of the population. The medical profession and the farm groups want to make rural medical service more adequate not only to the farmer but also to those who extend this service to the farmer

To F 8 Crockett, Chairman of the Committee on Rural Medical Service of the American Medical Association has recently announced that the Farm Bureau, the Farmers Union the Cooperative Milk Producers Federation and the Grange have each appointed two of their members to act in an advisory capacity to the Committee on Rural Medical Service of the American Medical Association committee will hold a meeting soon to outline and develop an active program for regional and local rural representatives. Thomas A. Hendricks Secretary of the Council on Medical Service, is working out a plan with the Committee on Rural Medical Service to coordinate the council s and the

committees regional meetings in order to develop through workshop conferences the most adequate extension of medical service to all areas In December 1946, the Bureau of Information began a survey through the local medical societies to determine the conditions and distribution of medical care in the rural areas of the country Through the cooperation of the secretaries of the state and county medical societies listings of areas which have requested physicians are available to help the doctor in selecting an area in which to

establish his medical practice.

Accompanying the Journal article are reproductions of several state maps showing the trend in locations of physicians from April 1946 to Janu ary 1947—the peak period of demobilization of dectors from the armed services. The article also carries comments by several state medical secretaries of conditions and distribution of physicians as related to medical care in their counties.

# TRIDIONE THERAPY IN INSTITUTIONALIZED EPILEPTIC PATIENTS

EUGENE DAVIDOFF, M D, Sonyea, New York

(From the Craig Colony for Epileptics)

TRIDIONE (3-5-5 trimethyl oxazolidine 2-4 dione) recently has been recommended as a useful pharmacotherapeutic agent in the control of epileptic manifestations Richards and Perlstein1 reported its efficacy in patients suffering from petit mal seizures and in cerebral palsies of They claimed that triextra pyramidal origin dione had less effect on the spastic forms of cerebral palsy

In a group of 40 patients with petit mal seizures, Lennov<sup>2</sup> reported that 11, or 28 per cent, were free of seizures and that 21, or 52 per cent, experienced at least a 75 per cent reduction in the number of seizures Ten patients, or 20 per cent, were helped only moderately He also observed that in a group of 10 patients who experienced frequent grand mal seizures, the results were disappointing According to Lennov, tridione is not DeJong<sup>3</sup> stated that patients with psychomotor manifestations were beneficially af-According to Thorne, 4 3 of 11 deteriorated epileptic patients with grand mal seizures were better during treatment with tridione than with other medication In 6, the seizures were equally well controlled by tridione Two were made worse

The purpose of this paper is to report the results obtained following the administration of tridione in 42 epileptic patients at Craig Colony Five of the 15 patients suffering from cerebral palsy had had no seizures during the previous year Thirty-two of the patients had received the drug for more than two months In 10, administration of the drug was discontinued before eight weeks had elapsed because of the toxic effects encountered

#### Method of Procedure

The patients were grouped as follows

	. 1,	- the Ware O- author up totto !! ?	
A	Orgai	nic or Symptomatic	
	Čer	ebral palsies	15
	(a)	Extrapyramidal type	
		(No seizures noted for one year)	5
	(b)	Cerebral spastic groups	10
В.	Funct	cional or Idiopathic	
	1	Petit mal stupors	7
	<b>2</b>	Psychomotor predominant sei-	
		zures	10
	3	Grand mal convulsions	7
	4	Myoclonias	3

None of the spastic cases chosen had Jacksonian seizures The convulsions were of the mild grand mal type in 6 of the spastic cases Twelve of these 15 palsy cases were children under 15 years of age

We have observed that many of our patients frequently manifest both grand mal convulsions and petit mal stupors during the course of their illness 6 However, the 7 cases of petit mal reported in this study were relative uncomplicated, and grand mal phases had not been observed in these patients during their residence in the institution or were at a minimum for one year prior to the administration of tridione

In our experience psychomotor seizures are frequently associated with or follow grand mal convulsions 5 However, in the 10 cases in this series, these so-called equivalent (psychomotor) phases were the predominant feature

After a careful preliminary physical examination, the patients were placed on 3 Gm of tridione three times daily After four weeks, if no untoward results occurred, the drug was given four times daily The next month the drug, if well tolerated, was administered five times daily The majority (30) of the patients received 0.3 Gm three times daily during the major part of the period of observation Apparently 0.9 Gm (15 grains) daily is the optimum dose 2 However, the dosage was diminished to 0 3 Gm to 0 6 Gm daily when untoward effects appeared and later gradually increased if necessary Records of blood pressure, pulse, and respirations were kept In many instances electroencephalograms were done and these findings will be reported in a subsequent communication Blood counts and urine examinations were done weekly. The eyes, particularly the eyegiounds, were checked prior to and following administration The patients were watched carefully for untoward or toxic effects Previous medication was not discontinued until it was felt absolutely safe to do so and then only gradually

#### Results

The results obtained in the various types may be classified as follows

## A Symptomatic Group

Cerebral Palsies -The best results were obtained in patients suffering from cerebral palsies Eleven of 15, or 73 per cent, of the cases in this group responded favorably Ten of the cases were improved markedly

Four of the five extrapyramidal types (dystonic

or athefold) and seven of the ten spastic types manifested improvement in their ability to coordinete and in their mental attitude. Only one of these 11 improved cases had a seizure during the administration of tridione However, the five extrapyramidal types had had no seizures for at least a year prior to the administration of tridi one

The musculature of the 7 improved spastic eases was more relaxed, and their guit improved They responded better to balancing tests and did not fall as frequently Two of the 4 unimproved cases were worse. In I spastic case the grand mal seigures were tripled. One of the athetoid cases developed a severe toxic reaction accompanied by dermatitis exfoliativa

Tridione was apparently of the most value in those cases of cerebral palsy in which convulsions either were absent, not severely manifested, or at a minimum Ten of the 11 patients who im proved were children under 15 years of age. Two children were unimproved. The results in the three adults were not as favorable children who manifested convulsions of more recent onset seemed to respond best

#### B. Idiopathic Group

Petit Mal Stupors -- Four of 7 patients with idiopathic petit mal stupors were improved Case 1 has had no seizures for more than six weeks, although during the first two weeks the number of petit mal stupors increased alarmingly Case 2 and Case 3 also experienced a temporary increase in petit mal abstractions prior to the marked diminution noted in the second month In these 3 cases, while the results were discourag ing during the first month, dramatic improvement was noted during the second month woman patients, cases 5, 6 and 7, who had never had a grand mal convulsion during their resi dence in the institution, manifested grand mal seizures. Case 7 developed status epilepticus following fifteen grand mal sergures and was critically ill for four days. Following the administration of intravenous barbiturates she recovered This was the only severe toxic reaction noted in the petit mal group

Psychomotor Predominant Types -The mental status of 5 of 10 patients who evidenced a predom mance of idiopathic psychomotor seizures was definitely improved. One had no episode in two months during the administration of tridione Another experienced only one period of excitement In the other 3 patients all of whom experienced only two psychomotor attacks during the period of therapy these episodes were consider ably milder A patient who has shown a tem porary period of improvement at the end of two

months experienced a severe prolonged episode of excitement and confusion and was considered as unimproved. In another patient, after mild temporary improvement, severe hysteroid features again became evident. While the results were encouraging in 5 patients, increased excitement was observed in I patient and serial selzures occurred in another. The condition of these 2 patients was considerably worse during the period of treatment with tridione

Grand Mal Convulsions -Of 7 patients with idiopathic grand mal convulsions, only two showed marked improvement | Case 3 responded in only a moderate degree and became somewhat stuporous for a period of four days, although slie later showed improvement. The other 4 patients appeared to be worse following the administra tion of tridione Its administration was discon tinued in these patients. Case 7 developed stetus epilepticus In cases 4, 5, and 6 of this group serial seizures, confusion and/or stupor supervened The greatest percentage of toxic effects were found in the grand mal type, as six of the 7 patients manifested untoward reactions

The contrast between the results obtained and the milder grand mal scieures of the symptomatic group and the idiopathic grand mal types of convulsions discussed in this section is interesting All 6 of the milder spastic grand mal variety re sponded well to trichone and 7 of the 10 patients who manifested grand mal seizures in the spastic group improved In only one was a marked toxic reaction observed

Myoclonias -None of the three myoclonias responded favorably to the drug One patient (J W) suffering from the hereditary form was definitely worse. He became markedly confused and stuporous and the drug had to be discontinued (toxic reaction 8) In another case the continuous daily myoclonia was not diminished by tridione

#### Effects of Tridione

Evaluation of Results -The results obtained following the administration of tridione are sum marized as follows. In 23 of the 42 cases the response was favorable in 19 marked improvement was observed. The patients with cerebral palsies seemed most beneficially affected particu larly children and milder cases Eleven of the 15 or 73 per cent, of these organic symptomatic or palsy cases improved

Of the remaining 27 patients who may be classified as idiopathic or functional 12 or 44 per cent responded well About half of the patients with petit mal and psychomotor seigures were im proved Grand mal types and myoclonias manifested the least degree of amelioration of symptoms

Few of the patients in this series were very early or very mild cases. In all of them, seizure phenomena had been present for at least two years previous to the administration of tridione. Since many of these patients had not responded at all to other forms of therapy, tridione may be said to possess some ment. Further study to determine its ultimate usefulness is indicated. About 50 per cent of the patients responded better to tridione than they did to previous drugs such as phenobarbital and/or dilantin.

Evaluation of Toxic Effects—Our experience indicates that some of the favorable effects of the drug were counterbalanced by the untoward reactions which ensued The toxic potentialities of tridione must not be overlooked and the patients must be observed very carefully

In 10 patients the administration of tridione was discontinued permanently because of severe untoward effects. In 7 other patients, treatment with the drug was suspended temporarily but tridione was readministered in reduced dosage (0 3 Gm to 0 6 Gm) daily after a rest period of one week. A total of 32 patients complained of unpleasant side-effects during the course of the therapy

The side-effects were usually observed within the first two weeks of the administration of tri-In 9 patients delayed effects appeared during the second month of treatment but, except in 2 patients, these were of milder nature and were probably due to overdosage Temporary cessation of the administration of tridione or its administration in reduced amounts resulted in no serious side-effects However, the patients should be observed carefully for cumulative effects no case did toxic effects appear after another anticonvulsive drug previously administered had been gradually discontinued Patients who received dilantin concomitantly with tindione seemed somewhat more prone to toxic reactions tients who previously had received phenobarbital responded better

The untoward effects observed may be classified as follows

- 1 Ocular Manifestations While these occurred most frequently they were not the most alarming. The so-called glare phenomenon was noted in 24 patients. In 7 these subjective reactions, such as inability to see in bright sunlight, blurring of vision, white, milky, or green appearance of objects, and photophobia, were marked Dilatation of pupils occurred in 19 patients. In 1 patient a temporary papilledema was found However, in no case was the administration of tridione discontinued solely because of these ocular manifestations.
- 2 Increase in Seizure Manifestations Nine patients manifested an increase in grand mal

phenomena The most severe untoward effect was the occurrence of status epilepticus which was observed in 2 patients In 1 of these the outcome was fatal Serial seizures occurred in 4 patients In 3 additional patients there was a significant increase in the number and severity of Increase in petit mal seizures was the seizures noted in 2 patients In 3 there was an increase in One of these had rarely myoclonic seizures shown myoclonic reaction, but had four such attacks in the first month following the administra-Three individuals who prevition of tridione ously had manifested only petit mal seizures manifested grand mal phenomena

- 3 Increase in Mental Signs Untoward psychologic reactions and temporary abnormal behavior were observed in 6 patients. Three exhibited severe episodes of excitement. Four were markedly confused and manifested stuporous reactions.
- 4 Generalized Untoward Reactions A total of 32 patients manifested a combination of more or less generalized unpleasant reactions or sideeffects The subjective complaints observed are listed as follows

Irritability	11	
Fatigue and malaise	9	
Headache	9	
Drowsiness	8	
Nausea and gastrointestinal symptoms	6	
The objective signs were classified as follows		
Changes in blood pressure	32	
Changes in blood count	25	
Changes in temperature	22	
Dermatitis	6	
Albuminuria (transitory)	1	

In 24 patients the blood pressure was decreased by more than 15 mm of mercury In 8 patients it was elevated more than 15 mm In 4 patients the systolic blood pressure was decreased to 65 and in 3 patients the diastolic blood pressure was reduced to 40

The blood changes were of interest and were mostly concerned with the white cells. In 24 patients there was a 2,000 to 5,000 decrease in the white cell count. In 13 this decrease was transitory, but in 11 the depression of the white cell count was more than temporary. In 4 patients a temporary increase was noted. In 13 a white blood cell count of below 4,500 was observed, and in 3 the white cell count ranged from 3,000 to 3,500

Increase in lymphocytes and decrease in the polymorphonuclear leukocytes were noted in 17 patients. Decrease in lymphocytes and increase in polymorphonuclear leukocytes were observed in 11 patients. In 7 the blood smear revealed mild eosinophilia. In 8 patients the monocytes

The red blood cell count in were increased creased in 3 nationts and was temporarily diminished to 3 000,000 in 2 patients (a diminution of approximately 1,000,000 from the previous level)

The rectal temperature was below 97 5 F in 12 patients. It fell as low as 96.5 I in 3 of the patients. A temperature use of more than 3 \( \Gamma \) was observed in 10. Six patients complained of "chils and fover" In 4 patients the temperature exceeded 103 F and in the individual with exfoliative dermatitis it rose to 105 F

In 6 patients more than moderate skin reactions were noted. One patient developed a severe scarlatina-like rash followed by dermatitis exfoliativa Another patient developed a severe acneform skin reaction of the face accompanied by macular crythematous rash of the body

Summary of Severe Toxic Effects The sequence of tridione side-effects in the 10 pa tients experiencing severe toxic results was as follows a feeling of general malaise weakness headache, slight incoordination a feeling as if they were about to fall eye signs, dizziness, epi gastrie discomfort, or nausca, skin rash, fall in blood pressure, decrease in white cell count, or lymphocytosis, followed by a fall or rise in temperature or by a "chills and fever" reaction, irri tability, and drowsiness. After two or three days of more or less general manifestations or vague "all gone feeling" quite auddenly either serial seizures status and excitement, or stupor confusion, and prostration supervened In 3 patients hyperpyrexia or subnormal temperature and der matitus were present

The toxic conditions mentioned in the discussion and in the tables which finally caused the cessation of the therapy in these 10 patients are summarized in Table 1 in the order of their seventv

#### Conclusions

- Tridione appears to be more effective in cerebral palsies or symptomatic epilepsies, particularly in children with milder types of organic impairment or milder seizures and when the manifestations are of more recent origin.
- In the idiopathic group (a) It was of some Value in about half the patients with psychomotor

	TABI F (

1	1.	0 0 Gm	Status epiler ticus (fatal)	
3	МЯ	0 9 Gm.	Statu epilepticus following general- ized toxic reaction including de- crease in red blood cells of 1,000 000 dermatitis and hyperpyrevia	
3	A. B	0 9 Gm.	Serial seisures followed by stupor and confusion	
4	G F	1 2 Gm	Serial seisures followed by stupor and confusion	
5	E. O	0 9 Gm	Serial seisures followed by excitement	
đ	JC	0 0 Gm	Severely excited mental state	
7 8 9	11 1	0 0 Gm	Sev rely excited mental state	
8	7 T	0 9 Cm	Confusion and stupor	
10	K 8	0 9 Gm	Stupor and confusion accompanied by Ills and fever—authormal ten perature, fall in blood pressure 65/40 fall in white blood cells to 4 000 increase in polymorpho- nuclears dermatitis Derr atitis exfoliativa, accompanied	
_			by hyperpyrexia (105 F) increase n lyi inhocytes, a decrease in white blood cells of 5,500	

attacks and petit mal stupors. (b) it appears to be of least value in grand mal seizures and long standing invocioning

- Children and the milder cases responded better in all groups. The degree of difference in improvement in children as compared to adults in the idiopathic cases was not as marked as in the spastic types However the number of children in this series was too small to warrant any defi nite conclusion with regard to the idiopathic cases
- Tridione produces toxic effects and untoward reactions which necessitate careful observation of the patient preferably in a clime or insti tutional regimen Until the effects of tridione are better understood and its action more carefully established tridione should be administered with considerable caution. Fewer toxic effects were noted in children
- Tridione ments further study to establish its importance in the treatment of the epilepsies, as in 50 per cent of the cases the patients reacted better to tridione than they did to previous medication, such as dilantin or phenobarbital

#### INDIANA MEDICAL REGISTRATION

The State of Indiana recently has passed a law requiring annual registration, effective July 1 1947. The Secretary of the State Board of Medical Registration calls the attention of all Indiana registrants.

located in other states to the provision of this law, so that their licenses will not be revoked. For further information address Ruth V Lirk executive secretary 627 K. of I Building, Indianapoles, Indiana.

# THE TREATMENT OF LIGHTNING AND GIRDLE PAINS IN TABES DORSALIS WITH NIACIN

Louis Pelner, M D, Brooklyn, New York

ONE of the minor, yet baffling, problems of medical care has been the lack of effective medication for the lightning pains, girdle pains, and gastric crises of tabes dorsalis. These pains are of such severity that codeine and morphine often do not allay them. In severe cases, even chordotomy has been recommended for relief of these patients. In treating 2 of these unfortunate patients, I have used intravenous doses of macin (nicotinic acid) as a drug to produce vasodilatation. The results have been signally successful.

## Pathology

In spite of the fact that this disease is caused exclusively by syphilis, the method by which the spirochete produces the lesion is not known. In addition, none of the pathologic processes found in the spinal cord in tabes is pathognomonic for syphilis. The pathology that is found at necropsy is inadequate to explain why the tabetic crises come in attacks and are not continuously present.

The pathology as described in textbooks is usually that of tabes dorsalis in its later stages. The site of the early lesions is unknown. There is a degeneration of the posterior horn and posterior roots of the spinal cord. There is also a thinning of the spinothalamic tract. Changes in the anterior horn cells, roots, ganglia, and sympathetic chain have also been described.

Chordotomy has already been mentioned as a method of treatment of the lightning pains and other crises of tabes 1-3 There have been good results reported by the intraspinal injection of thiamin chloride 56 In reading the case histories of patients treated in this manner, the patient often seemed to experience a feeling of warmth in the extremities after the intraspinal Thiamin in large injection of thiamin chloride doses orally or subcutaneously was meffective One author reported that thiamin was useful intravenously 7 These considerations may mean that thiamin may be effective in the condition as a nonspecific drug

Gastric crises, another baffing symptom in tabes, has gone through a similar cycle of therapy Recently a patient with severe manifestations has been relieved by periarterial sympathectomy of the celiac axis and its branches <sup>8</sup> The end result was spectacular in this patient. Among the possible reasons for this successful result, the relief of vasospasm must be considered

Fever therapy and insulin shock treatment have also been used to allay the lightning pains <sup>9</sup> A degree of hypoglycemia which caused a slight somnolence and intense sweating succeeded in achieving an improvement in this condition Perhaps in these treatments vasodilatation was also the common denominator

Because of these theoretic points it was felt that macin might be tried for this condition

When it is injected intravenously in sufficient dosage, it uniformly produces a generalized vasodilatation. Subcutaneous injections and oral use of this drug are more haphazard in producing generalized dilatation.

## Method

The treatment used in this study was the intravenous injection of macin as the monoethanolamine salt, 50 mg per cc \* Injections were started with 5 mg and increased gradually twice weekly up to a maximum of 50 mg (1 cc) Within several minutes, a flush which lasted up to several hours was produced in each case After several injections the patient could dispense with analgesics. When the 50-mg dosage was reached, it was given weekly for four weeks After the injections were stopped, 100 mg of macin was given daily by mouth to prolong the effect.

## Case Reports

Case 1 -N W, a man, aged 52, first came under observation five years ago for a trophic ulcer and severe lancinating pains in the extremities was aware that he had lues fifteen years previously but had been treated madequately. In addition to the trophic ulcer, he had contracted, irregular pupils which did not react to light, and ataxia, Romberg's sign, and diminished knee jerks Tryparsamide was given for one year without effect, either on the trophic ulcer or the lightning pains Sodium iodide in full dosage was taken by mouth trophic ulcer finally healed with local treatment with penicillin soaks and ointments, and with sodium thiosulfate injected intravenously lightning pains, however, were not affected

Approximately one year ago macin was begun intravenously in a 5-mg dosage of the preparation described above. It was increased to 10 mg, then 15 mg, until 50 mg was reached. Injections were first given twice a week, then once a week for four weeks after the 50-mg dosage was reached. Ten

<sup>\*</sup> The preparation used was Nicamin distributed by Abbott Laboratories, North Chicago, Illinois

months ago all injections were discontinued but the pattent was placed on nacin tablets 100 mg per day. He has had no lightning pains since that time

Case 2 — M B a man aged 58 had lues when 30 years of age, but was treated only with several doses of mercury and bismuth His complaint was that he had frequent recurring, severe girdle pains encircling his left chest wall. He had the typical signs of tabes, i e positive Wassermann test of the blood and spinal fluid contracted, irregular pupils that did not react to light ataxia, and diminished knee jerks. Tryparsamide was given in full dosage for about one year, but this did not have any effect on the severe girdle pains. These would recur every few weeks and would last day and night for several days.

Niach was given intravenously exactly as in Caso 1 with signal results. The patient is now taking 100 mg of niach daily. He has been with out severe girdle pains for one and one-half years, although he does gut mild pains in inclement weather.

#### Comment

July 1, 19471

The two possible modes of action of macin are either as a drug to produce vasodilatation, or as a

specific vitamin in an avitaminosis. Both modes of action are possible in tabes, but most likely the effect is nonspecific. How visodilatation works to relieve the recurring seizures of lightning and girdle palas is unknown largely because the pathogenesis of these symptoms is likewise unknown.

#### Summary

Two tabetic patients having lightning and sovere girdle pains are reported as having been relieved by the intravenous injection of macin

#### NEW YORK UNIVERSITY INAUGURATES INSTITUTE OF INDUSTRIAL MEDICINE

Officials of New York University recently inaugurated the Institute of Industrial and Social Medicine as a unit of its New York University Bellevuc Medical Center, and announced that Dr Anthony J Lansa, one of the nation s leading authorities in the field of industrial health, will join the Institute as professor of industrial medicine.

The dual announcement came at a luncheon June 3 at the Harvard Club when medical directors of some of the nation s largest industries with representative labor leaders heard Winthrop Rockefeller and Dr Loo S Price, director of the International Ladies Garment Workers' Union Health Center hall the announcement as evidence of increasing interest in industrial health as a factor in world production.

In announcing the new Institute and the appointment of Dr Lansa Dean Currier McEwen of the New York University, College of Medicine, said the Institute will offer training for both professional and lay workers, and will award appropriate degrees. There will be in operation in conjunction with the

Institute a new general group practice clinic, staffed by members of the College faculty. The general clinic will be in operation by next fall, he said and will offer to wage carners a comprehensive program of medical care. He added that there will also be offered a graduate program, not only to qualified physicians, but to others wishing to specialize in the field. The Institute will also offer industry special services covering research in toxicology, physiology worker psychology, and tropical medicine.

A voteran of both world wars, where he propered in industrial health work, Dr Lausa holds the Legion

A voteran of both world wars, where he moneered in industrial health work, Dr Lausa holds the Legion of Merit and in 1946 received the William S Knud son award for the most significant contribution to the field of medicine. He is associate medical director of the Metropolitan Life Insurance Company

Dean McEwen announced that Dr Lanza will give voluntarily half time service until the end of 1948, after which he will be able to devote his full time to the new program of the College of Medicine. He will act as colinector with Dr Henry E. Meleney professor of preventive medicine

# A SIMPLIFIED TECHNIC OF TREATING SINUSITIS WITH PENICILLIN AEROSOL

With a Description of a Foot Pump for Economical Nebulization of Penicillin and Other Therapeutic Aerosols

ALVAN L BARACH, M D , CHARLES C RUMSEY, JR , MAY SOROKA, B S , and DORA RADER, PH G , B A , M S , New York City

(From the Department of Medicine, College of Physicians and Surgeons, Columbia University, and the Presbyterian Hospital)

N PREVIOUS reports a method of producing L negative pressure in the accessory sinuses during nasal inhalation of penicillin aerosol was described Specially constructed valves were used to change the direction of oxygen flow from a venturn so that positive pressure was produced for nebulization of antibiotic drugs and negative pressure to withdraw air from the sinuses for subsequent replacement with penicillin aerosol 1-3 The source of negative pressure was derived from the side-arm of a glass (or metal) venturi tube which was itself connected by pressure tubing to an oxygen regulator As oxygen passed through the vertical length of the venturi, the constriction at its distal end created a negative pressure in the horizontal arm The valves were used to switch the delivery of ovygen through the nebulizer. when penicillin aerosol entered the nose, to the source of negative pressure, which was transmitted to the sinuses

Recent study of the apparatus indicated that the valve may be eliminated. Rubber tubing connects the horizontal arm of the venturi with the nebulizer, which is in turn connected with the glass trap and nosepieces, as seen in Figs. 1 and 2

The treatment is conducted by first holding the thumb over the distal end of the venturi, thus forcing oxygen through the nebulizer while the patient takes three or more breaths through the mouth, filling the nasal passages with penicillin aerosol. When the finger is removed, oxygen passes out of the open end of the venturi tube, and a negative pressure is transmitted directly from the side-arm of the venturi through the nebulizer to the nosepieces, nasal passages, and sinuses

Since a small amount of penicillin enters the venturi during the negative phase, it should be rinsed daily with hot water to prevent clogging. The nebulizer may be cleaned similarly each day

A flow of 5 to 10 L per minute is used to provide suction as the patient swallows, when the finger is released from the venturi tube. The venturi varies somewhat with different manu-

facturers, that flow is used which provides recognizable suction in the nose \*

The technic described substantially reduces the cost of the original equipment, since the valve is not used

The use of oxygen from a high-pressure cylinder has several advantages for continuous nebulization of penicillin solutions, namely, effortless delivery of the aerosol, the physiologic effect of ovygen in cases of pulmonary insufficiency, and the opportunity for a precise regulation of the flow of ovvgen desired However, for patients of limited means treated at home, the cost of rental of equipment and of oxygen is at times burdensome more economic method consists of the employment of the foot pump customarily used to inflate automobile tires as the source of pressure for aerosolizing penicillin, either for oral or nasal inhalation, the latter in conjunction with the negative pressure technic described above for the treatment of sinusitis 1-5 The handbulb of the conventional nebulizer may also be used if a small amount of solution is employed, such as 0 25 cc of water containing 20,000 units of penicillin cc \*\* The foot pump contains a piston which can be compressed by the ambulatory patient who is not acutely ill or enfeebled by severe, chronic disease Under the latter circumstances, it would be possible for a member of the family to operate the pump if the expense of oxygen equipment were prohibitive

The foot pump is mounted on a sponge rubber base or bath mat to prevent it from slipping on the floor. As seen in the accompanying illustration (Fig. 3), it is connected by pressure tubing to the nebulizer which is employed for aerosolizing

This communication is derived from a study of inhalation of pencillin aerosol supported by the Josiah Macy Jr Foundation

<sup>\*</sup>The assembly may be obtained from the Inhalational Equipment Company, 248 East 119th Street New York City the Oxygen Equipment Mfg Corp., 405 East 62nd Street. New York City, and the Vaponefin Co. 6812 Market Street Upper Darby, Pennsylvana These firms may also supply the automobile foot pump

<sup>\*\*</sup> Highly concentrated solutions such as 20 000 units per cc may be employed when a crystalline tablet is inserted into the nebuliser which prevents the waste that would ensue if it were transferred from an ampule by syringe. The tablets are supplied by Premo Pharmaceutical Laboratories, Commercial Solvents Corporation and Bristol Laboratories

Fig. 1

the solution A rebreathing but may be used with the nebulizer to permit reinhalation of the acrosol not absorbed during the first inspiration

The patient presses his foot downward on the piston during inspiration and raises it during expiration

With the sinus apparatus, which provides negative pressure for evacuation of air from the sinuses and replacement with ponicillin acrosol, the foot pressure is used both for delivery of penicillin abulin and for subsequent development of negative pressure. The venturi tube is opened, thus connecting the patient's masal passages with the venturi that produces negative pressure as the foot compresses the piston. When the tube opening is closed by the thumb compression of the foot pump directs air through the nebulizor and produces a mist of penicillin in the nasal passages and lungs.\*

The effect of oral inhalation of 50 000 units of crystalline sodium penicillin on the blood level in 12 patients with bronchopulmonary disease, shown in Table 1, averaged 0 17 unit of penicillin per ce of serum after one hour, which compares favorably to the findings in a large series of cases in which nebulisation of penicillin was accomplished with oxygen. The crystalline sodium or potassium salt is unquestionably superior to the usual calcium or sodium salt previously used since it is less apt to provoke cougling and uniformly is followed by higher concentrations of penicillin in the blood

The inhalation of 50 000 units of penicillin in 1-cc. physiologic saline is followed by a rinse of 1-cc saline (or 1 per cent necesynephrin in cases

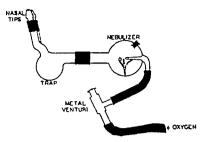

Fig. 2 bumplified negative pressure sinus unit

Fro 3 Foot pump for penicillin aerosol administration

with bronchospasm) to dissolve penicillin clinging to the small glass tubes. At the end 0.5-cc, saline or water is inserted into the nebulizer and allowed to remain until the next treatment. Unless a rinse of this character is carried out, approximately 30 to 40 per cent of the introduced ponicillin remains in the nebulizer and would be lost if the nebulizer were washed between treatments.

Vaporization of water from pencillin solutions due to nebulization by div oxygen results in a more concentrated solution of the drug in the nebulizer at the end of an inhalation. This is much diminished by passage of oxygen through a metal water bottle but the latter is not necessary as the saline rinse refusedves the concentrated pencillin. With the foot pump or handbulb air is used which contains water vapor in proportion to its relative humidity, and thus to some extent provents concentration of the drug. Sa

In some aut obile foot pumpe the piston is lubricated with graphite which enters the air stream, for this reason the air bould pass through a glass tube containing wood or ootton to filter out the dust particles or the pump hould be cleaned carefully before purchase

Commercial bolvents Crystalline Penicillin

line rinses, however, are still used to dissolve the greater part of the penicilin that adheres to the inner surface of the nebulizer

An incidental advantage of air over oxygen in the treatment of sinusitis is the fact that due to the absorption of oxygen from the Eustachian tube after treatment and the production of a slight negative pressure until air gradually diffuses into the tube, the ears do not develop the stuffy feeling which occasionally takes place when ovygen is employed

Since the function of the rubber bag in the apparatus used for the inhalation of penicillin aerosol has not been comprehended generally, it seems worth while to discuss this subject briefly Penicilin aerosol may be inhaled without the bag, the nebulizer being held within the mouth as the patient inhales the mist during inspiration is accomplished by the device of closing the open end of a Y-tube inserted in the rubber tubing from the nebulizer to the regulator at the start of the inspiratory cycle and removing the thumb at the end of expiration. The same purpose may be accomplished by turning the nebulizer on the side during expiration so that oxygen passes through it after the solution has been removed from contact with the small glass tube through which it is aspirated in the vertical position

Under these circumstances penicillin suspended in expired air is exhaled into the outer atmosphere, approximately 50 per cent of that which is In patients who are able to hold their breath after inspiration has been concluded, additional deposition of penicillin will take place in the lungs

Breath-holding is not possible for dyspneic patients, and becomes trying for the vast majority of others In order to afford the opportunity of reinhaling some of the exhaled penicillin aerosol, an enlarged glass bulb and later a rebreathing bag was used During expiration the patient delivers the unabsorbed penicillin mist into the rebreathing bag and during the succeeding inspiration inhales freshly produced penicillin

aerosol along with some of the aerosol from the rebreathing bag This may achieve a significant saving of the drug, especially in patients who cannot time their respiratory cycles accurately by placing a finger over the open end of the Y-tube at the very start or just preceding the act of in-The nominal expense of the rebreathing bag and glass tube connection is then counterbalanced by the loss of penicillin during respiration when the rebreathing technic is not em-The amount of rebreathing is limited naturally by the flow of oxygen, thus there is greater washing out of carbon dioxide and acrosol by a flow of 10 L per minute than at 6 to 8 L There is, however, no objection to dispensing with the rebreathing bag and using the nebulizer alone in cooperative patients

When the mask nebulizer apparatus is cmployed, penicillin may be nebulized continuously. with loss of the drug occurring in expiration, or use may be made of the demand valve nebulizer, in which penicillin aerosol is automatically produced during inspiration only During misk breathing it is desirable to instruct the patient to breathe through the mouth, or put cotton in the nose, as otherwise half of the penicillin inhaled is deposited in the nasal passages

## Summary

A simplified technic of producing negative pressure during nasal inhalation of penicillin aerosol is described for the treatment of acute and chronic The specially constructed valve previously reported is not necessary with this method

The use of an automobile foot pump is described for economical nebulization of penicillin aerosol, used either with oral inhalation of the drug or in conjunction with negative pressure during the nasal inhalation of penicillin ovygen from a high-pressure cylinder is preferable generally because of effortless delivery of the aerosol, this device is useful for patients of limited means since the cost of rental of equipment and ovygen at home may be dispensed with

Effective penicillin blood levels have been demonstrated after inhalation of 50,000 units per cc of normal saline by this method

#### COOPERATION BETWEEN PATIENT AND PHYSICIAN

The Essence of Good Medical Care, Individual or Collective

HAVEN EMERSON M D , New York City

S RUDYARD KIPLING said some thirty  $\Omega$  and more years ago, the people of the world are divided into two classes patients and doctors In our own country the patients, i.e., the 90 9 per cent of the people through their elected legislators authorize the 0.1 per cent to practice medicine after giving evidence of possessing at least a minimum of knowledge and skill in the accences and arts required. The patients the people then permit a lot of other practitioners of the healing arts without even that minimum of knowledge required of physicians to offer their services to the sick, this is politically expedient but not intelligent The examination of physicians for the privilege of practicing medicine under the law is by physicians or nonmedical representatives of the basic sciences required in the medical curneulum

The educational policies methods subject matter, and teaching in the schools of medicine are the undertakings of physicians or nonmedical representatives of the basic sciences

This education of physicians before they can be heened to practice among the people, and the subsequent training of the recent graduate in hospitals and the still later postgraduate study by physicians for higher and specialty qualifications is all done under the control of physicians and their colleagues in the basic sciences

The people voluntarily and through taxation have supplied the financial resources for schools of medicine with their related hospitals laborationes and research institutions, and, yet, the cost of the medicial students education is higher than that of any other profession or occupation, not only to the institution of learning but in the matter of tution fees to the student and in his years of life

Once the physician is licensed to practice medicine he may live and work wherever he finds conditions to his liking, socially, economically culturally, or professionally and he is thereafter under no compulsion of law to pass examinations as to his competence or to alter his place of readence, so far as the latter is within the jurisdiction of the state or national board of examiners which passed upon his original qualifications

Briefly, then, the people, having set up what they consider sufficient formal requirement to protect themselves against grossly incompotent practitioners of medicine, have trusted to the wisdom of medical faculties and to the ambition and self-interest of physicians the education and distribution of practitioners of medicine to meet the needs of the sick

The experience of the people of the United States has been, on the whole, favorable under the present conditions which cannot be properly desembed as a system, physicians being now better educated, more widely distributed and in higher ratio to the population in our states than has been the case heretofore with any similar number of people in other lands or under other methods of control education, and distribution of physicians We can note properly in this connection that every index of health or relative freedom from preventable diseases and of longevity reyeals a state of affairs in the United States an perior to that of any such aggregation of people or of races elsewhere under single or multiple govern ment.

Two major complaints have been brought against the present medical care of the sick in our country, namely the unovenness of its availability geographically for some portions of our population and the cost of services of physicians and of medical institutions which are beyond the day-by-day resources of a large number of the sick to meet out-of pocket, or at the time of sickness and the receipt of the medical services.

It is to the correction of these that our first efforts should be directed to the end that sickness may be diagnosed correctly, and humane and skillful treatment be applied, wherever people are, regardless of the ability of the sick person to pay on the spot for the medical care required. This is a high ambition and worthy of the best brains and spirit of our times

Lest you think I have foresworn that particular field of medicine to which I am chiefly devoted, let me say that public health services as technically defined and provided for under austing local and state jurisdictions of civil government, offer the application of the sciences of preventive medicine through or with the consent of government for social ends. Public health is a community asset not a personal service. Public health is a social ambition to which the authority of sanitary laws and ordinances, their enforcement, and the force of public education and opinion contribute but individual and personal health is quite as much

Presented at a meeting of the Cooperative Health Group
Two Harbors, Minnesota, August 17, 1946

the product of physician-patient relationship as The term public health is is care of the sick loosely and improperly used to cover care of the sick by public authority or through tax momes, but it will clarify our thinking at this time, I believe, if we distinguish between the primary purpose of the physician among the people, which is to relieve suffering in sickness and aid the recovery of the sick individual and see that the approach of new life and of death receive all humane consideration and care, and the functions of physicians and others responsible for organized efforts for the control and prevention of the preventable diseases and the promotion of health in the mass by the use of authority and education Public health services authorized by civil authority are the background, the landscape of preventive medicine within which personal health is Personal health is the composite product of heredity, environment, individual character, and choice of conduct, and the following of the advice of that practitioner of human biology. the family physician

Health and its maintenance, its development, betterment, and protection differs essentially from sickness and its care in the economic and actuarial sense. The state of health is not an insurable risk, because at any moment a person insured may declare himself sick and claim benefits in money or kind, and no one can say him nay, or effectively declare him to be in health if he feels himself to be sick. The hazard of sickness is, to a degree, calculable as to its occurrence, duration, outcome, and cost

Insurance that means are provided to meet the costs of medical care of sickness is an honest and practicable project for thrifty people to undertake. Medical care of the sick offers the best opportunity to give guidance in personal health on the basis of a competent medical opinion as to the condition and capacity of the individual to achieve, or maintain, or improve it

Let us from now forward discard the dishonest. politically expedient, but misleading and intellectually deceptive, and confusing term health insurance, and commit ourselves, at least in the present state of our immediate and pressing concern, to insurance that medical care will be available and will be paid for Sickness insurance is understandable, although less precise a term than medical care insurance "Health msurance" in the sense of Lloyd George, of Beveridge. of that trio of impracticable political propagandists, Murray, Wagner, and Dingell of the 1946 vintage, is a term false and misleading, and implies medical services that cannot be delivered and promises that cannot be kept under any financial or administrative structure so far proposed

Neither public health nor personal health has been appreciably bettered by the introduction of the so-called health insurance plans in other lands, nor would it be as proposed for the people of the United States of America

We are here concerned with means by which care of the sick, which always should include personal guidance for health, can be more widely available and at a cost which the well rather than the sick can meet through prepayment plans by groups of persons over a period of time

There are two well-tested means by which the first objection to present conditions can be re-Physicians will go voluntarily to serve all people and to study sickness and its causes under even distressing and poor conditions of a social and cultural nature, if there is provided in the community or region a hospital, a wellequipped and staffed shop or medical power station where modern resources for aiding the diagnoses and treatment of disease are provided, and there is a group, which need not be more than half a dozen, perhaps only three, physicians serving the local hospital as a professional unit Such institutional and regional professional oiganization can be achieved for all but the most remote and sparsely settled parts of our country, with resources already planned for, and now actually authorized and appropriated to the Federal Government by the Congress (The Hospital Survey and Construction Act) and by the states, each state to report, after survey, its own particular necessities and present limitations in this respect Operation of hospitals for general sickness and for maternity care should be a charge upon local and state resources, not upon federal funds

Where the economic limitations of the people are extreme, as for instance where the per capita spendable income in the county or region is \$200 per annum or less, some form of public underwriting must be provided to offer the physicians salaries sufficient to attract and hold men of good character and education When, and if, the economic situation changes to permit the people to pay individually or collectively for the physician's personal services, the amount of the subsidy or underwritten salary would be reduced in proportion Distribution of physicians in proportion to the number and need of population groups should be natural and automatic and would probably be so throughout our country if the handicaps of no hospital facilities and inadequate income for the physician did not affect his choice of location to the disadvantage of the poor and lowly A temporary shortage of playsicians due to war and postwar military service and veterans' care demands has aggravated and emphasized the low ratio of physicians to population in many rural and low income areas of our country

The other complaint, that of a cost of medical care beyond the immediate means of the sick or their families, is being studied and overcome gradually for an increasing range of income groups, disease conditions, and kinds of medical nursing, hospital, surgical, and maternity servaces

The final solutions that are offered, if there be anything final in our times in a field of such wide variety and rapid social and scientific development, follow two distinct and incompatible organizational patterns and philosophies, the one based on compulsion and authoritarian control by government of the amount and quality of medical service, and of the cost of medical care and the manner of its payment which tends to become increasingly a direct charge upon general tax resources, and, the other a method of or gamzing and paying for some or all kinds of medical services by physicians and medical in stitutions through voluntary associations and insurance agreements between the consumers and the producers of medical care. Thus is our faith and resourcefulness and progress under our form of government put to practical test service plans undertaken for commercial profit or others by voluntary actions of individuals and groups are classified by Dr W P Dearing under five headings commercial insurance industrial medical service plans, private group clinics and consumer-sponsored plans community medical plans, and rural plans of the U.S Department of Agriculture.

It would appear from the incomplete evidence and records available that the group practice units furnish the best and cheapest medical services from the production point of view. For the other four varieties, the present interest is more in the financial structure than in the quality and results of medical care. It is well said, and in fact a fortunate blessing, that in a field of socioscentific endeavor so young and untried there are no experts.

Never was there a problem urgently demanding practical solution so apt and suitable for coopera tive approach by the two kinds of people defined by Rudyard Kipling the patients and the doctors the consumers and providers of medical care.

One cannot pick up a live publication dealing with the social and financial problems of medical care without finding enthusiastic description or overwhelming disapproval of some new experiment. The American Journal of Public Health

Controlled experiment, critical analysis and interpretation, corroboration, or the contrary, and logical reasoning on results are gradually replacing the quite hysterical political propaganda of the proponents of early national compulsory sickness insurance which has created a trail of disillusion, despair, and defeat for medical progress wherever it has been imposed upon a people in the name of public health welfare, and social justice. The buyers and sellers of medical care patients and doctors, are increasingly dealing directly with each other without government intervention.

We are here concerned with further and more promising experiments and even at the risk of repetition, I would wish to emphasize certain principles of relationship between consumer and physician groups which seem to me to be essential to any sound cooperative medical care undertaking

As the practice of medicine must always be an experimental and opportunistic profession because of the infinite varieties of sick persons and of the manifestations of disease, so we must in our social endeavors in this field accept the certainty of a wide variety of possible and practicable good, appropriate devices of service and pay ment, rather than submit to the anesthetic in fluences of a single pattern imposed from Wash ington and forced into uniformity of adoption by the power of centralized control Freezing of the warm enthusiasm for better quality and distribution of medical care, permeating every state and local community today by the glacial momentum of a federal pattern, which neither technical proponents nor legislative salesmen understand themselves as to its effects on patients and physicians, would be a cruel blow alike to the sick and their medical servants

Let us go forward with confidence in the value of forty-eight experiment stations in state government and in the unnumbered local social and economic groups who are striving for what is best in medical quality and at a cost they can meet. We should thank our bright stars that we are a federation of sovereign states with the certainty that there is no indigenous superiority of wisdom in Washington, but only the experience and resourcefulness of the home farm shop and cultural circle reflected remotely in the federal personnel and policies

Mutual trust confidence in frankness, and honesty of purpose of patient and physician are essential even before the use of laboratory tech-

of August, 1040, offers three plans for medical care under official auspices of a provincial, a state, and a city government, the patterns being radically different but each, perhaps, to be well received by the respective populations of Manitoba and Maryland and New York City

<sup>&</sup>lt;sup>1</sup> Dearing, W Palmer Am. J Pub Health 36: ~69-886 (July) 1946

nologies If there is the least barrier, reservation as to facts of history or symptoms on the part of the patient, or any shred of selfish or ulterior purpose in the questions and search for causes and facts of pathology by the physician, medical care ceases to meet its opportunity and obligation

In the same spirit and to the same end must every group or social effort for a better medicine and for bearable costs enter the discussion. The individual physician, the two or more in partnership, the medical staff of a hospital, the medical society of a county or state must meet the person, the group, the local welfare agency, the community as a whole, or in its self-preferred separate parts, the cooperative, the labor union, the employer, or management as nearly as possible in the manner and with the thoughts, hopes, and ambitions of the doctor and patient in office or at the bedside

Nothing less than the utter and comprehensive truth on each side can be acceptable. Each must be free. No one else may intervene, or determine, or control unless the patient wishes consultant or corroborative advice, and the physician is ready to accept such added presence. If the physician seeks added counsel the patient must consent. Either must be free to cease relations if these are not mutually acceptable.

May I suggest to patients, as a group of persons hoping or authorized to bring about some insurance plan for medical care, that they would be wise to consult persons with experience. rather than those with a theory to sell select a professor of the history of medicine with little or no experience in any kind of medical practice and a mere novice in American medi-Avoid a born and bred devotee of Teutonic governmental medicine, exiled by choice from his native land where his main employment was promoting and managing the medical plan that has been a major cause of two generations of medical deterioration in that very country eschew, even among our own physicians, those with but a minimum of the know-how and personal experience with medical care, although they may be endowed with a gift of ready speech Last of all, avoid lay persons of the philanthropoid type, whether in personal or organized voluntary or government service committed by the source of their income or by an order from the President of the United States of America to follow a line of thought, conduct, and expression Any one of such persons, whatever their university or government sponsorship, is less safe as consultant and adviser on medical care plans than are physicians and managers of hospitals, group clinics, and medical society projects, who have actually got down to the maternal facts of the situation and worked out a solution that is at least a going concern for care of the sick

When your watch is out of order go to the watchmaker, not to the plumber or carpenter

It is a primary function of the medical member to organize and provide the services. The patient partner can well devote himself to developing resources and methods of payment. Cooperative, shrewd, thrifty, critical adjustment between these two, without threat of strike, boycott, majority power, or recourse to political intervention should be possible over and over again under almost any of the different conditions characterizing our various communities and economies

The group clinic has been but the logical development out of the great benefits familiar to the organized medical, surgical, obstetric, pediatric, and consultant staffs of good general hospital and outpatient services

A consumer cooperative should be encouraged to undertake the sponsorship of a group clinic as hospital trustees accept responsibility for holding and operating a hospital, in each instance, the medical policies and standards of service being left to the unconditional determination of the physicians who accept positions on the staff The medical partner in the plan can more easily assure himself or themselves of the financial responsibility of the patient partner than can the latter feel confident that professional services are guaranteed as to quality by group discipline among the physicians, or through standards set up and, to a degree, enforced by organized county and state societies or by professional boards and associations

It is elementary that the medical group will assure the patient partner that no physician will attempt care of the sick outside of the field of his accepted competence

Whatever prepayment, or cooperative insurance plan is voluntarily undertaken must be inclusive, ultimately, if not at the outset. The patient, the person to be served, is a continuing altering, aging, growing, bearing, creating personality, requiring any or all the modalities of medical and associated care at any or all times, but needing these so far as possible in continuity, ie, under medical auspices that permit accumulated acquaintance with the patient's biologic picture and record over the years, and not merely episodically, for the brief times of acute invalid-Office, home, and hospital, outpatient, visiting nursing, convalescent, rehabilitation, dental, vocational, medical social service, laboratory, longtime care, and many another type appropriate to the patient's special need will have to be included if social and economic mechanisms

are to eatch up with the complexities of modern medical care. All under a single direction would be theoretically desirable but there is no basic reason to forbid the patient's participation in several plans, each fractional, if at some point there is the directing mind and heart and record that deals with the whole patient over the years. The good general practitioner and group clinic does this now.

It is taken for granted that medical plans like persons will have to share in the services of specialists, as few will be able to command, nor should they expect to control, the exclusive services of the brain surgeon who meets the needs of a million people, or the eucephalographist who is still rare and hard to find. Specialization will exist within the medical group and specialists will be called upon from the outside, but the decision as to need of specialty services should rest with the medical partner.

Medical care plans can with advantage originate from either party, being as properly born out of the desire of the doctors of the community for better scientific and economic efficiency as from the urge of patients to get better care within their means. Medical plans, since 1939, show a sturdness of growth comparable to but later than that of subscriber hospital plans of 1932.

Industries may fill the needs not met by other consumer groups but the principles will remain the same if good care, wide scope of service low administrative costs, and suitable payment of the producer group are achieved Labor umons themselves seem to prefer physician-operated plans, as must be the way if local government agrees to have the indigent sick so served

While so-called health education is a function of official and voluntary health agencies, and best through personal contact between the visiting or public health nurse and the family in the home there is a vast unreached audience, and a great mass of useful information which can be distributed only through the personal relation between the physician and patient, and of course through the mechanisms of intercommunication between subscriber consumers and the medical group they rely upon for medical care

Without laboring the matter unduly and to your unavoidable fatigue let me express my conviction yes merely a personal opinion that the cooperation of patients and their physicians in self-chosen groups can and will solve the problem of high quality of medical care and its sound financing without loss of any freedom or the intrusion of the Federal government between the two parties concerned It would appear that some nation-wide method, though not federal or national in origin will presently appear as a pattern for prepaid medical care. If such a plan is

to succeed it must have a place for autonomous cooperative organizations with the same purpose

It would seem proper, although not yet formally so declared by the United Nations through its official spokesman, that care of the sick and the relation of patients to physicians be accepted as concerning individual nations and not a problem for international promotion or determination. If federal and state governments are to be used as sources of revenue to meet local community costs of modical care of indigent or low income groups, there will be greater economy and efficiency of service if the funds are applied to existing approved voluntary programs, than if local government jurisdictions undertake added organizations for medical care under their own auspices

To avoid any possible misunderstanding of my personal opinions let me say that I believe any and every federal attempt to compel our people to support and the medical profession to serve a system of sickness insurance under whatever name should be opposed until Congressional consideration of such an undertaking is definitively abandoned. Time and the occasion do not permit detailed arguments against compul sory federal sickness insurance as so far proposed by legislation now for the second time more bund but not dead

The major points to be emphasized in developing increasing opposition to the Murray-Wagner Dingell bill until it is put permanently in the discard of things unwanted and unwise seem to me to be the following Such legislation if enacted would in my opinion

Lower the quality of medical care

Increase very substantially its cost

Create an administrative political bureaucracy Weaken sense of public independence locally and in states

I'ml to satisfy the demands for better medical care at less cost

Reduce the availability of physicians in wide areas

Make less efficient use of existing professional personnel

Fail to increase the number or improve the quality of the members of the profession in volved

Postpone almost indefinitely sound solutions of the problem under voluntary auspices

Repeat in the most intimate of all personal and confidential relationships that between physician and patient the blundering ineptitude chicanery and waste which have characterized each extension of the federal government into personal affairs for other purposes than taxation and the maintenance of law and order

To make any such legislation inexcusable and impossible, it is our immediate and continuing obligation to use all our individual and collective brains to provide for medical care through voluntary organizations of patients and physicians

Let us study the catastrophies in New Zealand and Australia, and learn from England's plunge whether again the British genius for muddling through will help us, but, by all means, let us prevent the fixation of a revolutionary blunder upon our own people in the name of social progress. Such action in regard to the voluntary hospitals as Britain has decided upon would be in this country at least a step backward and downward

The opinions I have expressed, I believe, are shared by more than 95 per cent of the medical profession in our country, and if the facts of the matter were as well understood by the people, well and sick, as they are by their doctors, and

there were any way of their expressing themselves freely on the matter, it might well be that similar opinions would be voiced by a similar majority of the people

In closing, may I refer to the relationship between prepaid medical care and general com-The health status of any community health munity cannot fail of striking and continuous improvement whenever the official authority and educational resources of the local department of health are supplemented by the services of physicians, nurses, and medical institutions for the sick made available to meet every reasonable need, and by the public spirit of a people wellinformed, self-directing, and organized to get the best that the medical sciences and services have to offer for treatment and prevention the kind of community which I conceive the Cooperative Movement is committed to create

#### PEDIATRICIANS TO HOLD CONGRESS IN JULY

With the United Nations struggling to share atom secrets that may destroy humanity, 2,200 leading child specialists from 50 countries will assemble at the Fifth International Congress of Pediatrics at the Waldorf Astoria, New York, from July 14 to 17 to share medical knowledge that should help preserve humanity. This year marks the first meeting of the Congress in America. Four previous Congresses have been held in Paris, Stockholm, London, and Rome.

Fourteen hundred delegates from Canada and the United States, 450 from Latin America, 250 from Europe, and 100 from other continents are expected Officially sponsored by the Pediatric Section of the American Medical Association, the American Academy of Pediatrics, the American Pediatric Society, and the Society for Pediatric Research, the Congress is stressing the One World theme in all its activities, recognizing that world health is an important factor in world cooperation.

The scientific advances made in pediatrics in the United States and other countries during the war period will be made available to all to insure the health of future generations. Pediatricians from all over the world will profit from learning how America

has applied pediatrics in private practice and in the public health field in decreasing community disease, instituting child health clinics, day nursenes, milk pasteurization, new feeding methods, etc. And American doctors will profit from the lessons taught to Europeans by the war ravages to child health.

The president of the Congress is Dr Henry F Helmholz of the Mayo Clinic in Rochester, Minnesota Two New Yorkers constitute the other officials of the committee—Dr L Emmett Holt, Jr, professor of pediatrics at New York University and chief of the pediatric staff at Bellevue Hospital, and Dr Donovan J McCune of the Babies Hospital at Columbia Medical Center

An outstanding feature of the Conference, according to Dr Rustin McIntosh, professor of pediatrics and Head of the Babies Hospital, will be accounts of the studies that have been made of malnutration among German, Dutch, Norwegian, and Danish children during the war

The American pediatricians, according to Dr McIntosh, believe every effort must be made to help foreign physicians at this critical time of conversion from the World War Era into the Post-World War Era

# WATERHOUSE FRIDERICHSEN SYNDROME COMPLICATED BY ACUTE PERICARDITIS. WITH RECOVERY

ISTOORE STEIN MD, Brooklyn, New York

THERE have been comparatively few reports of acute pericarditis complicating meningitis. Winslow and Shipley studied 62 cases of purulent peri None of these showed carditis bacteriologically meningococci. In reviewing 88 cases of meningococcemia, Campbell' cites only 1 with involvement of the pericardium Smith and McHugh! state that among 87 meningococcal infections 36 of which were accompanied by meningitis pericarditis was a complication in three instances Hernek<sup>4</sup> experi enced this type of cardiac complication in 12 out of 280 cases of epidemic cerebrospinal moningitis With only one exception the meningococcic peri carditis occurred in very severe cases and while the mortality of the entire epidenic was 24.8 per cent the mortality of the cases with the pericarditic complication reached 83.5 per cent Only 2 of these cases were recognized clinically as meningococcio penearditis Trace and Berkovitz' report one in-At Regional Hospital, Fort Ord California, there was 1 case of pericarditis among a group of 76 cases of meningococcic meningitis. This case has been considered worth reporting because of the infrequency of this type of complication and because the patient made a recovery from so fatal a diseasa.

Case Report

An 18-year-old white man was first seen on Feb 17 1945 at which time he presented a history of generalized aches, chills fever, sore throat and vomiting for several days provious. Drammation at that time roveraled essentially an acutoly ill patient, with a temperature of 102 F pharyngeal congestion and a slight degree of nuchal rigidity. Blood pressure was 72/50 pulse 144 and respirations, 30 A lumbar puncture revealed clear fluid under normal pressure, sugar 68 mg, per 100 cc. 12 cells, 3 polymorphonuclear leukocytes and 0 lymphocytes. White blood count was 27 500 with 87 per cent polymorphonuclears. The patient was given plasma, thamun chloride and 20 000 units of penicilin every three hours.

of penicilin every three hours
On the following day (February 18 1045) at 3 00
A.M. he took a sudden turn for the worse quickly
lost consciousness, and assumed an extremely agi
stated state, thrashing and kicking about wildly
To quiet him sodium amytal was administered in
travenously. At this time there were noticed in
merous homorrhague bullae scattered diffusely over

merous homorrhague bullae scattered diffusely over his entire body. The blood pressure was 130 per 92 On February 10 the temperature was 104 F and a spinal puncture revealed a turbid fluid. The blood culture taken on the previous day showed a growth of meningococci. In addition to the penicillin both intramuscularly and intrathecally and plasma, he was now receiving sulfadiashie and adrenal cortex. He remained comatose and irrational until February 23 1045. On that day the spinal fluid was clear. The skin lesions began to break down leaving scattered necrotic areas. From February 27 on his symptomatic improvement was mpid. How ever, on March 9 a percardial friction rub was heard in the left anterior chest. This disappeared two

days later There was no chest pain nor difficulty in breathing during this interval The skin continued to desquamate and was replaced by normal epithelium. He gained strength progressively and when last observed on July 17 (five months following the onset of his illness), he felt well except that he tired more easily than prior to his sickness

tired more easily than prior to his sickness.

Laboratory Studies — Urine and scrology (Kahn test) were normal. The original white blood count showed 27 500 cells with 87 per cent polymorphonuclears On February 21 the blood showed a growth of gram-negative diplococci typical of Acissoria. Subsequent spinal punctures revealed fewer and fewer cells and all pathologic elements disappeared by February 23. Roentgen studies of the chest were consistently negative. At no time was the presence of a pericardial effusion demon strated

Electrocardiographic tracing taken on February 18, while the patient was disoriented and in a semi comatose condition revealed a tachycardia, blphasic T2 and inverted T3 (Fig 1) On February

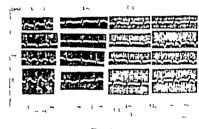

Fig 1

26, in addition to the above, T4 was also of low voltage. The cardiogram of March 5 indicated low voltage T waves in the limb leads and biphasic T4 At the time these aberrations were predicated on a toxic basis. On March 12 marked changes were noted in that all the T waves were inverted with alght rounding of RT2. This configuration per stated until April 2, when T1 and T4 were biphasic and RT2 slightly elevated (the rounding was not present) (Fig. 2). On April 9 T1 2, and 3 were inverted and T4 biphasic Tracings from May 11 on were essentially normal except for low voltage of the T wave in the second lead. Although the disappearance of the abnormal picture was alow, the scrial tracings described above were considered indicative of percarditis

#### Comment

This patient presented the picture of the so-called Waterhouse-Friderichsen syndrome "namely acute onset with high fever prostration, and unconsciousness, together with diffuse purpuric manifestations and overwhelming sepsis resulting from a meningo

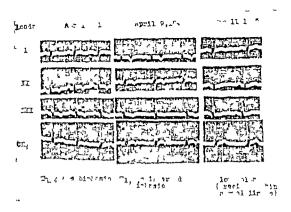

Fig 2

There were no symptoms related coccus infection to his pericardial infection, signs of which appeared during his early convalescence (twenty-two days after the onset of his illness) The diagnosis was predicated on the basis of the friction rub and the changing electrocardiographic pattern

markable recovery was undoubtedly due to the use of sulfadiazine and penicillin

#### Summary and Conclusions

A case of recovery from the Waterhouse-Friderichsen syndrome is reported The patient was treated with sulfadiazine (intravenously and later orally) and penicillin (intrathecally and systemically)

An unusual complication, pericarditis, was 2 noted and serial electrocardiographic studies were

#### MAJOR GENERAL BLISS NEW SURGEON GENERAL OF ARMY

Mai Gen Raymond W Bliss is the new Surgeon General of the Army, succeeding Maj Gen Norman T Kirk. His four-year term began June 1

Since January 1, 1946, General Bliss has served as Deputy Surgeon General General Kirk has retired

from active duty

General Bliss was born at Chelsea, Massachusetts, He was graduated from Tufts May 17, 1888 College, Medford, Massachusetts, in 1910 with the degree of Doctor of Medicine, and was commissioned a first lieutenant in the Medical Reserve Corps in September, 1911 He served on active duty until May, 1913, when he was commissioned a first heu-He served on active duty until tenant in the Medical Corps of the Regular Army He was graduated from the Army Medical School,

Washington, DC, in June, 1913
After tours of duty at various stations in the United States and Hawan, he entered the Harvard Medical School for a special course in surgery from August to December, 1920 He remained at Boston for further clinical study and instruction at Harvard until September, 1921 In October of that year he was detailed to the Veteran's Bureau where he remained on duty in the Hospital Division until 1922

Subsequent to World War I, General Bliss served as Chief of Surgery at Sternberg General Hospital, Manila, Phillipine Islands, at Fort Sam Houston and at William Beaumont General Hospital, El Paso,

Texas He was a military observer in London from September, 1940 to January, 1941, and became Surgeon of the First Army and Eastern Defense Command in 1942 He was assigned as Chief of Operations in July, 1943 and Assistant Surgeon General, August, 1944, in the Office of The Surgeon General, Washington, D C, serving in that capacity until his appointment as Deputy Surgeon General in January, 1946 He was made Assistant to the Surgeon General with permanent grade of brigadier general in February,

General Bliss, who was awarded an honorary Doctor of Science degree by Tufts College in 1943, is a fellow of the American College of Surgeons During World War II he made extensive tours of the Pacific Areas, and later served as an observer at the Atom Bomb Test at Bikini General Bliss has recently returned to Washington from a two-month inspection trip through the European and Mediterranean areas

General Bliss has been awarded the Distinguished Service Medal, Legion of Merit, French Legion of Honor, and the Award of the Italian Crown

#### PENICILLIN POISONING IN A CASE OF ACUTE STAPHYLOCOCCUS AUREUS HEMOLYTICUS INFECTION OF A HIP JOINT

NELSON W CORNELL, M.D., New York City

(From the Surgical Service of the New York Hospital)

PREVIOUS to the report of this case before the Regional Fracture Committee in February 1916, there had been a paucity of reports in the liter ature of cases of penicillin poisoning penicillin was considered almost infallible in its administration for infection. It was felt that the report of such a case had considerable value for the profession in proving that there is actually some danger in penicillin therapy

#### Case Report

W K N Jr, a man, aged 17, was admitted to the Now York Hospital October 18 1944 with the following history Four days before admission he had played a game of football, after which he felt perfectly well The following morning the right leg felt stiff and painful in the upper thigh antemorly He also felt stiff and sore all over became more stiff and the patient had a constant cramplike pain in the upper right thigh anteriorly He was unable to walk for two days after the onset his appetite was poor and he had run a tempera ture of about 100 F He had had difficulty in uri nating one day before admission

Previous History —The patient had a fractured

skull at three years of age, the therapy of which involved an operation About one month previous to present admission he had a carbuncle on the right thigh which was slow in healing because of constant aggravation of the area from football practice

Examination on Admission.—His temperature was 99 F, pulse, 72, respiration, 24 blood pressure, 140/70 The right leg showed marked involuntary muscle spaam, with tenderness over the sartorius muscle near its origin Motion was markedly limited in all directions by pain in the groin Blood count was hemoglobin, 15 Gm., red blood count, 5 400 000 white blood count, 11 2, lymphocytes 24 monocytes, 7, mature, 51, bands, 16

The diagnosis lay between early infection of the

hip joint or acute poliomyclitis.
On October 10 1044 the day following admission, the leg was put in traction by means of a Buck s ex tension with the relief of pain. His temporature rose to 102 F \(^1\) rays of the hip joint (right) were heractive for any pathology White blood count was 116 Urine was negative. The second day after admission the patient became very ill His tem perature went to 106 6 F with rapid and shallow respiration Blood pressure was 160/60 The heart sounds were booming with a suspicion of short harsh systelle murmur, and it was thought this might be the beginning of an endocarditis. Neurologic ex-amination by Dr. Henry S. Dunning revealed no evidence of disease of the nervous system. Treat-ment at this time consisted of 20 000 units of pencillin given every four hours five times a day blood culture was taken

On the third day a plaster of Paris spica was applied to the patient's hip which lessened the pain. He was also put in an oxygen tent which

Read before the Regional Fracture Committee for New York and Brooklyn at New York on February 21 1948.

relieved his respirations and pulse somewhat. The hip joint was aspirated at this time and bloody fluid obtained showing Staphylococcus aurous hemolyticus The blood culture taken on the pre vious day showed the same organism in 2 per cent dextrose broth in forty-eight hours. The blood plate showed only one colony after five days. All subsequent blood cultures were negative

After five days of penicilin therapy the supply gave out and a different penicillin was used of which he was given 25 000 units every four hours six times a day The new pencellin preparation was begun in the morning of October 25 and that night the patient developed generalized urticaria which during the following day seemed almost confluent At 2 30 A.M on October 27 he com plained of numbress of the hands and the left foot. At 11 00 a.m. that day the observations on neurologic examination by Dr. Henry S. Dunning were as follows The patient complained of paralysis of the arms and left foot, numbers of the arms up to the shoulders and of the left foot, and tingling in all of the fingertips of both hands. The trunk entire left thigh and right leg were enclosed in a cast There was paralysis of the following muscles

Right

Flexors of neck	Moderate	Moderate
Elevators of shoul der	Moderate	Moderate
Pectoral	Moderate	Considerable
Abductors of arm	Considerable	Complete
Flexors of forcarm	Moderate	Considerable

foot		
Extensors of toes	Considerable	Complete
Flexors of toes	Considerable	Moderate
		1 41 . 1.64

All the deep reflexes of the arms and the left ankle jerk were absent. The knee jerk was active and the plantar reflex on the left. No stretch reflex of the fingers or toes was elicited. Sensation to cotton and pinprick was decreased on the dorsal aspect of the left foot and first four toes There was no ovidence of meningtis or disease of the central nervous system. It was Dr Dunning's opinion that the patient was suffering from polyneuritis caused by an allergic reaction to the penicillin preparation which was similar to that which has been observed to follow the use of various serums (F Young, J.A.M.A 98 1180 (April) 1932)

On the eleventh day after admission the director of penicillm therapy at the New York Hospital saw the patient after he had received no penicillin for twenty four hours. The urticaria had cleared the neuritis had not progressed and the patient s temperature was rising again He felt that the patient still had a staphylococcus infection, which was localized and should be treated with penicillin believed that the penicillin reaction had occurred as a sensitivity phenomena to one of the previous types used Experience with other sensitivity reactions to penicillin had indicated that it was not the antibactericidal agent common to all, but unidentified products in some which served as the antigen. Changing from one product to another usually had served to prevent further evidence of sensitivity Therefore, despite the dangers involved, a retrial of penicillin should be made by several doses of 1,000 units, and if no urticaria develops the dose should be increased to 25,000 units every two hours twelve times a day

Intracutaneous tests were made with a new penicillin and a negative result was obtained. The new

therapy was begun with no further reaction For purposes of complete immobilization, a fulllength cast had been applied on the seventh day after admission from the axilla to the toes on the right side, and extending down to the midthigh on the left On the fifteenth day after paralysis appeared, a supportive splint was applied to the left ankle At this time x-rays of the right hip showed marked marginal bone absorption, with characteristic demineralization of infection, on the bones of the

hip joint On November 7, 1944, nineteen days after admission, a second aspiration of the hip showed bloody fluid but no pus, with the culture showing the same organism. In view of this fact and because of a rise in the patient's temperature, one week later an exploration by operation of the hip joint was done. This revealed only bloody fluid and an irregular erosion of the cartilage of the head of the acetabulum Ten thousand units of penicillin were placed in the hip joint and a plaster of Paris spica reapplied X-rays at this time showed increased narrowing of the hip joint with destruction of the bone Pathologic report of the specimen taken at the operation showed only hyaline cartilage

The patient's condition improved rapidly after operation and on November 30, 1944, or forty-two days after admission, penicillin was discontinued On December 2, 1944, forty-four days after ad-mission, x-rays showed the destructive process becoming arrested The spica was removed, December 17, 1944, or the fifty-ninth day, and the patient was allowed up with crutches

He went home on December 24, 1944 At the

time of discharge there was satisfactory recovery of power in the arms and in the toes on the right, but there was complete paralysis of the dorsiflexor muscles of the foot and of the extensor muscles of the toes on the left

The patient progressed well, gained weight, and gradually discarded the crutches and began to walk He was readmitted to the hospital on January 27, 1945, with a milder recurrence, having a temperature of 103 F He was given penicillin, 37,500 units, every three hours, improvement was rapid, and he was discharged February 10, 1945, fourteen days after admission

He then quickly recovered and went to work in midsummer and walked with the aid of a cane, he became extremely active until November 7, 1945, when he was again readmitted with a recurrence of pain in the hip and a temperature of 100 2 F He was again given penicillin, and the leg was put in He was discharged in sixteen days able to walk At the last discharge, he still showed a left foot drop and hypoesthesia over the distribution of the left superficial peroneal nerve

#### Summary

A case is reported of Staphylococcus aureus hemolyticus infection of the right hip joint with bacteremia treated by penicillin over a period of forty days with apparent recovery At no time did suppuration take place and at operation only erosion of the cartilage and bloody fluid were found in the hip joint

Penicillin sensitivity to one product caused an alarming polyneuritis which has resulted in a prolonged and probably permanent foot drop on the left

side

Heroic penicillin therapy again was instituted in the face of this serious complication

The importance of immobilization of infected joints in addition to penicillin therapy was stressed, for this not only tends to cut down the severity of the infection but prevents bad deformities when ankylosis takes place

A joint was left with limited active and passive motion after a Staph aureus infection of the right

There was relighting of the infection with apparent lessened virulence each time, penicillin being used each time without further reaction

# FALSE POSITIVE TESTS FOR SY HILLS AFTER VACCINATION

The New York City Health Department Aills the attention of physicians to the possible of false positive serologic tests for syphilis vaccination. About 40 per cent of primary reaction in who develop vaccinia (primary reaction to the Halocinoid (secondary reaction) following vaccine the Halocinoid (secondary reaction) following vaccine the Halocinoid (secondary reaction) in the property against smallpox may be expected to give the privace of the property of doubtful reaction in one or more of the tests for syphilis

This reaction may appear from one to two Occasionally it apweeks after vaccination pears before seven days or between the fourteenth and twenty-first day Those individuals who show

an immune type of reaction will not give a positive test for syphilis

A positive serologic report does not preclude the assuance of a premarital certificate since the diagnosis of syphilis is a clinical and not a laboratory func-If the physician finds that his patient does not have syphilis in a communicable form, that individual may obtain a premarital certificate regardless of the laboratory report

Since a false positive rarely appears before the seventh day following vaccination, it would be advisable to obtain blood before or within five days

after vaccination

#### FAUCIAL DIPHTHERIA IN ADULTS WITH REFERENCE TO THE EARLY DIAGNOSIS

Report of a Case with Complete Heart Block

JOSEPH GOLDSTEIN MD, and PHILIP L CALCAGNO, MD, New York City

(From the Willard Parker Hospital for Contagious Diseases Department of Hospitals)

THE incidence of diphtheria cases in certain sec tions of the United States has increased in 1944 and, particularly, 1945 For the country as a whole the excess in reported cases over the median for the corresponding months of 1940 to 1944 has increased during 1945 until it amounted to 30 to 45 per cent for the last months of that year 1 A recent reviews indicated that this increase in diph thema is expected to continue because of the high prevalence of diphtheria among the Germans and the veteran forces of the United Nations.3 Many of the returning American troops from Europe are undoubtedly carriers of virulent diphtheria bacilli irrespective of whether or not they have had the diseasc.

At the Willard Parker Hospital the incidence of diphthema is higher at present than it has been for the past five years A number of adult patients with faucial diphthena have been observed in whom a diagnosis was not made until late in the disease. The fact that this disease was not even considered until late in the course of the illness would warrant additional emphasis on the development of diphtheria in the adult age groups as well as in children. Therefore the criteria which aid in making a presumptive diagnosis before laboratory confirmation, and a review of the reasons for misconceptions are enumerated.

A case of diphtheria with severe complications in an adult is presented because of its several unusual clinical features

#### Case Report

A 33-year-old white man was admitted to Williard Parker Hospital on January 6 1946 with the chief complaints of difficulty and pain on swallowing, and hoarseness for three days. For ten days before ad mission, the patient had a cold during which time he was ambulators There was a persistent nasal discharge and three days prior to admission some difficulty in swallowing.

Seven years previously he had been hospitalized for dropsy for six weeks. On discharge, he was informed that he had a kidney disease. He was rejected by the Army and Navy recruiting stations for having albumin in his urine. There was no his-

tory of hypertension or rheumatic fever Preliminary physical examination revealed a fairly well-developed but poorly nourished, acutely ill man His face and neck on the right side, down to the sternum, appeared swollen and the overlying skin was covered by a thin crythema. The swelling was rather firm and ligneous, very tender and homogeneous. No point of fluctuation was noted. No creptitations were palpable. A mass of organized tissue appeared to project from the oral pharynx. This mass extended forward over the soft palate and included half of the hard palate. The portion of tussue adjacent to the oral pharynx seemed to be attached to the right tonsil The surrounding tissues of the throat for only a short distance beyond the mass were a lurid red color The anterior edge of the mass was lying free in the mouth just above the tongue. The other atructures of the pharynx were difficult to differentiate. His temperature was 103 F, pulse 124, respiration 24 and blood pressure 145/100 The heart was not enlarged no murmurs were heard and there was a regular The lungs were clear throughout. mnus rhythm There were no significant findings in the abdomen. No abnormal neurologic findings were present the etiologic agent was thought to be Corynebacterlum diphtheriae 75 000 units of antitoxin were ad ministered intravenously and intramuscularly Thirty thousand units of penicillin were given every three hours intramuscularly for ten days to check

secondary invaders.

After initial therapy the patient improved slightly and was more alert. However he complained of pain in the throat continuously and had a great deal of difficulty in swallowing. There was a constant flow of mucus and blood from the corner of his mouth He took fluid very well. Three days after admission he coughed up a thick fibrous tissue The following day ectopic beats were heard upon auscultation of the heart. The local infection seemed to have improved. The swelling of the neck had subsided considerably On the seventh hospital day idioventricular rhythm was recorded and rates of 10 to 11 per minute were noted. This continued for approximately forty-eight hours and then rose to 20 to 30 No attacks of syncopy or gastrointestinal symptoms were observed dition became progressively werse on the ninth hospital day. The patient became anuric and ex pired on the next day

Laboratory Data—Examination of the blood showed a red cell count of 4,050,000 with 76 per cent hemoglobin, and a white cell count of 9 400 with 77 per cent polymorphonuclears. The differentiation tial count was normal. Repeated urine examination showed a specific gravity of 1 010 to 1 016 albumin, 2 plus to 4 plus, 15 to 20 white blood cells, 2 to 8 hyaline casts, and numerous red blood cells. The blood Wassermann test was negative. On the ninth hospital day, the nonprotein nitrogen was 115 mg per cent.

Cultures from the nose and throat taken on ad mission revealed only Staphylococcus aureus. However from all subsequent cultures C diphtheriae of a mitus type, and toxic for guinea pigs, was re-

covered

Pathologic Findings —The necropsy and pathologic examinations were done by Dr Vera B Dolgopol. The membrane coughed up on the fourth hospital day was thick, fibrous, and well-organised tissue. It measured 4 by 3 by 1 4 cm. Microscopic examination showed meshes and layers of fibrin with entangled red blood cells and fragments of nuclei of white blood cells.

At autopsy the heart weighed 510 Gm. The right ventricle was dilated the left ventricle was

hypertropined, and the muscle appeared flabby and friable Microscopic examination revealed a degenerative myocarditis, especially marked in the interventricular septum, extending to the fibers of the conductive system. The kidneys were enlarged, the right weighed 320 Gm and the left 330 Gm, the capsule was slightly adherent to the cortex, and the surface was granular. Microscopic examination revealed marked fibrosis in the vascular tufts. Many glomeruli were obliterated and one third of them showed multiple adhesions to the capsules. The tubules occasionally showed some granular and hyaline droplet degeneration.

#### Comment

This case presented several unusual features The bradycardia recorded on the ninth hospital day was 10 to 11 pulsations per minute lasted for only a short time, and on the following days the ventricular rate rose to 20 to 30 per minute Only one other reference to such a severe bradycardia could be found in the literature, that of Drs Denechau and Raffauet & However, their case presented convulsive crises and a picture of Adams-Stokes syndrome These were not features of the case herein reported. It is interesting to note that the day the bradycardia became evident coincided with the time that the patient became anuric the absence of extensive acute tubular changes in the kidney, this could be explained possibly on the basis of decreased cardiac output and, consequently, decreased renal blood flow, due to diphtheritic myocarditis

The type of membrane constitutes another remarkable feature of this case. When this patient was first observed, many different suggestions as to its nature and pathology were advanced. The membrane was thick, dense, very firm, and appeared as another tongue protruding from the soft palate. The appearance suggested a neoplastic lesion, a fungous infection, a lesion due to blood dyscrasia as much as or even more than it suggested the presence of a diphtheritic membrane.

However, the diagnosis of diphtheria was entertained because of the presence of the minimal area of hyperemia about the membrane, and by the fact that the membrane actually extended to areas beyond the tonsil—The manner of curling at the edges, the membrane remaining adherent over a tiny area, was indicative of a Klebs-Loeffler infection—The faded hemorrhagic spots present in this membrane were also a factor in helping to determine the nature of the disease

There are some points that aid in the clinical appraisal of a membranous lesion of the oropharynx that have not been heretofore suggested

- 1 A limited and fairly well-demarcated area of hyperemia about the membrane and an absence of extensive inflammatory reaction, especially early in the disease, is indicative of diphtheria
- 2 A membrane or exudate which seems to have extended since previous examinations is presumptive evidence of diphtheria
- 3 Diphtheria is a strong possibility if the exudate or membrane extends above the faucial pillars

- 4 When the uvula is involved in addition to the tonsillar areas, then diphtheritic infection is almost certain
- 5 Edema of the soft palate exists with only a small amount of surrounding inflammation when the lesion is due to C diphtheriae. In most cases due to pyogenic micro-organisms a distinct redness of the mucous membranes is noted. In neglecting this point, many diptheritic infections with edema of the surrounding tissues have been called peritonsillar abscesses. The hazard of such mistakes has been reviewed.

Other helpful and well-established factors are tone appearance, presence of albuminums in 30 to 40 per cent of severe cases, rapid, soft, compressible pulse out of proportion to the fever, and a rhinorrhea which may be blood-tinged

Some of the misconceptions that interfere with

correct diagnosis are here listed

1 The common belief that pain is not a prominent feature of diphtheria cannot be substantiated. In this case and many other adult patients, pain is cherted as a complaint, especially when edema of the soft parts is present. This becomes more evident when secondary invaders are present in sufficient numbers.

2 The idea that low temperatures are characteristic of diphtheritic infections sometimes can be misleading. In uncomplicated diphtheria, low temperatures do exist. However, whenever adenocellulitis or a mixed infection is present, elevated temperatures are common. Moreover, with this rise in temperature, the pulse-temperature ratio principle no longer holds true.

3 The characteristic musty odor usually associated with diphtheria is not always present Morgover, the characteristically described odor may be present in other necrotizing lesion of the pharynx.

4 Dr Drinkwater<sup>11</sup> has emphasized that the existence of only one patch occurring in each tonsillar, palatine, and uvular area is pathognomomic of C diphtheriae infection. However, this has not been the experience of observers at the Willard Parker Hospital and elsewhere, who have found several patches of diphtheritic infections beginning in these areas. Some diphtheritic infections beginning in the follicular crypts simulating follicular tonsillitis. It is interesting to note that these patients, on te-examination twenty-four to thirty-six hours later, may show coalescence of these follicles to give a membrane

At the risk of repetition, <sup>12-15</sup> it may be of value to emphasize that the preliminary cultures taken from the nose and throat have been shown frequently not to contain C diphtheriae. There have been various reasons given for this. In taking cultures, the physician often does not dig deeply enough under the membranes and only the surface is cultured. When rapid culture methods are used, experience in recognizing the early forms of diphtheritic micro-organisms is essential, as often these

forms may not be identified. Frequent cultural examinations are necessary and only after cultures taken at forty-eight-hour intervals are returned with perative reports is the patient considered nondiphtheric.

It is generally accepted that diphtheria can occur occasionally in Schick-negative patients 16 How ever it is also agreed that seven complications are unusual<sup>17</sup> in these patients. With this in mind we fail to understand why the armed forces do not require a Schick test upon all inducted This neg lect seems particularly regrettable since it is known that the Schick test will act as a booster dose to those previously inoculated 4 A 24-year-old Shick positive veteran who was admitted to Willard Parker Hospital one week after discharge from the Army with faucial diphtheria, died five weeks later with a severe myocarditis. In view of these facts it would seem advisable to have Shick tests done routinely on Army personnel

- An unusual case of faucial membranous diphtherla with extreme brady cardia 10 to 11 per min-
- ute, is presented. The criteria which may aid in making a pre-
- sumptive clinical diagnosis are discussed Attention was called to certain prevalent misconcuptions about diphtheria.

#### NOTE

Electrocardiographi examinations were made through the courtery of Dr Edward A Burkhardt

Laboratory examinations were carried out by Miss Naney Nemer and Miss Gladys Haber

Mrs Lillian Buxbaum gave invaluable help in formulating the paper

#### BREASTS AND BRASSIERES

Commercial interests, obsessed by sexual fetishism centering around the mammary glands are overemphasizing their product At the same time they are not responsible for the original emphasis on the breasts in our time, for that started with the tight Hollywood sweater inspired no doubt, by some crotic male. The sweater however was not good enough for the purpose since the breasts themselves were not usually sensational, so now the designers artists, exploiters of feshions, and manu facturers have given us a synthetic something that proclaims beguiningly to all bemused lechers 'Here I come don't look now

'Beguilingly' is the word, for these contraptions are intended to deceive the naive male. Beneath their phony opulence and aggression lie the undeveloped organs whose biologic destiny has been thwarted by our civilization, along with all the other deficiencies so evident in our many under

sexed women-pallid lips and roseless cheeks (under the lipstick, rouge, and kalsomine) frigidity, sterility dysmonorrhea, endometriosis, pelvic pa thology incident to the congestion that regularly accompanies inability to experience unfrustrated intercourse, dystocia, etc. Of course the baby seeking nourishment at the and breast might as well suckle the brassitre And so artificial feeding becomes logical enough in a civilization decadent at so many points.

Those charged with the writing of the trade s advertising blah are clever poets of the mammary school, we should call them

In fairness though we have to admit that our numerous woird sisters have their counterparts increasingly evident among the decadent males of the world, whose degeneracies have been accurately recorded by Conkin of Princeton University —

Medical Times May 1947

#### MASSIVE BILATERAL FIBROMAS OF THE OVARIES ASSOCIATED WITH ASCITES AND HYDROTHORAX MEIGS' SYNDROME

WILLIAM J FUSARO, M D, Brooklyn, New York

(From the Norwegian Hospital)

FIBROMA of the ovary associated with ascites and hydrothorax is a definite clinical syndrome The dramatic permanent disappearance of the chest and abdominal fluid following removal of the tumors has been demonstrated repeatedly in the for this condition to be kept in mind because of its resemblance to the picture of intra-abdominal malignancy with metastatic involvement of the Every effort for a correct diagnosis should be made, even to the extent of an exploratory laparotomy in an apparently doomed patient physical suffering from repeated chest and abdominal paracentesis, deep x-ray therapy, and other procedures can be avoided, not to mention the mental anxiety and torture not only to the patient but to the family as well

Meigs, although not the first to report this condition, has done more than anyone else to stimulate our interest and encourage correct diagnosis, directing our attention to the absolute surgical cure that can be accomplished by one of the simplest of

laparotomies

#### Case Report

A S, a 24-year-old white, single woman, was admitted to the Norwegian Hospital on August 17, 1943, with the chief complaint of pain in left lower quadrant and swelling of abdomen. History of present illness was that for several weeks the patient had experienced pain in the lower abdomen more marked on the left side and with a tendency to be-come worse at night — The pain was associated now and then with nausea, but no vomiting domen had become progressively larger and there was an increasing sensation of heaviness had no menstruction for the past two months There were no other associated symptoms history was noncontributory and family history was likewise negative Physical examination revealed a young, adult, white women in apparently no distress, having a temperature of 100 F, pulse, 110, respiration, 22, and blood pressure, 124/74 The chest revealed flatness in right base with distant to no breath sounds audible. The abdomen was moderately uniformly enlarged, especially below the umbilicus It was uniformly tense and a large resistant mass was palpable in both lower quadrants, extending into the left flank anteriorly. The left side was decidedly tender On percussion an area of dullness from the pubis, extending upward with an arch-like distribution, reaching the flanks laterally and the umbilicus in midline, was mapped A fluid wave was also elicited Impression on admission was ovarian cyst, fibroid uterus, ascites, and pleural effusion

An x-ray revealed fluid in the lower third of the est. This was tapped and 510 cc. of pale, strawcolored fluid, having a specific gravity of 1 025, and alkaline in reaction, was recovered. The cell count was infinite, the albumin, a heavy cloud. the smear was negative for organisms, bile, negative.

and culture, negative

The blood count revealed 4,200,000 red blood cells, with a hemoglobin of 85 per cent Sahli, a white blood count of 12,800, with 92 per cent polymorphonuclears, 7 per cent lymphocytes, and 1 per cent cosmophils Urinalysis was negative

Her general condition improved with rest in bed, the pain and abdominal discomfort being much However, fluid in the chest increased daily

following a tap on August 18 On August 20 it was decided we were dealing with a Meigs' syndrome, but operation was deferred because of cough and temperature The patient was given sulfadiazine and terpene hydrate August 25 an x-ray revealed the fluid level to have reached the level of the third rib anteriorly second tapping of the chest was done following v-ray, the fluid being of the same character as that previously recovered and in the amount of 550 cc

Breathing became easier for a few days, but temperature persisted between 99 F and 100 F. On August 29 after clinically observing an increase in the chest fluid again, although a temperature of 99 F to 100 F still persisted, an operation was decided upon The patient was prepared for operation and on August 30, under spinal anesthesia of 100 mg of novocaine and 15 mg of pontocaine, a laparotomy was performed and bilateral massive fibromas of the ovaries were removed. The right tumor filled the pelvis and extended up, occupying the right side of the abdomen as well. The left tumor was entirely outside of the pelvis and occupied the left side of the abdomen Peritoneal fluid was abundant, filling the entire cavity The uterus was normal. The tubes were markedly distorted but not the seat of any pathology Stomach, liver, intestines, and gallbladder were found free of pathology Palpation of retroperitoneum also was negative

Pathologic Report —Gross Examination specimen consists of two large oval masses of moderately firm tissue One measured 6 by 5 by 3 inches and weighed 4 pounds, the other measured 10 by 5 by 3 inches and weighed 5 pounds each there was an area of roughness where they were detached There were numerous rounded pronections on the surface On section, masses presented white and yellow tissue in cords and whorls There was one area which was softer and pinkish

in color, and appeared broken down

Microscopic Examination This revealed dense fibrous tissue, arranged in cords and whorls There were some areas of faintly staining fibroblasts There was a thick fibrous tissue capsule along one Some sections showed fibrous tissue of looser construction and there were areas that appeared to be areolar tissue with large cystic spaces were sections which showed ovarian tissue of dense construction, apparently in a compressed state

The pathologic diagnosis was bilateral fibromas of ovaries

The patient made an uneventful recovery from the operation. The wound healed by primary union and she was discharged September 10 1943, cloven days after operation On September 9 x ray of the chest revealed the fluid had dropped to the level of the fifth rib This gradually diminished until on October 22 1943 the fluid had entirely disappeared. She progressed favorably at home gaining weight, and tecling better all the time

However, on December 6 1913 aho began to notice a weakness of her legs which progressed within one week to actual paralysis. She was hospitalized on December 13, 1943, and x ray study revealed complete collapse of the body of the ninth dorsal vertebra and 50 per cent collapse of the body of the other than the body of the other than the body of the other than the pelvis and upper part of left femur. She was discharged in four days and fatal prognosis was given to the family

She expired a few weeks later at home During these several weeks I saw her frequently and at no time was I able to find signs of recurrence of fluid in the chest or abdomen The family was very much disturbed and refused not only autopay but further study for primary lesion at the time of second admission to the hospital.

#### Comment

My first thought was that the primary site of the metastasis might have been the ovaries and we missed the microscopic diagnosis. However repeated study of the sildes by the pathologist and other pathologists left us no diagnosis but simple

fibroma as far as the ovaries were concerned

The pathology apparently was so definite and the postoperative course so typical that I am certain the ovarian tumors had nothing to do with the

lesions in the bone She could have had a 'silent' malignancy elsewhere giving rise to the metastasss.

At operation there was no evidence of malignancy in the peritoneal cavity or retroperstoneal space. If the fluid in the chest had been of malignant origin It would not have disappeared following removal of the tumors, the way it did, never to return. The same holds true of the ascitle fluid. When the patient was tapped prior to operation on two occasions, the fluid rapidly recurred in a few days a fact peculiar in this syndrome, as compared to a slow recurrence of fluid in malignance.

I am thoroughly convinced this was a case of Meigs syndrome and that a silent malignancy was coexistent but played no part in the formation of the

peritoneal and pleural effusions

In a personal communication Dr Joe V Meigs stated that this seemed to be a case of true syndrome of fibroma of the ovary associated with fluid in the chest and fluid in the abdomen. He had not seen tumors of this size in his experience. It appeared from the description that they were simple fibromas with areas of pecrosis in them.

Where the metastasis came from was a very difficult question to answer Dr Meigs believed that she probably had a carcinoma of the breast or some other site. It could have been so small as to have been overlooked. It was possible that a lesion in the vertebra might have been missed but he thought that it was very unlikely that this tumor which is predominantly a fibronia, could metasta size in that way.

#### AVIATION MEDICINE COURSE ANNOUNCED

The recall of 20 Medical Corps Reserve officers annually for a period of ninety days, for the purpose of attending a course of instruction and training in Aviation Medicine, was recently announced by the War Department.

The course of instruction which is being presented under the technical supervision of the Air Burgeon at the AAF School of Aviation Medicine, Randolph Field, Texas covers a study of the fundamentals of Aviation Medicine with a special emphasis placed on the principles and practice of medicine as applied to aviation and the efficient performance of the <sup>16</sup>4 Physical Examination for Flying. Each graduate will receive a certificate designating him an Aviation Medical Examine.

Eligibility for the course requires the applicant to be under 40 years of age, meet minimum physical requirements for flying, and have an efficiency index

of 40 or above and not currently designated a Flight Surgeon or Aviation Modical Examiner. He must possess a real interest in avaition medicine and a desire to become an Aviation Medical Examiner. The physical examination may be obtained at most Army Air Force stations or an examination by any Flight Surgeon or Aviation Medical Examiner is acceptable.

The first class will begin October 6 and extend through December 12, 1947 Government quarters will be available at Randolph Field for students enrolled in the course Facilities will not permit

quarters for dependents.

Applications for this training should be made by letter accompanied by a copy of the WD AGO 69 Physical Examination for Flying to the Office of The Surgeon General, Attention Military Personnel Division by not later than August 16 1047

## LEPROSY TREATED WITH PENICILLIN

RAPHAEL LANDAU, M D, New York City

(From the Willard Parker Hospital, New York)

ALTHOUGH leprosy has been known since antiquity, up to the present no satisfactory treatment for the disease has been found. Various oral and parenteral remedies have been tried, such as chaulmoogra oil, gold salts, and diphtheria toxoid, without much effect. The drugs most recently tried are promin (a sulfonamide) and penicillin. Promin promotes healing of the nasal, laryngeal, and oral lesions, it is quite toxic, however, causing headaches, allergic rhinitis, acute leprous reaction, and hemolytic complications.

Penicillin was first tried in leprosy in 1945 by Faget and Pogge<sup>1</sup> in Carville, Louisana gave intramuscular injections of 50,000 to 300,000 units daily, over periods varying from four days to one month No beneficial effect was noted during the treatment or for six months thereafter reaction (chills, fever, nausea, erythema nodosum, and muscular pain) was observed in 1 patient who was treated during a subacute leprous reaction More favorable results were reported by Wharton<sup>2</sup> in British Guiana. In his report to the Board of Penicillin Control he states that, while penicillin does not exert a bactericidal or bacteriostatic action on the leprosy bacillus, it is of definite value in the complications of the disease, especially ulcerating nodules, lepra reaction, chronic ulcers, and inflammatory conditions of the eyes He concluded that the marked improvement in the physical and mental condition in far advanced cases would justify its use. His patients received a total of 100,000 to 400,000 units of the sodium salt of penicillin, given in 5,000 to 10,000 unit doses, every three hours intramuscularly

We wish to report a case of leprosy treated with penicilin at the Willard Parker Hospital. The treatment was started on a purely empiric basis before any reports on penicilin therapy for leprosy had appeared in the literature. The sodium salt of penicilin was not available at the time, and the patient was therefore treated with crude penicilin, prepared in the laboratory of Willard Parker Hospital. Later a small amount of penicilin X was obtained through the courtesy of Lederle Laboratories, Inc. Penicillin X was given for only four days.

### Case Report

The patient was a Puerto Rican man, 18 years old, who had been in the United States for six months Past history was noncontributory. There were no

cases of leprosy in the family

Physical Examination—The patient, when admitted to the Willard Parker Hospital, was a well-developed, well-nourished, light-skinned man—The temperature, pulse rate, and respirations were normal—The carlobes and the outer outlines of the cars were markedly enlarged, fleshy, nodular, and brownish in color, a small weeping cracked area was present on the upper lip—Pea-sized, nontender,

movable nodules were visible in chains on the outer surface of the arms, forcarms, and over the tibiac. Dark red, crusted areas of ulcerations, I to 2 cm in diameter, were present over both clows and the left forcarm, small pulpable nontender cervical, epitrochlear and inguinal nodes were present. No area of anesthesia could be found. The mucous membrane of the nose was covered with dried bloody crusts, but no perforation of the septum could be seen. The rest of the physical findings were normal

Laboratory Data — Smears from the nasal mucosa and scrapings of the crusts from both elbows were positive for acid-fast bacilli. Nasal smears remained positive throughout the course. The Wassermann reaction was four plus. Biopsics from several cutaneous lesions showed typical lesions of leprosy with numerous foam cells and acid-fast bacilli, best demonstrated in slides stained by the Fite method. Urine was normal. Blood count on October 26, 1944, was red blood cells, 4,900,000, 83 per cent hemoglobin. White blood count was 10,600, with 57 per cent neutrophils, 31 per cent lymphocytes, 4 per cent monocy tes, and 13 per cent eosinophils. Sedimentation rate fluctuated between 13 and 32 per hour. (Cutler method The high figure was obtained during an attack of situstis.) Stool examination revealed no over or parasites.

Therapy—The patient received 3,225,900 units of crude penicilin within six months 3,029,900 units were given intramuscularly, and 177,500 units were injected partly into the nodule of the left elbow and partly by infiltration into the surrounding subcutaneous tissue. When the infiltration route was used on the left forearm, a similar amount of the liquid medium<sup>3</sup> used for the production of the penicillin was injected as a control into two nodules on the right upper arm The local injections were discontinued after seven days because one of the crusted lesions over the left elbow showed superficial infection with hemolytic streptococcus Intramuscular administration was started on November 9. 1944, and was given for the following seven months The patient received (in a single injection) between 1,000 and 300,000 units of penicillin in the glutcal regions daily, except for short interruptions of treatment when penicillin was not available intravenous route was tried in addition to the intramuscular on December 21, 1944, 177,500 units were given in six hours. In addition a total of 337,000 units of penicillin X was given intramuscularly for four days

Course of the Disease—There was a slow subsidence of all nodules. The edema of the face, wrists, and ankles disappeared completely after nine weeks. The intravenous route was discontinued because of fever, but the intramuscular administration of crude penicillin was continued.

The percentage of cosmophils began to increase soon after beginning of the treatment, rising from 13 to 32 per cent within five weeks. The cosmophila declined, reaching the original figure of 13 per cent after five months of treatment. When pencillin was discontinued the percentage of cosmophils dropped to 5 per cent.

There was a degree of correlation between the

cosmophilia of the blood and local changes in the leprous lesions In twelve to thirty-six hours after a temporary rise in the percentage of cosinophils, the skin over the nodules were found to be flatter and softer than before and in five to six days the nod ules became either nonpalpable or markedly smaller The percentage of cosmophils tenually went down two or three points at that time

After four months of treatment all ulcors were Many old nodules in various parts of hoaled. the body disappeared all became flattened number of nodules were no longer palpable Vimble old nodules were still present on the back of the left hand, on the upper left arm, on the distal end of the left tible, anteriorly, and close to the Achilles tendon of the left leg. The larger nodules of the clows practically disappeared The lesion of the lip healed, the car lobes became flatter. All remaining nodules decreased in size and continued to decrease in size as noted upon physical examination four months after treatment was discontinued.

Biopsies -The histologic appearance of biopsies taken from the nodules before and during the treatment revealed typical leprous lesions, with add fast bacilli and foam cells present. Biopsy after treatment revealed the character of the lesions to be the same although the bacilli were less numerous and many of them were beaded. Some cosinophils were present around the lesions After nine months of treatment a fibroblastic reaction was seen in the upper levels of the corium near the granulomatous

legions.

#### Discussion

The patient showed a favorable chinical response to the treatment with crude penicillin. All ulcors healed, some nodules disappeared and a number of nodules became flat

It is difficult to state whether this was a specific

curative effect of penicillin or whether it was a nonspecific action as a result of inflammatory reanonse of leprous lesions to injections of a foreign substance. A slow but gradual improvement was observed after the reaction to each injection of penicilin When the reaction subsided, the cosmophils in the blood became less numerous suggests the possibility that the reaction was allergic in nature, with subsequent desensitization of the patient There was no appreciable change in the sedimentation rate during or after the treatment

#### Summary

A patient with leprosy was treated parenter ally over a period of six months with crude penicillin. Some clinical improvement with healing of ulcers and disappearance of nodules was noted after four The improvement followed months of treatment slight erythematous reaction of the skin over the nodules following each injection of penicillin

No general reactions were noted following intramuscular administration of crude penicillin. Intravenous injection produced a rise of tempera-

ture to 104 5 F

No significant changes in histologic structure of the persisting nodules were observed.

THE NEW YORK ACADEMY OF MEDICINE ANNOUNCES THE CREATION OF A SECTION ON MICROBIOLOGY

At a recent meeting of The New York Academy of Medicine the Fellowship of the Academy voted approval of the organization of a Section on Microbiology This action followed a request submitted to the Council of the Academy by a group of experts in the field of microbiology

This Section on Microbiology which is the twelfth of the Sections of the Academy has for its main objectives the encouragement of the exchange of information among microbiologists and the promotion of ready contacts between clinical and laboratory in-

vestigators The Fellowship of the Section will be broad, and will include not only those who have a direct interest in microbiology but also those who deal with microbiology in their primary functions as clinicians or scientists in other branches.

The officers of the newly organized Section are chairman, Gregory Shwarisman, M.D. secretary Hurry Most, M.D. advisory committee, Road J Dubos, M.D. Frank I. Horsfall Jr., M.D. Colin M. MacLeod, M.D., Raiph S. Muckenfuss, M.D., and John G. Kidd, M.D.

# DEPARTMENT OF MEDICAL CARE INSURANCE

CONDUCTED BY GEORGE P FARRELL, DIRECTOR

## Progress of New York State Voluntary Nonprofit Medical Care Plans

(Approved by the Medical Society of the State of New York)

THE graph below illustrates the steady and phenomenal growth of New York State medical care plans from 1940 to December 31, 1946 During 1946 membership (subscriber and dependents) in the six voluntary medical care plans increased by 329-794, making a total membership of 598,042, or an increase of 122 per

75,000

25,000

15,000

5,000

cent as of December 600,000 31, 1946 The continued increase in enrollment since January 1, 1947, of 177,000 new 300,000 members is a definite indication of the acceptance by the public 150,000 of benefits offered by the plans Enrollment as of May 31, 1947, totaled 775,000 members

During 1946 physicians submitted over 95,000 claims on behalf of members, in ex-\$2,000,000 cess of This represents benefits to members equivalent to one million office calls at \$200, twenty thousand appendectomies at \$100, or fifty thousand tonsillectomies at \$40

Two new plans were organized in 1946 The GeneseeValley Medical

Care, Inc , Rochester, New York, offering a surgical indemnity contract, and the Northeastern New York Medical Service, Inc , Albany, offering a surgical and inhospital medical service contract to individual members with incomes less than \$2,000 annually. and the family subscriber whose income does not exceed \$3,500 annually

In 1946 all plans agreed to accept a member by transfer from another plan and allow credits accrued under the original contract for waiting periods toward all limitations under new contract to

Subscribers may apply for any type of be issued contract currently offered and the plan will accept a subscriber from an out-of-state plan which recipro-Waiting periods for maternity benefits will be credited from date of original contract on transferred members, provided the original contract

\$2,000,000

\$1,000,000

250,000

offered this service The Genesce Valley Medical Care plan reserves the right to reject or make an exception for any physical condition which existed at the time of enroll-\$ 500,000 ment in the original plan This agreement among nonprofit volun tary plans in the State is a definite advantage to its 775,000 members in having the guarantee of continued membership and protection without penalties

> Due to the successful record of United 10,000 Medical Service, New York City, effective January 1, 1947, benefits were increased substantially in the surgical contract allowances and service benefits provided for all indemnity contract holdsubscription rates

\$ 150,000 100,000 1945 - BENEFITS TO MEMBERS ers at no increase in

It is anticipated that membership will increase to one million and benefits exceed three and a half million dollars during 1947, with all plans in full operation

With over 16,000 participating physicians this objective can be accomplished by their continued cooperation in acquainting patients with the benefits provided under the plans to the mutual advantage of physician and patient

#### HISTORY OF FOODS

It was Queen Elizabeth who started the custom of eating three meals a day in the British Isles Prior to her reign, the Englishman was satisfied with only two -Food and Nutration, April, 1947

## NECROLOGY

Oscar L Baumann, M D, 59, of New York City died on May 17 He received his medical degree in 1910 from the College of Physicians and Surgeons, Columbia University Dr Baumann was a member of the State and County medical societies, and

the American Medical Association.

Gertrude Behrens, M.D., of New York City, died on May 20 She was a graduate of the Uni versity of Kiel, Germany, in the class of 1919 She was attending physician of the obstetrical department of the New York Infirmary for Women and Children New York City and visiting clinical assistant of the Bellovue Pediatric Department, Bellevue Hospital. Dr Behrens was a number of the State and County medical societies, American Medical Association and the Women's Medical Society She was 53 years of age at the time of her death.

J Bayard Clark, M.D , 73 of New York City died on May 20 He was formerly professor of urology at New York Polyclinic Medical School and a genitourinary surgeon for many years in various city

hospitals.

Dr Clark received his medical degree in 1898 from the College of Physicians and Surgeons Columbia University He was a member of the American Association of Genito-Urinary Surgeons the American Urological Society, the International Surgical Society the New York Academy of Medi-cine the American Medical Association, and the

State and County medical societies

Harold Sparrow Dorrance, M D , 55 of Rochester died on May 21 He received his medical degree in 1920 from the Harvard Medical School He was senior attending physician to Highland Hospital of Rochester Dr Dorrance was a member of the American Medical Association, and the State and County medical societies.

Country medical societies.

Clile Hirschfield, M.D., 60 of New York City died on May 26 She was graduated from the College of Physicians and Surgeons in Boston, Massachusetts, in 1901. She was a member of the Amarican Medical Association and the State and Country.

County medical societies

Frank B Keleher, M.D 73, of Brooklyn, died on April 18. Dr Keleher was assistant pediatri cian at St. Mary's Hospital, Brooklyn. He was graduated from Long Island College of Medicine in 1895 and was a former member of the Kinga County Medical Society the Brooklyn Medical Society and the Catholic Physicians Gulld

Harold C Lyman, M D, of Utics, medical di rector of Memorial Hospital for twenty-three years and a director of the State Society of Industrial Medicine died on May 20 His ago was 54 He received his medical degree in 1917 from the New

York Medical College Flower and Fifth Avenue Hospitals He was a member of the American Institute of Homeopathy and the State Homeo-

Pathic Society
Charles J Mengis, M.D., 72 of Buffalo died
April 27 He was graduated from Niagara Univer sity Medical School in 1890 Dr Mengis was attending physician at the Shelter Home of the Erle County Welfare Department for about five years and resigned in 1940 He was a member of the Buffalo Academy of Medicine, the American

Medical Association, and a former member of the Eric County Medical Society Francis Mulcare, M.D., of Schenectady died on April 18 1946 He was graduated from the Albany Medical College in 1924 Dr. Mulcare was a mem ber of the American Medical Association, and the State and County medical societies At the time

of his death he was 49 years old.

Albert Grove Odell, M.D., of Clifton Springs, a member of the Clifton Springs Sanatorium staff for thirty four years died on May 19 Dr Odell was graduated from Syracuse University College of Medicine, in 1904 and was a member of the Ameri can Psychiatric Society the American Association for the Study of Montal Deficiency, the American Medical Association, and the State and County medical societies He was consulting psychiatrist at the Newark (New York) State School Dr Odell was 69 at the time of his death.

Albert A. Ripperger, M D, 85 of New York City died on May 21 He studied medicine at the Uni-versity of Munich and received his degree in 1893 Dr. Ripperger was associated with the German Hospital and Dispensary New York City which is now the Lenox Hill Hospital where he developed the Ripperger shield a lead apron to protect opera-

tors from x ray burns

Charles Edward Scofield M.D., of Brooklyn died on May 18 at the age of 70 Dr Scofield was president of the Kings County Medical Society in 1923, and was senior surgeon of the Brooklyn Lye and Car Hospital and an attending specialist to St Glies Hospital. He received his medical degree in 1890 from the College of Physicians and Surgeons Columbia University He was a member of the American College of Surgeons the American Medical Association, and the State and County medical societies

Joseph Yale Spinuxza, M.D., 48 of Buffalo died on April 21 He was graduated in 1925 from the University of Buffalo School of Medicine, and was assistant surgeon at Lafayette General Hospi tal, Buffalo He was a member of the American Medical Association, and the State and County

medical societies.

#### ENGLISH PHYSICIAN RECEIVES GASTROENTEROLOGY AWARD

The National Gastroenterological Association has announced that First Prize in its 1947 Prize Award Contest for the best unpublished contribution on gastroenterology or an allied subject has been awarded to Dr Frederic Duran-Jorda, of Manchester, England.

Dr Duran-Jorda s paper on Histo-Pathology of the Semi-Squamous Epithelial Layer as Found in the Colon was selected by the judges from among twelve entries received from all parts of the world.

The check for \$100 representing the first prize and a Certificate of Merit were awarded at the Annual

Banquet in Atlantic City, N J on June 5
Certificates of Merit also were awarded to Dra
William Nimeh, of Mesneo City D F, August
Schrumpf and Trygro Kahrs, of Porsgrunn, Norway
W\_Paolino and G Boccussi, of Turin, Italy

The winning paper as well as those receiving Cer tificates of Merit will be published in the Review of

Gastroenterology

## WOMAN'S AUXILIARY

## TO THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

Officers of Standing Committees Appointed for 1947-1948

CHAIRMEN of standing committees for 1947-1948 for the Woman's Auxiliary to the Medical Society of the State of New York have been appointed by Mrs Harry F Pohlmann, president

They are finance committee, Mrs Bradford F Golly, of Rome, convention, Mrs Clifton L Dance, of Brooklyn, press and publicity, Mrs Lee R Sanborn, of Angola, national bulletin, Mrs William J Godfrey, of Flushing, legislation, Mrs Alfred S Grussner, of Schenectady, Physicians' Home, Mrs

George P Bergman, of Mattituck, Long Island historian, Mrs Arthur F Holding, of Albany, archives, Mrs Thomas M D'Angelo, of Flushing, organization, Mrs Herman W Galster, of Scotia, printing and supplies, Mrs Hugh G Henry, of Germantown, public relations, Mrs Walter G Hayward, of Jamestown, parliamentarian, Mrs Gerald C Cooney of Syracuse, program, Mrs August Fincke, of Garden City, and Hygeia, Mrs Joseph Elia, of Niagara Falls

## County News

Erie County The monthly luncheon meeting of the Woman's Auxiliary to the Erie County Medical Society was held May 27 at the Hotel Statler in Buffalo Thomas Cook Brown, chief editorial writer of the Buffalo Courier-Express, spoke on "The United Nations" Reports on the State Auxiliary Convention were given by Mrs Ralph Upson, president-elect and chairman of delegates for Erie County

The Auxiliary voted to increase the amount of their Voluntary Loan Scholarship Fund for student nurses and to offer two full scholarships this year Hostesses for the meeting were Mrs J W, Bayliss, Mrs Thomas G Allen, Mrs Joseph S Tunnel, Mrs Fred G Carl, and Mrs Harold G Reist

Saratoga County A luncheon meeting of the Woman's Auxiliary to the Saratoga County Medical Society was held June 3 in the Schuyler House, Mechanicville A report on the State Auxiliary Convention, held in Buffalo in May, was given by Mrs Thomas E Bullard, first vice-president of the State Auxiliary A donation was made for the Cancer Fund

## **ANNOUNCEMENT**

THE UNIVERSITY OF THE STATE OF NEW YORK THE STATE EDUCATIONAL DEPARTMENT BOARD OF MEDICAL EXAMINERS

Dr W P Anderton, Secretary Medical Society of the State of New York 292 Madison. Avenue New York 17, N Y Dear Dr Anderton

This is to certify that the Board of Regents at a meeting held April 18, 1947,

VOTED, That the determination of the medical Committee on Grievances in the matter of the application for the revocation of the medical license heretofore granted to Carl Joseph Sachs, Brooklyn, be accepted and sustained, that, in compliance with the recommendation of said committee, said Carl Joseph Sachs be censured and reprimanded, that said Carl Joseph Sachs be ordered to appear for such censure and reprimand before the Board of Regents at a time and

place to be determined by the Commissioner of Education, notice of which shall be given to said Carl Joseph Sachs by said Commissioner, and that the Commissioner of Education be empowered and directed to execute, for and on behalf of the Board of Regents, all orders necessary to carry out the terms of this vote

Dr Carl Joseph Sachs is registered for the year 1947 to 1948 from 1138 Eastern Parkway, Brooklyn, New York. The order was served on Dr Sachs on May 1, 1947

Sincerely yours,

(Signed) JACOB L LOCHNER, JR, MD, Secretary NY State Board of Medical Examiners

May 13, 1947

#### REVIEWED

X-Rays and Radium in the Treatment of Diseases of The Skin By George M MacKee, MD, and Anthony C Cipollaro, MD Contributor, Hamilton Montgomery, MD Fourth edition Octavo of 668 pages, illustrated Philadelphia, Lea & Febiger, 1946 Cloth, \$10

This is a fourth edition of a textbook whose popularity has never waned since its first appearance. Conceived and written by one of the foremost teachers in his profession, Doctor McKee speaks with authority on a subject in which his vast knowledge and experience has brought him

pre-eminence

To the dermatologist and those technicians concerned with the use of  $\lambda$ -rays and radium in the treatment of skin diseases, this treatise is the authoritative guide and handy reference. In its pages one finds the proper technic for the treatment of every important dermatologic disease in which radiation is of service.

NATHAN THOMAS BEERS

The Medical Clinics of North America January, 1945 (Chicago Number) Illustrated Philadelphia, W B Saunders Company, 1945 Published Bimonthly (six numbers a year) Cloth, \$16 net, Paper, \$12 net

This book is primarily a neurologic climic, with the exception of the last four chapters, but in its eighteen chapters by separate contributors it covers many of the up-to-the minute problems in this specialty. Moreover, the authors display excellent clinical material in clear form. The book is an interesting example of how much territory is covered in this medical clinic series. They make a fine reference system for the specialist, as well as the practitioner.

SAM PARKER

Narco-analysis A New Technique in Short-Cut Psychotherapy A Comparison with Other Methods and Notes on the Barbiturates By J Stephen Horsley Duodecimo of 134 pages, illustrated New York, Oxford University Press, first American edition 1946 Cloth, \$2 50

This small volume on Narco-Analysis is written by the man who first devised and named this psychotherapeutic technic. The greatest ment of this book lies in the fair and frank exposition by the author of what this technic can and cannot do. No exaggerated claims are made for it nor does he regard it as an infallible substitute for any other psychotherapeutic procedure. Neither does he regard it theoretically as something apart from the perceptions and principles underlying all psychotherapy. The author's nich clinical experience in the use of Narco-Analysis for psychologic research as well as for therapy, gives the reader ample opportunity to familiarize himself with its use. The book is well written and should be read by those interested in the subject.

SIMON ROTHENBERG

A Primer for Diabetic Patients By Russell M Wilder, M D Eighth edition Sevtodecimo of 192 pages, illustrated Philadelphia, W B Saunders Company, 1946 Cloth, \$1.75

This little volume is packed with important information for both physicians and diabetic patients. The style is unurually readable. The tricks of diet and dietary equivalents comprise the main problems facing most diabetics in their attempt to live socially acceptable lives. The dietetic sections of the book will prove an invaluable adjunct to both physician and patient in the achievement of their mutual goal—the patient's well-being.

It is debatable whether the sections addressed to the physician should be included in such a Primer, but since they are, it should be pointed out that the recommendations for fluid treatment of dehydration and shock are too conservative, and that blood should be used earlier and much more freely than advocated over half the patients with diabetic come die of shock without other cause of death

The Primer is recommended very highly for

practical life-regulation by diabetics

MAURICE TULIN

The Chest A Handbook of Roentgen Diagnosis By Leo G Rigler, M D Octavo of 352 pages, illustrated Chicago, Year Book Publishers, 1946 Cloth, \$6 50

This represents one of a series of handbooks dealing with the roentgen diagnosis of the various systems of the body. It is presented as an atlas and, as such, it is quite complete as it relates to the pathology of the pulmonary system and pleurn. The volume will, undoubtedly, find its appeal among those, other than roentgenologists, who are interested in the diagnosis of pulmonary conditions, it is unfortunate that the author, while describing the methods of examination, did not see fit to stress the dangers of fluoroscopy and radiography

RICHARD A RENDICH

The Human Ear in Anatomical Transparencies Descriptive text by Stephen L Polyak, MD, anatomic transparencies and illustrations by Gladys McHugh, and anatomic preparations by Delbert K. Judd, MD Quarto of 136 pages, illustrated Elmsford, NY, Sonotone Corp, 1946 Cloth, \$10.50

The format of this book is that of an atlas. The drawings are from actual specimens and are reproduced on transparencies which are so arranged that they are superimposed one upon the other representing serial sections. The text is well prepared and includes the embryology as well as the anatomy and physiology of the auditory mechanism. Included in the volume, too, is a discussion of the anatomy and physiology of the vocal mechanism.

SAMUEL ZWERLING

# for the nervous patient with poor appetite

a delightfully ESKAPHEN B ELIXIR palatable combination of phenobarbital (dose) has been developed and thiamine for the many tense and nervous patients, especially women, whose most characteristic symptoms are agitation, wakefulness and poor appetite. For these patients suffering more often than not from thiamine deficiency ESKAPHEN B provides, in a pharmaceutically excellent preparation, both the calming action of phenobarbital and the tone restoring effect of Vitamin Bi

Doctors, Drugs and Steel By Edward Podolsky, MDOctavo of 384 pages, illustrated York, Bernard Ackerman, 1946 Cloth, \$3 75

Dr Podolsky endeavors to tell something of what modern medicine does to banish disease and to pro-It is an ambitious saga of medicine, obviously dedicated to the lay reader but with a considerable appeal to doctors themselves Most of the descriptions are factual with some emphasis on the spectacular, as is evidenced by some chapter heads, Architects in Bone, New Life on Borrowed Organs, and Menders of the Maimed This seems to cover the field of modern medicine, a record of the many triumphs of clinicians and investigators Many of the procedures described are concededly experimental but are included because of the possibility of future significance and application

JOSEPH RAPHAEL

Mongolism and Cretnism. A Study of the Clinical Manifestations and the General Pathology of Pituitary and Thyroid Deficiency By Clemens E Benda, M D Octavo of 310 pages, illustrated New York, Grune & Stratton, 1946 Cloth, \$6 50 By Clemens

This book is well written. Benda, a neuropsychiatrist, has a scientific approach toward the

solution of the etiology of mongolism

An excellent description of the plica marginilas, with pictures showing the eye signs, is an indication of his lucid, painstaking, scholarly work that Benda goes too far in calling these individuals pituitary cretins, although the future may show that he is correct. The determination of prolans and estrogens is not given. We wonder why only one case of "cure" is reported following the use of the "thyrotropic hormone"

This book is enthusiastically recommended to anyone who is interested in endocrinology or mon-

golism, because of its excellence

BERNARD SELIGMAN

Psychotherapy in General Medicine Report of an Experimental Postgraduate Course Bv Geddes

Smith Octavo of 38 pages New York, Commonwealth Fund, 1946 Paper, 25c.

This pamphlet reports the experiences with a practical course in psychotherapy for general practitioners The difficulties as well as the benefits derived are discussed in detail Since the reactions of the student physicians are given, it would be profitable for individuals who are giving or contemplate taking such a course to study this booklet

ARTHUR J LAPOVSKY

Sex Problems of the Returned Veteran By Howard Kitching, M D Duodecimo of 124 pages New York, Emerson Books, 1946 Cloth, \$1 50

Dr Kitching's remarks are clearly written and cover in idealistic fashion and without evident condescension the problems of normal individuals facing the prospect of reunion and the months of readjustment afterward He describes sexual readjustment in an isolated sense, not relating it to the other problems of adjustments, economic and occupational, which are simultaneously encountered

The book is written for the laity and as such may have educational value It is not likely to give new insight to psychiatrists who are dealing with the

problems of the more seriously conflicted

EDWARD F FALSEY

Practical Malariology Prepared Under the Auspices of the Division of Medical Sciences of the Mational Research Council. By Paul F Russell, M D, Luther S West, Ph D, and Regunald D Man-well, Sc D Octavo of 684 pages, illustrated Philadelphia, W B Saunders Company, 1946 Cloth, \$8 00

The problem of malaria is one that concerns every section of the country today for there is hardly a village that has not had its citizens exposed to the danger while serving in the armed This volume offers a rather complete and descriptive treatise on malaria of interest to the general practitioner, the student, and the specialist

It emphasizes especially the importance of prophylaus and control—(1) by the administration of drugs, (2) larvicides, (3) drainage and filling, (4) control of adult mosquitoes, (5) control of man

The authors are especially qualified by their training and experience to make available in this monograph all reliable information gained to date in the fight against malaria

HENRY M FEINBLATT

Allergy in Practice By Samuel M Feinberg, M D, with the collaboration of Oren C Durham, and Carl A Dragstedt, M D Second edition Octavo of 838 pages, illustrated Chicago, Year Book Publishers, 1946 Cloth, \$10 50

This is the second edition of an excellent work covering the entire field of allergy Asthma and hay fever are exhaustively presented The chapters on pollens, pollen allergy, allergy to fungi, and treatment have been brought up to date view of the status of histamine and histamine antagonists in allergy provides a clear discussion of this timely subject

This volume can be heartily recommended to both the allergist and the general practitioner

MAX HARTEN

The Management of Obesity A Handbook for the General Practitioner By Louis Pelner, M D Octavo of 144 pages, illustrated New York, Personal Diet Service, 1946 Cloth, \$3 00

The author has prepared a satisfactory review of the subject for general practitioners. The principles are sensible and practical There are several case illustrations and a variety of food charts, diet lists, and low caloric menus

The presentation is almost entirely clinical with minimal reference to the chemical and physiologic disturbances in obesity Exception may be taken to the use of mercurial diuretics to remove fluid retained during menstrual periods of some obese women

The book is recommended

DUNCAN W CLARK

Principles of Hematology By Russell L Haden. Octavo of 366 pages, illus-MDThird edition Philadelphia, Lea, & Febiger, 1946 trated \$5 OO

This work is good because the style is clear, the diagrams are simple, and the case histories are in-With the newer knowledge gleaned from sternal puncture and splenic puncture, too much stress is laid upon the calculation of indices The latter are becoming less and less important since the advent of specific information obtained from bone marrow and splenic aspiration biopsies Still, for a concise knowledge of practical hematology, no one can afford to be without this book

## WHAT DOES THE MEDICAL SOCIETY OF THE STATE OF NEW YORK DO FOR ITS MEMBERS?

#### Workmen's Compensation Bureau

The benefits accruing to a member of the State and County Medical Society because of the existence and activities of the Workmen's Compensation Bureau are as follows

The State Medical Society, through its representation on Governor Lehman's Commission to revise the Workmen's Compensation Law in 1933, was originally responsible for the free-choice principle written into the Workmen's Compensation Law in 1935 by which an injured worker is entitled to select the physician of his choice for treatment

For the first time since the State Medical Society, years ago, relinquished the right to license physicians to practice medicine, the county medical societies were clothed with definite responsibilities of a professional and procedural nature. These included the qualifying and recommending of physicians for authorization to practice under the Workmen's Compensation Law, either as general practitioners, or specialists. The medical societies were clothed with authority to participate in the arbitration of disputed medical bills. Before 1935, all medical bills were fixed by the Industrial Commissioner through a medical bill calendar while, thereafter, the fees were paid in accordance with a fee schedule recommended by the president of the State Medical Society

Disputed bills were arbitrated by physicians Violations of the provisions of the Workmen's Compensation Law were placed under the jurisdiction in the first instance of the Workmen's Compensation Committees set up in each county of the State by the county medical societies. The disciplining of the physician was placed in the hands of the medical societies in the first instance, with provisions for appeal to the Industrial Council which also numbered among its members physicians recommended by the Medical Societies. The local county society compensation committees were authorized to recommend the establishment of physicians and employers medical bureaus, provisions for which were made in the law could be licensed without the inspection and approval of physicians familiar with local conditions. They, too, recommended impartial medical experts to decide difficult medical problems before the Compensation

referees

In addition to these functions, the creation of a State Medical Society compensation bureau, with a full-time director, afforded a means of integrating the work of the local county society compensation committees, which made for uniformity of practice throughout the State in relation to the administration of the Workmen's Compensation Law as it devolved upon the organized profession The entire machinery of qualifying physicians and changing their ratings from time to time in accordance with the changes in their qualifica-tions and practice was set up by the State Medical Society through its bureau and followed by the 61 county medical societies The Workmen's Compensation Bureau serves as a means of approach by physicians and county societies to the Department of Labor, to the more than 70 insurance carriers and numerous selfinsured employers and municipalities throughout the State in all matters pertaining to workmen's compensation procedures

The Bureau has been at the service of the profession for the collection of medical bills, and for the protection of the physician's rights in all compensation matters involving, not only the law, but the rules and regulations set up for its administration. Not only has the Bureau collected hundreds of thousands of dollars of disputed and unpaid medical bills, but it has interceded with the Department of Labor in facilitating the determination of liability so that medical bills in dispute and waiting payment could be paid. The Workmen's Compensation Bureau has independently, and in connection with the county medical societies, kept physicians informed of all pending workmen's compensation legislation, acquainted them with the provisions of amendments to the law, and represented them when necessary before the Department of Labor,

the Industrial Council, and other bodies

Numerous talks, lectures, round-table discussions, and other programs before county medical societies on the professional and administrative aspects of the Workmen's Compensation Law have been carried out in the course of the last ten years The Bureau has set up examining committees in roentgenology, and supervised the creation of other examining committees to determine the qualification of physicians where

the usual methods of reviewing qualifications were not adequate

There has been created a Joint Council, the members of which represent the various stock and mutual insurance carriers, the State Medical Society, and the State Osteopathic Society, for the discussion and clarification of workmen's compensation administrative matters, fees, and other procedures incidental to the treatment of patients and the carrying out of the law and rules and regulations governing same. There has also been created local committees in the large counties with joint representation to iron out disputes and foster good will, and to oil the machinery of workmen's compensation administration in the interest of good medical care to injured workers

The Bureau is in receipt of hundreds of letters of appreciation from physicians throughout the State testifying to the value of the services rendered them by this Bureau and, it goes without saying, similar service was rendered by many of the local county society compensation committees

The Workmen's Compensation fee schedule has brought into the pockets of physicians of this State, annually, from fifteen to thirty million dollars since 1935, the latter figure being more nearly correct for the period of great industrial activity incidental to the war

The above is just a sketch of the benefits that have accrued to a member of the State Medical Society The above services were rendered by the State Medical Society Compensation Bureau without additional

cost to the individual physician, and at considerable expense to the State Society

In certain of the larger county medical societies, a small annual or initial fee is charged for the maintenance of the local compensation committee but in no instance has this fee been fully adequate to support the work In most instances, the payment of this fee has been voluntary and not obligatory. No extra fee was ever charged by the State Medical Society for the service of its Workmen's Compensation Bureau in any or all workmen's compensation matters

## OTHER NATIONS TO STUDY AMERICAN BLOOD PROGRAM

Scholarships for the study of blood and its derivatives have been offered to a selected group of pressional candidates from foreign countries by the American Red Cross in cooperation with the League of Red Cross Societies These candidates will be proposed by the national Red Cross societies and will be selected on a basis of personal and professional gualifications as well as on the need in their country for information on the use of blood fractions. The scholarships will be for 9 to 12 months of study in the United States and will have a value of \$2.500–3000

The training will include study of methods of collecting and processing blood, processing plasma to the products of plasma fractionation, and the uses of blood and blood derivatives in medicine and public health. Methods of recruiting donors and plans for organization will also be studied. Field work will be done in such varied parts of the country as North Dakota for mobile field laboratory operation, Michigan for its state plan of plasma fractionation and in Miami, Florite plan of plasma fractionation and in

#### TOMPKINS SUPERVISORS APPOINT COUNTY BOARD OF HEALTH

Proceeding with the organization of the new county health district, the Tompkins County Board of Supervisors recently appointed a County Board of Health as required by Section 20-b, Article III, of the Public Health Law The members are Mr Paul S Livermore, representing the City of Ithaca, Mr Harvey Stevenson, Enfield, representing the County Board of Supervisors, and Dr Norman S Moore, Mr James E Rice, Jr, Mr Harry N Gordon, Dr Willard R Short, Dr Henry B Sutton, and Miss Eugenia Van Cleef, members-at-large The county supervisors have also taken steps to fill the position of County Commissioner of Health and to procure other essential personnel

This action follows formal approval by the State Commissioner of Health of a resolution passed vy the Tompkins County officials proposing the establishment of a county health district By resolution passed by the Mayor and the Common Council, the City of Ithaca will become an integral part of the

district

In organizing its public health services on a county health district basis, Tompkins County may receive state aid and under the terms of a law which became effective January 1 of the current year and which provides that the State may reimburse a county annually for 75 per cent of the first \$100,000 ex-pended for public health work and for 50 per cent of expenditures in excess of \$100,000 Rensselaer, Schoharie, and Ulster have already taken advantage of the new law

Counties which adopted the county health district form of organization prior to the revision of the state aid law are Cattaraugus, Cortland, Columbia, West-chester, Nassau, and Suffolk Effective January 1, 1947, these counties will also receive state aid under the revised law on the same basis as newly organized county health departments -Health News, May 19,

# Are "ills of the spirit"ever subject to somatic therapy?

As every experienced doctor knows, there are times when psychoneurotic symptoms are directly traceable to un suspected states of physical dysfunction or maladjustment. One of the most frequent of these is the entering phase of the menopause cycle.

Modern Conestron oral therapy almost invariably overcomes estrogenic maladjustment, restores a feeling of well being, tides a woman through the physical adjustment period with a minimum of physical distress or emotional unbalance

# Gonestron

# On the Plus Values In Variety Meats

Variety meats—as the meat industry terms liver, kidney, heart, thymus (sweetbreads), and tongue—are at least as nutritionally desirable as muscle meat. In fact, in some respects certain organ meats are superior

They provide the indispensable amino acids in the same advantageous complete assortment as muscle meat. Hence their protein is of the same high biologic value, capable of meeting every protein need of the organism Quantitatively their protein content is approximately equal to that of muscle meat.

For hemoglobin synthesis, liver and kidney have been found superior not only to all other protein sources so far studied but also to muscle meat itself

All organ meats are good sources of the B-complex vitamins Some of them, such as liver and kidney, are especially rich in macin. Liver is also an excellent source of vitamin A.

Apparently the vital role these organs play in the functioning of the animal body is reflected in the valuable contribution they can make to human nutrition. Their frequent inclusion in the human dietary—during disease as well as in health—is amply justified.

The Seal of Acceptance denotes that the nutritional statements made in this advertisement are acceptable to the Council on Foods and Nutrition of the American Medical Association

# NOW AVAILABLE AGAIN

The Original Enteric Coated Tablet OF THEOBROMINE SODIUM ACETATE

# to control frequency and severity of attacks in CARDIOVASCULAR AND RENAL DISEASES and to prevent EDEMA

Clinical experience and studies have proven the value of Theobromine Sodium Acetate in certain Cardiovascular and Renal Diseases In Angina Pectoris, used adequately, it permits more work by the individual without developing precordial pain or distress. As one of the most effective Xanthine Vasodilators it helps increase the available blood supply to the heart and kidneys to increase the efficiency of these organs

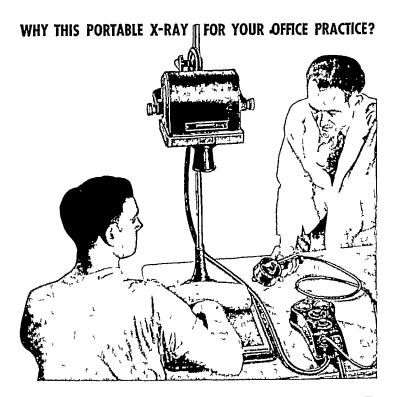

It has also been found an effective aid in treating and preventing Edema of Cardiac or Renal origin. The enteric coating (especially developed for Thesodate) permits larger doses without the drug's contact with the Gastric Mucosa

Supplied-in 71/2 grains wi h and with out Phenobarbital 1/2 grain in 5 grains with Potassium Iodide 2 grains and Phenobarbital 14 grain and in 324 grains with and without Phenobarbital 14 grain Capsules not enteric coated, are available in the same pot noies for supplementary medication.

# Reducing Diets

K NOX GELATINE is especially valuable when you must plan reducing diets containing supplementary protein.

Knox is pure, unflavored gelatine that is all protein, no sugar decidedly different from factory-flavored gelatine dessert powders which are 85% sugar

To all reducing diets, Knox Gelatine salads and desserts can add variety and interest. Many of these dishes contain high-residue, low-calorio foods, especially helpful in staving off hunger

Drinking Knox in water or in diluted fruit juices between meals is another good, low-calorie way to combat hunger and make dieting easier

If You Wish FREE Diets and Recipes write to Knox Gelatine, Johnstown, New York.

Ferrous Gluconate Stabilized is useful to promote rapid hemoglobin regeneration ın hypochromic anemias.

DOSAGE: Of the tablets for adults 3 to 6 per day; for children 1 or 2 per day Of the Elixir, for adults, 4 to 8 tenspoonfuls daily; for children, 1 to 4 tenspoonfuls daily

Detailed literature available upon request

George A. Breon & Company

KANSAS CITY MO **NEW YORK** ATLANTA LOS ANGELES SEATTLE

The combination of

Sulfamerazine Microcrystalline 1.5 Gm (22 gr) Sulfadiazine Microcrystalline 1.5 Gm (22 gr)

is presented in Mer Diazine. Equal parts of sulfamerazine and sulfadiazine have been found by Flippin et al\* to lead to a markedly decreased incidence of crystalluria compared with that observed when either compound was administered singly. The use of sulfonamide mixtures avoids certain disadvantages associated with the administration of sodium hierbonate.

## Liquoid Mer-Diazine-

presents a palatable, homogenized suspension of these two sulfonamides. The microcrystalline form in which the drugs are present assures the most rapid absorption slow excretion of sulfamerazine makes maintenance of a suitable blood level relatively simple both sulfas penetrate readily into ascitic, pleural and cerebrospinal fluids. Liquoid Mer Diazine provides convenience in administration—particularly useful in pediatries. Warning Sulfadiazine and Sulfamerazino may cause toxic reactions.

Apallable in 4 ft ou, and pint hattles. Sample on request,

# SYSTEMIC REHABILITATION

# Gainful occupation restored

For long lasting alleviation of pain and restoration of function in arthritic patients, systemic rehabilitation has been found to be the most rational therapeutic regimen.

Darthronol is widely ac cepted as an important thera peutic factor in the systemic rehabilitation of the arthritic. The beneficial annuarthritic ef fects of the contained massive dosage of vitamin D, the im provement of appetite de crease of pain, restoration of normal digestive function and general well being—which so frequently follow adequate dosage of Darthronol—all tend to hasten recovery and make possible the return to a gainful occupation

#### **EACH CAPSULE CONTAINS**

Vitamin D (irradiated Ergosterol)	50 000 U S P Units
Vitamin A (Fish-Liver Oil)	5,000 U.S P Units
Ascorbic Acid	75 mg
Thigmine Hydrochloride	3 mg
Riboflavin	2 mg
Pyridoxine Hydrochloride	0.3 mg
Calcium Pantothenate	1 mg
Niacinamide	15 mg
Mixed Tocopherois	4 mg

(Equivalent to 3 mg of synthetic Alpha Tecopherol)

For the Anthritic DARTHRONOL

Changes of die and of daily living routines during the summer months are prominent factors in the etiology of such intestinal upsets as constipation or diarrhea with constipational sequelae

NEO CULTOL\* offers a physiological means of restoring normal intestinal function in cases where stasis is present. It acts by implanting a viable, aciduric culture of Lactobacillus acidophilus which counteracts putrefactive processes. • Gently lubricating. • Palatable. • Non habit forming. • Melting point adjusted to prevent leakage.

# Try this Yourself,

Doctor..

Rare is the person who does not enjoy a piece or two of candy at the end of a meal. The satisfying goodness of candy creates an aura of well being which, postprandially, is conducive to good digestion of the meal just eaten

That candy has a worth-while place in the dietary is evident from the foods with which most candies are made—eggs, butter, milk, fruits and nuts. To the extent these foods are present, candies contribute valuable protein, B complex vitamins, and minerals.

In the sickroom, candies serve a double purpose They frequently are eaten when many foods are refused because of anorexia, and serve to provide high caloric value in concentrated form. Of equal significance, convalescent patients usually experience a distinctly beneficial psychic lift from a tasty piece or two of candy

These unique advantages of candies more than justify their inclusion in the daily dietary, not only of adults, but of children as well

COUNCIL ON CANDY OF THE

## BRISTOL Penicillin in Oil and Wax is now

### for easier administration

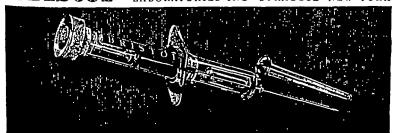

Now you can inject Bristol's Crystalline Sodium Penicillin G in Oil and Wax (Romansky Formula) with far greater ease than in the past Due entirely to changes in the manufacturing process and without any alteration in formula, the viscosity of the product at room temperature has been brought to a point which approximates that of USP glycerin Clinical studies meanwhile indicate no change in the ability of the product to maintain adequate levels of penicillin in the blood for about 24 hours

This is a significant development in penicillin therapy Specify Bristol and obtain the benefits of LIQUID Romansky Formula

Supplied in one cc car tridges of 300,000 units with or without special syrings equipment and in 10 cc rubber-stoppered vials Needs no refrigera tion in storage or warm ing before use

NUMBER 14

## Editorials

#### Rocky Mountain Spotted Fever

Rickettsul disease has been noted in many places in this country. The popular designation of this frequently fatal illness is no longer appropriate and the almost epidemic occurrence in the eastern end of Long Island has aroused the attention of physicians, health authorities, and the public, as might be expected with a malady which is accompanied by a death rate of approximately 20 per cent. Perhaps Eastern spotted fever would be the better term. The tick is widely distributed in the areas where it has caused widespread infection among a number of hosts, among which the dog appears to be the favorite. The season for its depreda-

tions is largely during July and August, and in order to bring the matter to the attention of physioians, the Journal is devoting the majority of its pages in this issue to a timely symposium held at the Southampton Hospital last August under the direction of Dr Shepard Kreeh and authorized by the Board of Directors of that institution

The symposium is a well-rounded presentation deserving of the attention of practicing physicians who should make themselves acquainted with a disease which apparently may escape detection from lack of knowledge of its signs and symptoms.

#### Decay of the Family?

It is alleged that the institution of the family in Western civilization is going on the rocks. Life magazine discusses the question editorially, pointing out that according to Dr Carl Zimmerman, Harvard sociologist, "the Western family has collapsed twice before, in Greece about 300 B C and in Rome about 300 A.D., in each case mark-

ing the decline of those states." Decay of the family in Greece and Rome was marked by corruption, vanishing birthrate, demigration of parents, juvenile and adult delinquency, says Life

Certainly, accumulating statistical evidence seems to lend weight to the warnings from many sources that something is happening to the modern family Such a state

1 March 24 1947 p. 36

of affairs should be of the gravest concern to doctors of medicine It is probably inevitable that as civilizations evolve from their simpler, more rudimentary forms to then complex maturity the diseases of industrial middle age and early atomic-age senescence invade their cells destructively Spengler elaborated the thesis in his Decline of the West some time ago

If the family decays, what then becomes of the family doctor? The ready answer would be that he becomes the decayed-family doctor How near to that status is he now? If the decay of the family is marked by the symptoms recited in our first paragraph, should not medical educators, medical societies, and others interested in the future of medicine, give thought to the fact that a falling birthrate will necessitate fewer obstetricians and pediatricians, but probably more gynecologists, genitourinary practitioners, and psychiatrists The decayed-family practitioner could conceivably be a combination in one person of formerly separate specialties hest calculated to make of him a decayed-family friend and counselor His premedical curuculum could include law, sociology, the rudiments of police work, philosophy with special emphasis on Spencer and Spengler. abnormal psychology, the rudiments of statism, with possible some attention to English composition

The medical curriculum could well omit any attention to all but a certain few infectious diseases, substitute nuclear physics and diseases of irradiation, which may be reasonably expected to increase as more and more radio-active gases and other substances There you have the ideal, are released shortened course to produce the decayed-Medicine should be family practitioner ever on the elect to be functional in its service to humanity, wherever that may lead, even to the establishment of the qualifications and training of decayed-family doctors, if need be

#### The Pariah

Some time ago—it has taken us weeks to recover from it—ne received a shock attractive young lady—we use the term advisedly-consulted us Her symptoms were out of all proportion to her physical signs What they were is of no importance What caused their exaggeration is of great importance

She had been promised occupation in one of our oldest Long Island towns, one more than two hundred years old, and founded. unless we are much mistaken, by the Quakers, a sect which laid great stress on tolerance She could find no place to live We proffered the usual platitudes about the unusual housing shortage, the returning veterans, etc, ad nauseam She seemed strangely inconsolable

"That's not it, Doctor I never expected to find a house, or even an apartment I wanted was a room in a decent house There are plenty of them all over town I am barred because of my profession "

We straightened in our chair profession? How many were there? Wife, mother, scrubwoman, stenographer, typist, secretary, business woman Our incredulous mind whirled, stumbled, and finally came to a stop on woman's oldest profession It was the only one that we could think of that would bar this attractive girl from board and lodging in a respectable Long Island Any doctor, regardless of his private life, should be able to recognize the earmarks of a prostitute, professional or amateur Our patient had none of them

A moment, laden with uncomfortable silence, passed Finally, gathering courage, we asked,

"What is your profession?" "I am a schoolteacher"

We took three long breaths and flushed "And what is the objection to with shame taking a schoolteacher as a boarder?"

"Because we make so little money cause our clothes are not the latest thing Because we can't use lipstick " She was on "Because as inmates of a the verge of tears decent home we cannot put up as presentable an appearance as a factory worker "

Our New England mind flashed back a hundred years to the times in the State of Maine of which our great-great aunt used to tell us when money was unknown and learning was esteemed. Days when having the schoolteacher board with you during the term was an honor eagerly striven for and proudly worn Days when every farm accessible to the school-three, five, ten miles were distances of reasonable access—harbored a boy who worked for his board in order that he might get an educa-Days when pupils walked those distances, back and forth, drawn by the magnet of the schoolteacher Days when an education was a prize to be fought for. not a bolus to be rammed down the reluctant throats of unwilling children by the hands of an instructress socially regarded as slightly lower than the factory worker A pretty comment on a community that has traded the worship of Athene for the idolatry of Mammon

These reflections have been brought to the surface by the recent accounts of teachers strikes upstate We think all strikes are bad, and that if teachers strike, like policemen and firemen, it sets a peculiarly had example We recall the words of Calvin Coolidge—that unfashionable dead man who did not choose to run—"There is not right to strike against the public safety anywhere, any place, at any time"

Education should be the noblest profes sion in the world. The lowhest public schoolteacher has a moral opportunity which is vouchsafed to few, even were many of us sufficiently bold and unselfish to undertake it. When we speak of educators we are likely to think of college professors and college presidents. We forget at least most people do, how infinitely more important are the teachers who shape the lives of our children from their tenderest and most impressionable years up—or down

And these teachers cannot become boarders in a decent home in a decent community of old New England and Quaker ancestry

If that is not something for the medical profession to consider, it does not recognize what sickness is

#### Current Editorial Comment

Penicillin in the Treatment of Early Syphilis The multiplicity of the types and forms of syphilis, the numerous variations in the manner of administering penicillin, as regards the size and frequency of dosage, the preparation used, the route selected, the total dose, the period of time for one course of treatment, and the variations m the amounts of fractions F, G, K, and X in penicillin constitute a gigantic problem that is slowly being solved by the labors of thousands of clinicians contributing, from time to time, bits and fragments of additional information. In the January 4, 1947 issue of the Journal of the American Medical Association, the first fifteen pages of scientific matter were devoted to the elucidation of the problems of syphilis and the effects of treatment with penicillin. The three articles deal with early syphilis, neurosyphilis, and early congenital syphilis

Sternberg and Leifer<sup>1</sup> reported on their analysis of the records of 1,400 soldiers with early and latent syphilis treated between

June, 1944, and February 1, 1945 Each patient received a total dose of 2,400,000 units of sodium penicillin in aqueous or isotonic solution of sodium chloride, administered intramuscularly in 60 equal doses of 40 000 units every three hours over a period of seven and one-half days Reactions included the Herxheimer, urticaria, and various other cutaneous cruptions, but none was serious enough to require interruption of treatment.

The results of the single course of treatment in 1 400 soldiers were considered satisfactory in 90 6 per cent, and unsatisfactory in 94 per cent. The best results were achieved in those patients with seronegative primary syphilis—94 3 per cent, the next best in seropositive primary syphilis—89 9 per cent, and in secondary syphilis the results were favorable in only 83 per cent. Among 790 white patients, the unsatisfactory rate was 5 per cent among 610 colored patients, it was 15 per cent. Those rates probably are due to reinfections which are three times greater in the colored. This is to be ex-

pected, since the syphilis rate for negro troops has been consistently twelve to fifteen times that of white troops. In about one half of the patients, the cerebrospinal fluid was examined (all but 79 after six months) and found normal in 99 31 per cent. This report is encouraging, but its value is diminished because of the short period (over nine months) of follow-up. It indicates that in early syphilis, the need of more intensive treatment is in direct proportion to the progressive stages of seronegative primary, seropositive primary, and secondary

The results achieved in 100 cases (largely psychotic) of neurosyphilis treated with penicillin at the Boston Psychopathic Hospital, and followed for one year or more, are reported by Rose and Solomon 2 In all except 19 cases treated with penicillin alone, the patients received both penicillin and malaria, or penicillin plus treatment in a fever cabinet in amounts equal to about one half of the generally accepted standard course of treatment with penicillin consisted of a total dose of 3,000,000 units administered intramuscularly, the individual dose varying from 25,000 to 50,000 units, the time interval from two to four hours, and the duration of the course from five to fifteen days

Patients who failed to show improvement in clinical condition and in abnormal spinal fluid at the end of two months, and those with abnormal levels of cell count and protein content at the end of six months were retreated with penicillin alone in the same an ount and at the same frequency

The results in 75 patients with dementia paralytica were as follows with penicillin plus malaria, 71 per cent were improved, with penicillin plus fever cabinet, 63 per cent improved, and with penicillin alone, 66 per cent improved The average of all three methods of treatment was 69 per cent improved These results compare favorably with older methods of treatment 100 reported, retreatment was necessary in 36 patients Following treatment, the cell count returns toward normal in three to six months, the protein in six to nine months, and the Wassermann titer decreases more Of the 100 cases followed for a year or more, only 11 patients had negative Wassermann reactions Because more than a third of the patients required retreatment with penicillin, the total dose of that drug used in the treatment of neurosyphilis has been increased from 3,000,000 to 6,000,000 units

Five cooperating university clinics furnished the information assembled and reported by Platou et al 3 on the effects of penicillin treatment in 252 patients with early congenital syphilis Of the 252 infant patients, 86 9 per cent were colored, 53 1 per cent were girls, 857 per cent were less than one year old, and the remaining 143 per cent were in the second year of life total dosage of penicillin varied from 770 to 150,000 units per kilogram of body weight For schedules of 40,000 units or less (per Kg of body weight), the drug was usually administered in aqueous solution, divided into 60 equal doses given intramuscularly every three hours over a period of seven and one-For the larger schedules (100,000 half days units per Kg), the same plan was followed except that the total dosage was divided into 120 equal injections given over a period of fifteen days

In 171 infants the spinal fluid examined before treatment was abnormal in 62 6 per cent. Among 91 infants the spinal fluid was abnormal in 72 5 per cent. In the latter group, penicillin treatment reduced the abnormalities from 72 5 to 20 9 per cent. Abnormal spinal fluid is commonest in the younger infants, it improves under treatment, has a tendency to disappear or improve spontaneously, is rarely accompanied by clinically recognizable neurologic disorders, and has little prognostic significance. As time passed after treatment, the results were increasingly satisfactory. Clinical relapses in the entire group were only 2 4 per cent.

Among those followed for more than sixteen months, the patients clinically well and serologically negative increased from 11 1 to 69 2 per cent

Among 252 infants with congenital syphilis a single course of penicillin was followed by satisfactory results in 73 per cent, unsatisfactory in 91 per cent, and uncertain in 179 per cent. From their experience with this series of 252 cases, the authors recommend that syphilitic infants should receive a total dosage of at least 100,000 units of penicillin per kilogram of body weight, and that this amount should be divided into 120 equal intramuscular injections given at intervals of three hours over a period of twelve to fifteen days

ON

#### EASTERN ROCKY MOUNTAIN SPOTTED FEVER

PRESENTED AT SOUTHAMPTON HOSPITAL, NEW YORK AUGUST 24, 1946

#### INTRODUCTION

SHEPARD KRECH, M.D. President of the Board of Directors

R OCKY MOUNTAIN SPOTTED FEVER, or Eastern Spotted Fever has been in digenous to this locality for many years. Of all the cases that have been recognized and reported in New York State one third have been treated in this hospital

It was not until a few years ago that the in terest of the health authorities, medical profession, and the public became fully aroused At that time several cases occurred which apparently had a definite relationship to infected dogs. Dr Norman H. Topping and Dr Charles C Shepard were sent here by the United States Public Health Service to review the cases and make some serologic studies of dogs. During the summer of 1946, Dr John K. Miller and Dr

Robert D Glasgow were delegated by the New York State Department of Health to set up a field laboratory and conduct entomologic studies at Montauk. It therefore seemed that the time had come for a thorough discussion of the problem and the Board of Directors of the Hospital authorized this symposium. It should constitute a scientific contribution of value as well as be of some educational significance. It is also designed as a demonstration of cooperative effort on the part of a small rural hospital and its staff with various government health authorities toward the solution of a community problem

Preliminary to a discussion of the various aspects of the problem 2 typical cases are presented

#### CASE REPORTS

Reported by Dr Herman B Rubler, Hampton Clinic, Hampton Bays Long Island—G L. a white man, aged 42 a native of Southampton, New York, was taken ill on July 1 1946 complaining of head aches of moderate severity, chills and fever with generalized aches and pains. Up to the date of onset he was working and felt perfectly well. During the day his headache became more severe and his temperature rose to about 102 F. The following day because of the severity of his headache and a continued rise in temperature to 104 F. the patient went to bed. He consumed a considerable amount of fluids and aspirin but took no nourishment After spending another sleepless night he sought medical advice. Hospitalization was recommended and on the following day July 5 he was admitted to Southampton Hospital.

The admission history revealed that the patient was a plumber by trade and had worked outdoors most of the time. He was compelled to lie in deep grass where ticks were prevalent and stated that be frequently brushed ticks from his clothing He gave no history of drinking water or milk from any doubtful source. His home surroundings were clean. He had not traveled outside of Southampton during the preceding few months.

The past history was negative except for the usual childhood illnesses. He had received no immunisa

tion against typhoid or typhus fever

Examination revealed a fairly well-nounshed white man who appeared acutely ill. His face was flushed his akin dry and the respirations were somewhat rapid. There was no cough. The pupils were equal and reacted to light and in accommodation.

His ears were normal and the mucous membranes of the nose and throat were injected The neck was normal except for some spasm of the muscles. there was no rigidity and the cervical glands were not en-The lungs were normal to percussion and auscultation The heart sounds were of good quality, with no murmurs or arrhythmias The heart was not enlarged, the pulse rate was 92 The blood The abdomen was soft and pressure was 134/84 the liver and spleen were not enlarged There was a well-healed scar in the right lower quadrant, the result of an appendectomy There were no areas of tenderness or spasm The extremities were normal and the reflexes were physiologic The skin showed a few scattered, rose-colored macules on the anterior surface of both ankles and wrists, which disappeared readily on pressure The temperature on admission was 105 2 F, the pulse was 96, and respirations were The blood count revealed a hemoglobin of 80 per cent, red blood cells 4,320,000, and white blood cells 4,400 with polymorphonuclear leukocytes 73, lymphocytes 24, and monocytes 3 The urine showed albumin 1 plus, occasional hyaline, granular, and pus casts, and a few white blood cells Felix-Weil reaction was negative

A diagnosis of Rocky Mountain spotted fever was made and the patient was given 2 Gm of para-aminobenzoic acid every two hours, together with 10 grains of sodium bicarbonate. An ice cap was applied to his head, he was given codeine and aspirin for headache, and pentobarbital for insomnia

The day following admission the macular rash on the ankles and wrists disappeared, and the patient felt somewhat better but toward evening his headache became more severe and the temperature, which had dropped to 99 8 F the previous evening, rose to 104 F. The rash reappeared on the wrists and ankles and also on the abdomen and chest. The Felix-Weil test was repeated and it was positive in the following dilutions. Proteus X K 1 40, Proteus X 2 1 80, Proteus X 19 1 80. On July 9 the Felix-Weil reaction was positive in the following dilutions. Proteus X K 1 40, Proteus X 21 320, Proteus X 19 1 160.

The para-aminobenzoic acid was continued, and the patient was given a transfusion of 500 cc of citrated blood on the sixth day after admission temperature remained elevated until the sixth day, when it went down to 99 F It became normal on the eighth day and remained so until his discharge on the thirteenth day His headache persisted until the eleventh day in the hospital He remained lethargic for seven days after admission, when he suddenly began to take notice of his surroundings He complained of partial deafness for this same period His rash persisted almost until his discharge from the hospital During the period of hospitalization he lost about 13 pounds At the time of discharge he felt weak and irritable and remained so for two or three weeks He also complained of insomnia was placed on a high calone diet, supplemented by vitamins and liver extract

The patient made an uneventful recovery and returned to work four weeks after discharge from the hospital, having fully regained his weight and strength

Reported by Dr Emma L Bellows, Southampton, Long Island—J P, a robust man, aged 45, was admitted to the Southampton Hospital July 20, 1946, with a diagnosis of tick fever

Six days prior to admission the patient was taken ill with chills, fever, intense headache and backache. The temperature ranged and great restlessness from 101 F in the morning to 103 F in the evening. Physical examination at his home was essentially normal He received 100,000 units of penicillin on two successive days On the morning of the fifth day of illness, he developed a slight, scattered rash on the dorsa of the feet The lesions were macular and rose-colored, and disappeared on pres-There were not more than ten or twelve mac-There was no evidence and no ules on each foot history of a tick bite, but the patient had a dog. had often picked off ticks without proper precautions and had suffered many flea bites

Upon admission, the patient was in no apparent distress except for headache. The rectal temperature was 102 F, the pulse was 120, and blood pressure was 120/80 The face was flushed, the gums red and slightly swollen, and the throat normal The pupils reacted to light and accommodation The sclerae were injected There was no discharge from the nose or ears, and the tongue was clean There was no rigidity of the neck and no palpable cervical glands The chest showed good expansion, was resonant throughout, and no rales were heard The heart was not enlarged, the sounds were regular and of good quality, and there were no thrills or murmurs The abdomen was soft, with no tender areas, and there was no enlargement of the spicen or The hands and arms were normal, on the dorsa of both feet were rose-colored macules which disappeared on pressure Later these became purplish in color and did not disappear on pressure They did not spread to his legs The knee-jerks were active

The patient was given an initial dose of 3 Gm. of para-aminobenzoic acid in chilled 5 per cent bicarbonate of soda, followed by 2 Gm every two hours. This was continued throughout his ten days' stay in the hospital. Other treatment was symptomatic.

On the second day his temperature dropped to 101 F in the morning and 100 2 F in the evening. It continued this way for three days, and then dropped to 99 4 F in the morning and 99 8 F in the evening for another three days, with occasional rises to 100 F. On the minth day the temperature was 98 4 F in the morning, and 99 2 F in the evening, and it was normal thereafter. The patient compluined of headache as long as he was receiving para-aminobenzoic acid, but this stopped when the drug was discontinued.

Laboratory Findings—The complement fixation reaction was positive On July 20, 1946, a Felix-Weil test was made, and the Proteus K reaction in 1 40 dilution was negative, Proteus 2 was negative, and Proteus X 19 in a 1 80 dilution was positive. The urine showed a specific gravity of 1 020, albumin was 1 plus, and there was sugar content. The blood had a 95 per cent hemoglobin, 4,880,000 red blood cells, 7,850 white blood cells with 77 per cent.

polymorphonuclears 21 per cent lymphocytes and 2 per cent monocytes.

On July 25 1946 the blood contained 5 500 white blood cells 60 per cent polymorphonetilears 39 per cent lymphocytes and 2 per cent money tes. On July 26 the Proteus \ 10 was 3 plus in a dilution of 1 20 3 plus in a dilution of 1 40 1 plus in a dilution of 1 80 and 1 plus in a dilution of 1 160 On July 29 the para aminobenzous acid blood level had a total of 4 40 4 01 free and 0 45 conjugated. The red blood count was 5 050 000 white blood count was 5 100 with 54 per cent polymorphonuclears and 46 per cent lymphocytes.

#### Conclusion

It will be noted that J. P. had a mild attack. After the para-aninobenzole acid was started his temperature came down by lysis his rash did not spread to other parts of the body. The muscle pains

in the back disappeared he was in good spirits but complained bitterly of a headache and attributed it to the drug as the headache always became worse soon after the administration of medicine. His blood count remained good in spite of large doses of para aminobenzole acid. There was no tendency to anemia or leukopenia or albuminuma. We were disappointed that we could not get his para aminobenzone acid blood level up to 10 mg per 100 cc. of blood which is considered the best level.

His dog was submitted for examination and the complement fixation test was strongly positive for Eastern spotted fover

We believe that para aminobenzone and definitely shortened the course of the disease in this man. Recovery was not spectacular but in comparing him with other cases in this neighborhood in previous years we feel that the short duration and lack of toxemia were due to the administration of the para aminobenzoic acid.

#### CLINICAL EXPERIENCES IN EASTERN SPOTTED FEVER

LERAY BARRETT DAVIS, M.D. Westhampton Beach, New York

(From the Southampton Hospital)

SINCF 1913 when the first recognized case of Lastern spotted fever on Long Island was recorded by Dr David Edwards approximately 100 have been reported in Suffolk County Of these 30 cases were admitted to Southampton Hospital during the period from 1933 to 1946 Statistics show that all cases in New York State exclusive of New York City occurred in Suffolk County except for 3 cases in Nassau County and 1 infection in a laboratory worker in Rockland County It, therefore becomes evident that this hospital has cared for almost a third of all cases reported in New York State, outside of New York City 1

There were nine deaths in the 30 cases a mor tality rate of 30 per cent, indicating the severe nature of the disease in this area. Men accounted for 57 per cent of the cases and women for 43 per cent. In the West most of the victims are men, but here they seem about equally divided probably because of the role played by the household dog, the favorite host of our Eastern tick. Dermacentor variabilis. The youngest patient was 2½ years old, the oldest 78

Strangely enough a definite history or scar of a tick bite was recorded in only 12 or 40 per cent of the cases Parker states that often a tick bite cannot be found 2 and Baker reports that attached ticks are not usually present. 3 This seems to lend strength to the theory that the Rickettera may infect through unbroken skin

All patients were exposed to ticks and in some of the severe cases a history of deticking dogs with bare fingers was given. This tempts one to dwell on Parker's 'reactivation theory' that the virulence of the Rickottan may be increased sharply by a fresh blood feeding and emphasizes the danger of ticks on household pets

One of the best definitions of Rocky Mountain spotted fover is Cecil s. Rocky Mountain spotted fever is a specific infectious endanguits, transmitted by ticks characterized by chills fever and a macular cruption, becoming petechial which appears first on the wrists and ankles."4

A careful study of the records seems to indicate that there are some moderate differences between the Eastern spotted fever, which we see locally and the Western or Rocky Mountain spotted fever described in most of the literature Recognized authorities have contended that one type is not the same or an extension of the other but that each had a separate origin many years ago 2.3 It is reasonable to assume that dissimilar features would exist

#### Symptoms

Of the symptoms none is more constant or outstanding than the headache. It is usually frontal but may be occipital. The expression is almost typical—the eyes closed but with a fearful tenseness as if the next minute would bring pain beyond endurance. Severe chils often usher in the illness followed by a fever of 104 F to 105 F and profuse diaphoresis. There is great malaise with muscle and joint achiness. Distincts and in somnia are common. Vomiting and diarrhea are rare.

#### Signs

The temperature soon rises to a high level, often spiking at first, but maintaining a plateau effect during the second week and declining by lysis the third week. The highest temperature recorded was 108 3 F in a young adult before death. The almost invariable termination of fever at twenty-one days without specific treatment was striking in this series. The pulse rate is usually from 90 to 110 per minute and in the early stages is quite disproportionate to the fever Baker noted this as characteristic.<sup>3</sup>

The headache is persistent and seems to be the forerunner of many signs of upper central nervous system disturbance The word "lethargy" is repeated constantly in the charts, delinium is common, and one young adult died in a wild dehrium of screaming and convulsions Restlessness, insomnia, twitching, confusion, deafness, and irrational behavior are words frequently found in the records Personality changes are not infrequent and are sometimes alarming to Rigidity of the neck is recorded in a few cases, but reflexes in general are not reported as abnormal, the highest areas of the central nervous system apparently receiving most of the pathologic insult due to minute circulatory disturbances

The rash is a diagnostic anchor and was typical in all 30 cases It is described in these records as a scattered, pink, macular rash, each macule from 1 to 5 mm in diameter, disappearing on pressure, and gradually within a few days becoming petechial and a deep red to purple color The eruption appears first on the forearms and wrists, legs and ankles, and spreads to the back, thighs, buttocks, and chest, in that order In short, it spreads centripetally, a differential point from typhus, which spreads centrifugally, from the trunk outward 3 A sign which we in this hospital have considered most reliable is the presence of the rash on the palms and soles In no case did the lesions go on to hemorrhage or necrosis, as described in the Western type The largest macules measured about 5 mm in diameter

Flushed face and conjunctivitis were described consistently, photophobia frequently

Another difference noted in this series was the infrequence of splenomegaly. In only 6 cases, or 20 per cent, was the spleen definitely noted as enlarged. Rose did not find an enlarged spleen <sup>5</sup> Baker notes enlargement of the spleen and often the liver as a regular finding in the West <sup>3</sup> Lymphadenopathy was not noted.

A cough was present in many of the cases, but pneumonia was a complication in only 10 per cent Diaphoresis was profuse and persistent—Studies of the spinal fluid were neither diagnostic nor characteristic In the fluids of 7 cases taken, the cell count ranged from 0 to 35, and globulin from none to a trace

The blood cytologic studies were likewise indeterminate If we accept 5,000 to 10,000 leukocytes per cubic millimeter as a normal range, according to Kolmer and Boerner, 70 per cent of the cases showed a normal count and 27 per cent showed an increase Throughout the series, the differential count was within normal limits. This differs from reports on the Western type, in which the leukocyte count averages 12,000 to 15,000 per cubic millimeter, and 10 to 15 per cent mononuclear cells.

Except in the terminal phase of the fatal cases, all urine analyses were remarkably free from abnormal change, even in the very acutely ill

The Felix-Weil tests in this series were reported by the New York State Department of Health, and ranged from 1 to 40 to 1 to 2,500 All sera were tested for agglutination by Proteus X 19 No positive reaction was obtained before the eleventh day of illness, which makes this test lose significance in the early days of a questionable illness Rising titers, to which we now attach so much importance, were noted consistently where serial tests were performed. Agglutination test with OX2 was done in 1 case in 1942, as was complement fixation. At present we are giving much attention to the latter.

### Complications

Pneumonia was a complication in 3 patients, or 10 per cent, all of whom expired The pneumonia was bilateral and basal, and all cases occurred before the advent of chemotherapy

Hemorrhage was not seen, nor was necross of the skin

One patient was discharged with deafness, but there is no notation as to its permanence

#### Deaths

Thirty per cent of this series expired There were no reports of postmortem examinations A study of the charts indicates that death usually occurred from a prolonged febrile exhaustion of the whole organism, very much like a typhoid state. The usual signs of circulatory failure were not observed, renal function seemed to hold, and the gastrointestinal traft seemed little involved.

#### Treatment

Before 1943 the treatment in this hospital was supportive and expectant Fluids, sponge baths, mild sedatives for restlessness, and exhaustive nursing care were given

In 1943 anti-Rocky Mountain spotted fever serum obtained from rabbits was first used Of the 4 cases in which it was administered, 3 re-

covered and 1 died In 1944, of 4 cases in which it was used, 2 recovered and 2 died In 1945, of 4 cases in which it was used, 3 recovered and 1 died This gives, for three years a mortality rate of 331/2 per cent, which is no improvement over the total mortality rate On analysis one observation can be made, namely, all patients who recovered were given serum on or before the seventh day of illness while in those who died, in all cases except one the serum was given after the seventh day The one exception was a 78-year old woman who received 80 cc of serum without improvement. In some cases the change in the temperature curve after serum was impressive In this small number of cases, one is not warranted in drawing conclusions Difficulty in obtaining the serum and fear of reaction often prompted dosage less than the recommended 1 ce per kilogram of weight.

Topping reported a 3.8 per cent fatality rate in patients treated by serum within three days of onset, as against a rate of 18.8 per cent without serum and with serum after three days, indicating that serum must be given early?

The sulfonamide drugs were tried briefly with

out benefit

Penicillin was used in 2 cases, each receiving 160 000 units daily for nine and thirteen days respectively, with no apparent change in condition or temperature. In one of these it was used in conjunction with serum, without avail in saving the patient

Baker claimed good results with intravenous injections of neoarsphenamine in aqueous metaphen, but I could find no confirmation of this

The past year brings the advent of para-ammobensoic and in treatment, suggested because of its success in typhus. I have not included the 3 cases in which the drug was used this year, for our experience has been too limited and our early dosage somewhat low

Anigstein and Bader reported good results from its use in guinea pigs, and Rose, Duane and Fischel had excellent results in a case reported in 1945. This drug holds great promise, but only time and experience will determine its value, as well as that of the serum, in reducing the serious mortality rate of this disease

#### Prevention

All residents of the coastal area of Long Island will attest to the fact that each year the number of ticks is increasing. The increase in incidence of Eastern spotted fever has not kept pace, but, fundamentally the control of the disease must aim at elimination of dog ticks. Fortunately, during the past year New York State has initiated two separate programs for the study of ticks in this area, and the Suffolk County Mosquito

Commission was empowered by the State Legislature to extend its activities to tick control

In 1945 a civic broup in one of the Hampton villages\* began a creditable campaign to prevent spotted fever Basing its program on information from Carroll N Smith,\* an authority on dog ticks, a three-point plan was used (1) education of the public, (2) attention to dogs, and (3) cleaning and burning of overgrown areas in the village Of the three the educational feature was the most successful Concise informative pain phlets were distributed by mail Thie pamphlets described the characteristics of the dog tick, how to avoid attachment, how to care for dogs by deticking, and the use of derris powder baths together with a few basic truths about Eastern spotted fever

During the last two summer seasons hundreds of persons in the Hampton area have been vaccinated with the chick embryo vaccine. Its value has not yet been determined. No case in this series had had vaccine prior to illness.

#### Summary

1 Since 1913, 30 cases of Lastern spotted fever, or about one third of all cases in New York State, exclusive of New York City have been admitted to Southampton Hospital These 30 cases are subjected to analysis The mortality rate was 30 per cent The cases were about equally divided between the sexes, and the ago range was 2/1, years to 78 years

2 History or scars of tick-bites were found in only 40 per cent, indicating that infection may

take place through unbroken skin

3 Essential differences from the reports on the Western type of spotted fever are noted These are in particular (1) lack of cutaneous necrosis, (2) infrequency of splenomegaly (3) normal leukocyte and differential blood counts and (4) equal occurrence in both sexes

4 The rash appeared in from three to five days after onset was discretely macular becoming petechal beginning on the forearms and wrists legs and ankles and spreading to the trunk. The appearance on the palms and soles was considered important

5 Examination of the spinal fluid is not help-

ful in diagnosis

6 Positive Felix Well agglutination reactions were not obtained before the eleventh day of ill ness. Rising titers in series tests were consistently noted

7 An impressive feature of this disease is its profound effect upon the higher sections of the central nervous system. Severe headaches lethergy, restlessness, insommu irrational behav

<sup>\*</sup> Westhampton Beach.

ior, and personality changes were frequently noted

Fever soon reaches 104 to 105 F, and de-8 clines by lysis in about twenty-one days pulse is usually disproportion itely low

Complications are few, pneumonia occur-One patient, on disring in 10 per cent of cases

charge, had loss of hearing

Fundamentally, prevention of Eastern spotted fever must aim at destruction of ticks, a Local attempts are now in difficult problem Many persons are receiving tick vacprogress one injections

From 1943 through 1945, 12 patients were 11 treated with anti-Rocky Mountain spotted fever serum, from rabbits There was no decrease in mortality among patients given the serum late in the disease, but decided benefit, with one exception, was obtained in those receiving it seven days or less after onset Early administration is mandatory

The sulfonamides and penicillin had no 12 effect in the very few cases in which they were Para-aminobenzoic acid showed promise in 3 cases, not included in this series

#### Discussion

Dr David Edwards, East Hampton, New York There are a few points on which I do not agree with Dr Davis, but perhaps it would be better at this time for me to go over what I saw years ago imagine there have been many cases of Eastern spotted fever which have not been recognized. The first case about which there was any question I saw ın 1912 Mrs M, wife of the gamekeeper at Gardiner's Island, complained of fever, headache, malaise, pains in the muscles, and a rash, and was very ill I thought at the time that it might be due to a tick bite At the same time, the owner of the property, Mr L G, was in the Presbyterian Hospital in New York City I obtained his chart report later, and from it learned that he had had a rash, headache, and other symptoms, not as severe as those of Mrs M, but it seemed to be the same type of illness His case had been diagnosed at Presbyterian Hospital as "fever of unknown ori-

The following year Mr H M, the husband, was taken with a severe illness He had been bitten by a tack and evidence of the bite-a brown spot about the size of a 5-cent piece on the right foot-was present when I saw him He had a rash which appeared first on the extremities-palms, soles, wrists, and This eruption was macular at first and then became hemorrhagic, petechial It disappeared under pressure at first, but not later He was very ill for a long time, and still feels that his poor health after all the intervening years is due to the tick bite I haven't seen him lately At the time of his illness I got Dr Cunningham from the training ship, Newport, and Dr Lewis also to see the case with me, and

we came to the conclusion that we should report it in the United States Public Health Service Dr D L. Van Dine came to town and, as I recall it, felt we did not have the variety of tick at Gardiner's Island which would carry the disease I still thought that there was a possibility

As far as I know, we had no more cases until 1924 when a case occurred in East Hampton Consulta tion with Surgeon-General Kirk, Sergei Bersukoff from Russia, who had had extensive experience with typhus, and others brought forth different oninions.

A Weil-Felix test was positive

I have reported 18 cases since 1912, 3 before 1916 when the Weil-Felix test was first used for diagnosis Since that time there have been positive reactions in all cases except one in which the patient died before the blood could be collected. The first case I reported to the New York State Department of Health was in 1933, that of M D of Montauk The State Department did not require this disease to be reported until later

The cases I have seen have shown pronounced toxemia as in a severe case of influenza, with eyes injected, great restlessness, severe headache, hyper sensitivity to touch, chills or chilly sensations, and muscular soreness Most of my cases did have some rigidity of the neck, and this is where I differ from Dr Davis, and most of them at some time during the illness did have an enlargement of the spleen The rash was as he describes Although I questioned its beginning on any other part of the body than the extremities, in reviewing some of my old charts I found that one definitely had it on the body first In regard to necrosis, 1 case did have definite necrosis and blebs as big as a thumbnail, just before the patient died

The serum treatment has seemed very satisfactory when given early In 1 case in which we thought the patient was going to die, with a temperature of 107 F, the serum was given intravenously and the next morning the patient was better As far as this new drug, para-aminobenzoic acid, is concerned, I don't know anything about it In my total cases, one child and five adults died, making six deaths out of the 18 cases, so the mortality in my experience was fairly high

#### THE EPIDEMIOLOGY OF ROCKY MOUNTAIN SPOTTED FEVER\*

NORMAN H TOPPING M D Bethesda, Maryland

(From the Division of Infectious Diseases United States Public Health Service)

THE epidemiology of Rocky Mountain spotted fever is so intimately associated with the blology of the tick that transmits the disease that I think it is appropriate to review the life history of the tick

There are three proved vectors of Rocky Mountain spotted fever in the United States Derma centor andersoni, which has been known as a vector since Ricketts work in the early 1900 s Until 1930, it was thought that Rocky Mountain spotted fever occurred only in the West. In 1930 Dyer Badger, and Rumreich in Washington. DC actually isolated the virus from nationts and from the D variabilis, or the so-called brown dog tick of the East and proved that Rocky Mountain spotted fever was in this locality About two years ago Parker and some of his associates proved that the tick Amblyomma americanum is also a vector along the Gulf coast of the United States There are many potential vectors, for example Rhipicephalus sanguineus the so-called kennel tick is a perfectly good vector in the laboratory but it has never been proved that it is infected in nature

The two ticks in which we are particularly in terested D anderson; which is the common vector in the West and D variabilis in the East have a complicated life cycle. Male and female feed on one of the larger mammals such as the dog cattle, or deer and during feeding they copulate. The female is fertilized and the male dies The female drops off after ten days and lays from 3 000 to 6 000 eggs. These hatch into larvae after a few days They are very tiny and feed on small rodents, field nuce rabbits, etc. They then moult into nymphs and again feed on small rodents The nymphs or the adults ' overwinter, and the following season they feed again on mammals and so the cycle continues

The interesting part about the life cycle of the tick is the fact that if the female is infected she passes the virus on to her eggs it is then passed through to the larvae and the nymphs and back to the adult so that the virus of Rocky Mountain spotted fever can be propagated by transovarial transmission. Thus, the ticks can serve not only as vectors but as reservoirs. Actual proof of animal reservoirs in small mammals has never been established although many have tried. In our simple philosophy of biology it seems that a

\* No formal paper presented. This represents notes taken during extemporaneous t. ik.

reservoir is unnecessary when it is known that the tick is perfectly capable of transmitting the disease from generation to generation transovarially

In humans the endemology follows the biology of the tick The season of greatest provalence is that in which the ticks are most abundant in any given locality usually starting in April and continuing until some time after August or Septem ber depending on the humidity and temperature The usual peak of Rocky Mountain spotted fever as we see it in Washington, D.C., Maryland and Virginia is about the last week in June and the first week in July There is a gradual progression. until June or July and then a gradual falling off until about August 1 or 15 after which the disease becomes rather rare. A case which was acquired by tick bite was reported in Virginia in December but that was during an extremely mild fall with no early frosts.

Geographically Rocky Mountain spotted fever is now located throughout the United States All of the states with the exception of five three of the New England States, Michigan, and Wisconsin have reported cases contracted within their borders. Each year there seem to be an increasing number of cases reported but we all feel that this is not a true increase in number but rather an increase in recognition of the disease since doctors are becoming more familiar with it. Each year an additional county is put on our spot map. Even though the first reported case was in the 1030 s it probably existed in the locality for many years before that

The disease is acquired where ticks are contacted People on the streets of New York City do not contract Rocky Mountain spotted fever On Long Island they do get the disease because they contact ticks. A simple example of the epidemiology of Rocky Mountain spotted fever could be given if we had a sufficient number of cases in golfers. I am sure we could correlate the incidence of spotted fever with the quality of the golf The good golfer would not contract Rocky Mountain spotted fever but the poor golfer would because the better the golfer the more he sticks to the fairway and the poorer the golfer the more he is in the rough such as Washington where we see a considerable number of cases of Rocky Mountain spotted fever each year it has always been observed that the case usually occurs in the house at the end of the street, where bushes and underbrush are close by

It is also a disease we where the children play see in people engaging in recreation

The morbidity and mortality in Rocky Moun-In the whole United tain spotted fever vary States, there are only 500 or 600 cases each year Of these, the gross fatality rate, considering all ages, runs about 20 per cent However, in the West the mortality is higher than in the East The question comes up as to whether we have had actual importation of Rocky Mountain spotted One way it could be accomfever from the West plished would be by importing the tick, D ander-The eastern tick is D variabilis extensive studies have been made trying to find D andersom in the East, but it has never been Therefore, the chances of importation of Rocky Mountain spotted fever from the West seem rather remote If it were actually imported from the West, we should see more or less of a string of known cases along lines of com-We would expect to find cases of munication spotted fever along railroad tracks or highways A pediatrician in Wash-This has not occurred ington, after seeing cases of Rocky Mountain spotted fever in children, said "This disease has been here for many years, but we have always called it black measles"

I believe that perhaps Rocky Mountain spotted fever has been here for many years, probably masquerading under all sorts of diagnoses

The question of East and West in Rocky Mountain spotted fever is one of considerable interest It is always said that the disease in the West is severe and here in the East relatively mild also said that the strains isolated in the West are severe strains, while those from the East are mild A few years ago we had occasion to isolate some 19 or 20 strains of Rocky Mountain spotted fever in the East and found both mild and severe strains, some just as severe as those in the West Several years after that we did the same thing in the West and found the strains to be both mild and severe So, as far as the strains are concerned, we could find no difference between the East and West To carry that on a little further. we examined statistics for the states of Maryland and Virginia for ten years, as compared with Montana and Idaho When statistics for those states were broken down by age, we found practically no difference In children below the age of twelve, in both localities, the fatality rate was 12 per cent, between the ages of twelve and thirty-nine, it was 15 per cent In adults above the age of forty there was a mortality of 40 per cent

How, then, do we evplain the difference between the 28 per cent gross mortality in the West and 19 per cent in the East? We found that over 50 per cent of cases in the East occurred in children below the age of twelve, and most cases in the West occurred in adult men above the age of The difference in the age distribution is a very simple explanation of the apparent increase in the fatality rate in the West as compared with Rocky Mountain spotted fever is a recreational disease in the East, occurring chiefly in children playing in tick-infested areas. In adults it occurs chiefly among golfers and fishermen, and others seeking recreation In the West it is an occupational disease among shepherds, woodsmen, and hunters There, women and children do not have the same contact with the wood tick as they do with the dog tick in the East There is no difference clinically in Eastern and

Western Rocky Mountain spotted fever Walter Reed Hospital, cases from the East and West were practically identical clinically The question comes up of dogs, and at this

point I feel a little embarrassed talking about dogs and Rocky Mountain spotted fever, because it was in this community that the first such observations were made Dr Krech contacted us in 1943, along with certain members of the County and State health departments, and we came up to see one of Dr Krech's neighbors had a Doberman pinscher dog which had lived in New York City and had never come into contact with ticks before Several weeks after coming here, the dog became acutely ill, and a diagnosis of streptococcus throat was made The dog had a temperature of 105 F, was not eating well, and was coughing It was given sulfanilamide weeks later the owner became ill with a typical case of Rocky Mountain spotted fever, and in studying the serologic reactions we found that the dog's complement fixation test was extremely high, and the owner of the dog also had a positive Following up this complement fixation reaction lead, we conducted several surveys on Long Island and found if we took dogs from families in which Rocky Mountain spotted fever had occurred, we obtained an unusually high titer from the dogs

In dogs selected from regions where there was no Rocky Mountain spotted fever, we found a low incidence of positive complement fixa tion reactions In Chicago and Los Angeles, where there is very little Rocky Mountain spotted Sera from fever, all the dog sera were negative the East where there is Rocky Mountain spotted fever were both positive and negative, but the highest incidence of positive reactions was from the dogs selected from families which had a case of Rocky Mountain spotted fever lead us to suspect that the dog has a more inti mate part in the epidemiology of Rocky Mountain spotted fever than previously has been con sidered

We know that the feces of the tick are highly infective We know also that the celome cavity containing freshly ingested blood is highly infectious We know that the organism of Rocky Mountain spotted fover can certainly penetrate the unbroken skin of an animal, and also infect through inhalation, as in other rickottsual disease We, therefore, could postulate that the feces of the tick that is feeding on a dog may get on the fingers of the owner through potting or, through potting the dog be dispersed into the air and be inhaled, or get into the conjunctival sac. Therefore, it is not at all impossible that the dog may be a great source of danger to its owner.

This summer we had occasion in Washington to see a patient with a suspected case of Rocky Mountain spotted fever who had been suck only two or three days, too early for positive scrologic reactions or for the appearance of the msh But the family dog was bled, and the titer of its serum was found to be extremely high Therefore, we treated the patient for Rocky Mountain spotted

fover which it was actually proved to be several days later Perhaps it was a coincidence, but it is surely at least interesting enough to warrant considerably more work.

Dogs are susceptible to Rocky Mountain spotted fever Badger in 1934 inoculated dogs in the laboratory and could recover virus up to ten days after inoculation. He found that dogs hying in a locality where Rocky Mountain spotted fover was provident were not susceptible but young dogs who had not had contact with the disease were susceptible and developed fever lack of pep, listlessness and cough and one of the clinical features of Rocky Mountain spotted fever in humans is frequently a dry, nonproductive cough

Our experience in this community has been a very valuable one Whether the dog will prove to be as intimately connected with Rocky Mountain spotted fever, as we now suspect, remains to be seen and Long Island is an excellent place in which to continue studies of that sort

#### DIAGNOSTIC AIDS IN ROCKY MOUNTAIN SPOTTED FEVER

GERALD R Cox. Sc D .\* Pearl River New York

THE preparation and use of diagnostic antigens have not been my special field of endeavor, but I shall try to give you a few ideas as to the value and use of certain laboratory aids in the diagnosis of Rocky Mountain spotted fever

When human beings become sick with a disease characterized by a rash and high fever and the cases develop in tick infested areas where only Rocky Mountain spotted fever is known to occur then it is relatively simple on epidemiologic grounds alone to exclude other ricketteral dis-Thus, in certain areas of the United States, such as Long Island and the Rocky Moun taur area of the West where endemic typhus does not occur or is an extreme rarity when a person develops an illness characterized by high fever and a rash it is naturally thought that the patient must have Rocky Mountain spotted fever those areas where both endemic typhus and Rocky Mountain spotted fever occur, such as along the eastern seaboard in Maryland Virginia, North and South Carolina, Georgia, Alabama, and Texas, the problem of dugnosis becomes more difficult. In addition, we have come to be aware of another nekettsial disease, "Q fever, which may also be transmitted by ticks and which has been shown to be the causative agent in two recent outbreaks of infection in stockyard and packing house workers in Amarillo Texas, and Chicago Illinois, respectively Thus, it is apparent that it has become necessary to develop reliable laboratory methods for the differential diagnosis of various rickettsail infections

#### Chnical Diagnosis

As the other speakers have mentioned, one of the distinguishing clinical features of Rooky Mountain spotted fever is the fact that the disease most often produces a rash that appears first on the extremities and then extends centripically to the trunk, whereas in the case of epi demic or murine typhus, the rash usually appears first on the trunk and then spreads centrifugally to the extremities. Thus far, no distinctive rash has been observed in Q fever

#### Laboratory Diagnosis

The Weil Felix test, based upon the production by certain of the pathogenic rickettsiae of non specific agglutinins against the 'O' nonmotile variant of certain Proteus strains, has been of value in helping to differentiate certain rickettsial infections from nonnecestical infections. The positive agglutination of OX strains of Proteus in most instances indicates that the disease is rickettsial in nature. The three type strains of

Director of Viral and Rickettsial Research, Lederie Laboratories Division, American Oyanamid Company

Proteus in general use for the Weil-Felix test are the OX 19, OX 2, and OXK—It is not possible to differentiate between epidemic typhus, murine typhus, and Rocky Mountain spotted fever by using the Weil-Felix test, since all three of these diseases may produce agglutinins to OX 19 in high titer.

Rocky Mountain spotted fever cases may produce high titer agglutinins against OX 2, but this test cannot be relied upon as an absolute diagnosis. Scrub typhus cases as a rule show agglutinins against OXK, and such reactions are usually interpreted as of diagnostic significance. The sera from "Q" fever cases do not contain agglutinins for any of the known OX strains of Proteus.

In recent years, following the discovery that rickettsiae could be grown readily in the yolk sac tissue of a fertile hen's egg, or on agar tissue cultures, it has been possible to prepare washed rickettsial suspensions of sufficient purity to use in agglutination tests

The agglutination tests are truly specific and readily differentiate between the various types of rickettsial infections, but the preparation of purified rickettsial suspensions for such tests is both laborious and expensive, and most laboratories cannot afford to employ them

On the other hand, numerous investigators now have shown that specific differentiation may be obtained with the complement fixation test by using antigens prepared from rickettsiae grown in the yolk sac tissue of fertile hens' eggs on agar tissue cultures or in the lungs of infected animals. Complement fixing soluble antigens are more readily prepared than are purified suspensions of nickettsiae for agglutination tests and the results obtained are quite specific and reliable

The test employed is essentially the Kolmer and Boerner technic used for syphilitic tests, in which a greater sensitivity is secured by storing the mixtures of serum, antigen, and complement overnight in a refrigerator before adding the hemolytic serum. Recently it has been found in our laboratory that soluble antigens of greater purity and specificity can be prepared by extracting them with benzene and then concentrating them by sodium sulfate precipitation.

Such purified antigens possess the distinct advantage of not giving false positive reactions in the presence of syphilitic or malarial serums, whereas nonpurified antigens quite often yield false positive reactions

In conclusion, the complement fixation reaction is without doubt a more reliable method for determining past infection with spotted fever or other nickettsial infections than is the Weil-Felix test,

since complement-fixing antibodies may persist in significant amounts for ten years or more after illness, whereas the Weil-Felix test becomes negative in less than a year following infection. However, it should be pointed out that the complement fixation test as used at present is not entirely satisfactory for diagnostic purposes, since complement-fixing antibodies do not appear in significant titers until the eighth to tenth day after onset of illness, and thus much valuable time may be lost before a positive diagnosis can be made.

Studies are now in progress in a number of laboratories, aimed at correcting this serious handicap in our present diagnostic methods, and it is hoped that success will be achieved along these lines in the very near future.

#### Discussion

Dr Franklin M Hanger —Rickettsial parasitism is widely dispersed in nature, where it is especially prevalent among the arthropods. In some instances, such as the one under discussion, the agent of spotted fever is so efficiently adapted to the infested host that no disability is caused to the tick transmitting the disease. Man is but an incidental participant in the life cycle of this interesting group of micro-organisms.

Dr Cox has played an important part in developing laboratory methods for distinguishing various rickettsial infections, such as spotted fever, from certain forms of typhus It was he who devised methods for cultivating the various micro-organisms in the yolk sac and obtaining specific antigens in sufficient quantities for satisfactory complement fixation tests and other immune reactions calities where only one of the rickettsial infections prevails the diagnosis may be assumed with reasonable assurance, but in certain regions, such as in some of the southern states, or in New York City, various types of rickettsial disease coexist and can be differentiated positively only by serologic tests Many longstanding controversies, such as the rela tionship of Brill's disease to epidemic typhus, or the specificity of Western and Eastern spotted fever, at last can be settled satisfactorily by these meth ods

From a clinical standpoint, prompt diagnosis is important, since serum therapy and para-aminobenzoic acid are most effective when administered early in the disease Unfortunately, laboratory aids such as the Weil-Felix and specific immune reactions appear too late to be of great practical assistance. Physicians in regions where spotted fever is endemic constantly must bear in mind the possibility of this disease and examine carefully all febrile cases during the tick season for rash and other distinguishing features of the disorder. We must still depend upon clinical acumen for the recognition and effective management of this disease.

#### VACCINE PROPHYLAXIS OF ROCKY MOUNTAIN SPOTTED FEVER\*

CHARLES C SHEPARD M D, \*\* Bethesda, Maryland

R OCK1 MOUNTAIN spotted fever vaccine is prepared by two mothods. The older method, developed by Spencer and Parker uses ticks infected by feeding on infected animals. The other method is based on the observation by Cox that abundant growth of the organism of Rocky Mountain spotted fever may be obtained in the yolk sars of fertile hear' eggs.

The processing of this vaccine is the same as that developed for typhus vaccine by Topping as a modification of a method suggested by Craigie

The reactions to these vaccines depend principally upon the impurities present in them namely, tick or yolk sae material. The more frequent reactions for each type of vaccine are sunilar to that observed after typhoid vaccination with local soreness and swelling and if severe some constitutional reaction. Occasionally on repeated doses of tick vaccine, increased reaction with considerable edema is observed.

Data on reactions to the yolk sac vaccine may be obtained from the administration of typhus vaccine to some millions of troops during the war-In these men, one death with anaphylactoid symptoms occurred in a man with definite history of sensitivity to eggs and chickens Several other severe reactions with similar symptoms were also seen and these again in men with histones of sensitivity to eggs and chickens. One death following the administration of Rocky Mountain spotted fever vaccine has also occurred this in a child under treatment for sensitivity to eggs, among other things. Thus it would seem that these severe anaphylactoid reactions could be prevented by taking a short history and when this discloses sensitivity either administering tick vaccine or avoiding vaccination altozetber

As for efficacy, it would seem that tick and yolk sac vaccine are equally potent. Its ability to prevent death was fairly well demonstrated in the laboratory where before vaccine, laboratory infections were nearly always fatal, and where since vaccine has been used cases have been mild and almost uniformly nonfatal

Data from the field are difficult to collect but

everyone seems agreed that cases tend to be prevented by the vaccine, and when they do occur they are much modified

The question about vaccine most frequently rused is to whom should it be given? First of all we may say that laboratory personnel working with the agent should be well vaccinated before they start. Others for whom vaccination should be considered are persons subjected to heavy tick exposure. This group includes those whose occupations cause them to go frequently into tick infested areas and it also includes those whose play and recreation entail exposure to ticks.

What is a heavy enough exposure to make vac condition necessary is not too easy to answer However at the two extremes are those who get only two or three ticks a season who would probably not need it and those who find ticks on themselves each day for whom it night be recommended

Another group for whom vaccino can be con sidered is the owners of dogs that range in tick areas. It would seem that the owners of those dogs which frequently pick up ticks should receive the protection of vaccine.

The best time to administer the vaccine is about a month before the expected exposure. Its dosage is perhaps best in three injections of 1 cc each a week apart, although two injections of 2 cc each have also been recommended

A question which frequently arises is whether a person already bitten by a tick should be vaccinated. Vaccine given at that time would probably not give much protection against that tick bits since the incubation period of the disease is so short.

However vaccine given then would afford protection for future tick attachments which frequently can be expected

When a person has been well vaccinated, the repeat dose the following year can probably be cut to one injection

It should be emphasized that vaccination does not render unnecessary the usually recommended directions for personal hygiene. These include avoidance of tick areas whenever possible a thor ough personal inspection for ticks after exposure, and constant watching for ticks while in tick infested areas.

# PATHOLOGIC CHANGES IN ROCKY MOUNTAIN SPOTTED FEVER

WALTER W BRANDES, M D ,\* Southampton, New York

(From the Southampton Hospital)

THE gross lesions in Rocky Mountain spotted L fever in most cases are neither striking nor characteristic A macular rash, appearing first on the wrists and ankles and later extending to the trunk and face, has been described hemorrhages are usually seen in the skin and serous membranes Scrotal swelling and, at times, gangrene of the tonsils may be encountered in the more chronic cases The viscera reveal the cloudy swelling which is seen in any disease accompanied by high fever A mild to moderate enlargement of the spleen may be present. The meninges may appear normal, or they may show mild edema and hyperemia

The histologic changes are fundamentally those of an acute, specific, infectious endangutis, with swelling and proliferation of the endothelial cells Necrosis and thrombosis then occur in the small The specific characteristic of the lesions is the presence of the inclusion bodies described by Ricketts 1 The rickettsial bodies can be demonstrated within the endothelial cells smaller vessels-capillaries, arterioles, and venules-are affected Swelling of the cells leads to narrowing of the lumina, and necrosis of the wall results in small hemorrhages of the petechial The thrombi are formed from necrotic endothelial cells, fibrin, and red cells stages of the rash are produced by stasis in the capillaries due to the narrowing and occlusion of the small vessels The later hemorrhagic character is due to necrosis with capillary hemorrhage Varying degrees of perivascular infiltration of lymphocytes and larger monocytes are seen around the vascular lesions

The above changes have been observed in practically all organs, but especially in the testicles, tonsils, skin, and brain They have been described in the myocardium, kidneys, spleen. liver, and in sympathetic ganglia

The nckettsial bodies have been demonstrated in the endothelial cells, stained with Giemsa's method, by Wolbach 2 They are pleomorphic in character, occurring chiefly as minute diplococcus-like bodies in the endothelial cells of the vascular endothelium, but, also, in smooth muscle fibers and detached endothelial cells bodies have been found by Conner in the blood and in cell-free plasma after prolonged centrifug-They have the appearance of pleomorphic They may be bacıllary, lanceolate, or bacteria

diplobacillary, and some have flat ends joined by nonstaining material The free ends are more pointed than those of pneumococci Solid-staining or one or two chromatoid bodies may be seen.

Lesions seen in the guinea pig are pronounced swelling and reddening of the scrotum and eyelids, ulcers of the paws also may be seen Rickettsia can usually be demonstrated in the scrotal tissue

Hassin<sup>8</sup> has described the lesions found in the human brain as a nonsuppurative meningo-encephalitis analogous to the type caused by typhus fever (Fig 1 on opposite page) The vascular lesions are similar to those seen in other organs (Fig 2) The cellular infiltration is monocytic The adjacent brain tissue reveals varying degrees of degeneration with accumulation of fat products resulting from degeneration The lesions are scattered throughout necrosis the brain

In the liver (Fig. 3), the lesions again reveal vascular damage, thrombosis, and cellular infiltration in the perivascular stroma of the portal Parenchymatous degeneration of the areas The lesions in the skin liver cells is present (Fig 4) are those of vascular damage and lymphocytic infiltration, and the myocardial lesions are of the same puttern

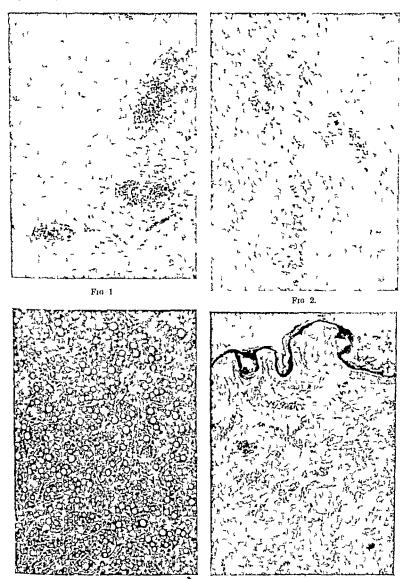

Fundamentally, the lesions are similar in na-Invasion of endothelial ture wherever found cells by the Rickettsia, endothelial swelling, narrowing of the lumen, stasis, thrombosis, necrosis, and hemorrhage, together with varying degrees of perivascular infiltration of lymphocytes and mononuclear cells are the fundamental changes seen Vascular occlusion results in ischemia which, in association with liberation of toxic products, leads to the production of the changes seen in the immediately surrounding tissue The seventy of the clinical picture depends upon the degree of involvement, or the number of such focal lesions present

# INSECT VECTORS OF ROCKY MOUNTAIN SPOTTED FEVER ON LONG ISLAND

JOHN K MILLER, M D, Albany, New York

(From the Division of Laboratories and Research, New York State Department of Health)

THE principal, if not the only vector of Rocky 1 Mountain spotted fever in the endemic focus of Long Island, is the American dog tick, Dermacentor variabilis (Say) The epidemiology of the disease thus depends largely upon the distribution, life cycle, ecology, and methods of control of this species It is for this reason that the Division of Laboratories and Research of the New York State Department of Health joined with the Science Service of the University of the State of New York in extending the study that was made by the State Entomologist on Long Island during the summer of 1945 1 The present discussion is a summary of our observations during the summer of 1946, and of reports of similar surveys in other parts of the country

In the Rocky Mountain region, the disease is transmitted by the wood tick, D andersoni Other potential vectors are the Pacific coast tick, D occidentalis Mary, and the Lone Star tick, Amblyomma americanum (L) ubiquitous rabbit tick, Haemaphysalis leporispalustris and the cajenne tick, A cajennesse, apparently at present confined in the United States to extreme southern Texas, have been found to transmit the disease to experimental animals and hence are also potential vectors The life cycles of the Rocky Mountain wood tick2 and of the American dog tick are similar Bishopp,<sup>3</sup> and Smith and his associates, have made extensive studies of the American dog tick, the latter having surveyed the islands off Cape Cod for a period of five years, 1938 to 1942 With few exceptions. our observations on Long Island this year parallel their findings, and I have drawn freely from their publications in this paper

The American dog tick is distributed widely in the United States eastward from the Rocky Mountains to the Atlantic coast and southward to the Gulf of Mexico and the Rio Grande, it is also found on the California littoral There is a tendency to concentration along coastal areas Within a given region there are spatial and seasonal variations in incidence, but certain zones of localiza-Ticks are most numerous along roads, tion exist paths, trails, and animal runs Mice captured at the very edge of a road have been found to be eight times as heavily infested with ticks as those trapped 200 feet back 4 Smith's studies indicate that the range of travel is limited and that the tendency is to remain in a small area throughout the senson There is random movement but the prevailing direction is toward the routes of mammalian travel, where the tick then remains However, even concrete roads are not a barrier to their movement

Tests indicate that the ticks are attracted by the scent of man and mammals. Wooden stakes handled by a person or rubbed on dogs became in fested with ticks, but none were found on unscented stakes or clothes. Apparently ticks do not willfully move toward bodies of fresh water and concentration in such areas is probably due to the presence of animals about water holes. There has been no demonstrated relation between the direction of movement by egg-bearing females and the position of mouse runs.

In considering the life cycle of the American dog tick, probably the most significant facts in relation to Rocky Mountain spotted fever are that the rickettsiae which are the causative agent of the disease are transmitted from generation to generation of ticks by infection of the eggs through the female, and that they are innocuous The next important fact is that to the ticks the ingestion of blood by the adult tick can result in an increase in the number and the virulence of the pathogenic rickettsiae—a "reactivation" of the agent which makes subsequent bites of a partly engorged adult more infectious than The life cycle of the the bite of an unfed tick American dog tick has four states with three host periods during which the tick obtains the blood meal so essential to its subsequent meta-The four stages are the egg, the morphoses larva, the nymph, and the adult

The Adult Tick—Under experimental conditions the adult may live more than two years without feeding. The maximum observed lon gevity is 1,032 days. The adults feed only on the blood of mammals. The dog is the principal host and man is only accidentally infested. Males feed and mate with one or more females intermittently on the host for indefinite periods. The females become engorged with blood in about ten days and then drop from the host to find a satisfactory hiding place in the grass. Depending on the temperature, the female begins to lay eggs in from six to sixty days after dropping.

Eggs—The eggs are laid in compact masses of 4,000 to 6,000 over a period of two to five weeks. After this the female usually dies within a few

days but may live for several weeks. The menbation period varies with the temperature, normally ranging from thirty six to sixty days. Extended incubation tends to shorten the life of the larvae eggs surviving a winter also yield shortlived larvae.

Larrae -The larvae may live for more than a year without a blood meal a maximum longeyity of five hundred and forty days has been noted by Smith 4 The larvae attracted by the odor concentrate along mouse runs and feed on the mice or on other small rodents remaining at tached for about four days Upon full engargement they seek a protected place in the grass in which to undergo their metainorphosis into nymphs Depending on the seasonal temperatures and moisture, the period from dropping to molting varies from ten to two hundred and fifty days In this climatic zone larval activity begins in March or April reaches a peak some time between March and June and then declines as the summer progresses. A secondary peak may occur in August or September and activity ceases in September or October of a normal year Larvae active before July have usually hatched the previous season, the late peaks are due to Lirvae hatched from eggs laid the same season

Numphs -The nymphs have been found to live five hundred and eighty four days without feed ing 4 The engorgement period is from three to eleven days and the period between dropping off the host and molting ranges from twenty four to two hundred and ninety-one days Nymphs molt the same season they engarge but only a few of the resulting adults are active that season Nymphal activity begins in March or April increases stendily until July or August then declines until cessation in September or October Nymphs active before June are those emerging from hibernation those active after June are derived from larvae molting the same season Lake the larvae they feed on small rodents espocially mice, and tend to concentrate along mouse runs

When the adults developing from the molting nymphs are ready to feed, they climb up on the grass or other vegetation and when approached by a possible host become agitated. They cling to the vegetation with their third pair of legs and wave the other legs about prepared to grasp any passing object.

Thus the completion of a life cycle of the American dog took varies with seasonal humidity light and temperature, and with the ability to find liests on which to feed. Temperature dominates the entire cycle affecting activity length of developmental periods and survival. High temperatures accelerate activity and reduce the de-

velopmental periods Smith found a close correlation between temperature and the time required for molting by larvae and nymphs oviposition period, and incubation period of the eggs. Unfed ticks in the early part of all stages are resistant to low temperatures, unfed larvae and nymphs will survive in a temperature of -4 F and adults survive in 0 F and can live through a winter En gorged larvae and nymphs are somewhat resistant to cold but eggs and engorged females are very susceptible Moisture is essential to survival at all stages Periods of drought interrupt hatch ing of eggs and the succeeding moltings are adversely affected by excessive precipitation only if submerged Engorged forms seem to survive immersion better than flat forms Engarged larvae and nymphs have survived five days' submersion in fresh water, larvae have survived one day in sea water and engorged nymphs three Smith found no correlation between rela tive humidity or precipitation and the tick activ ity and development. The seasonal light periods affect the immature stages of the tick. Long and increasing photoperiods are more favorable than short and decreasing ones Long field activity reduces the tick's vitality Very few adults are active more than one season under normal conditions

Hosts -The principal host of the adult tick is the dog but in the absence of dogs a wide variety of the larger mammals has been found to serve as host . On Lond Island we have observed adult American dog ticks attached to deer foxes skunks raccoons squirrels, chipmunks opossums and rabbits and on domestic animals such as the cow and horse. In the Rocky Mountain region and on the islands off Cape Cod the Der macentor larvae and nymphs feed principally on mendow mice. On Long Island however we find that white-footed mice are more frequently the Thus the food of ticks is the blood of mammals and tacks use the available hosts The larvae and nymphs utilize the smaller mam mals particularly small rodents but the adult ticks use these small mammals to a very limited extent. Hence an essential of the distribution of ticks is the joint presence of small rodents such as mice and the larger mammals such as dogs deer and domestic animals. The presence of these mammals in turn depends on the presence of proper and adequate vegetation which in turn is dependent on suitable soils and climatic condi

While birds have been found to be hosts of the rabbit tick, the role of the bird as a host of the American dog tick is not established but it is being extensively studied by us this season If the birds of the region were demonstrated to be

hosts of this tick, it would present a significant epidemiologic problem in migratory birds

Finally, I should like to discuss briefly methods of tick eradication The burning of vegetation will result in at least a temporary reduction in the number of ticks through their destruction and the dispersal of the small rodent population However, with the reappearance of vegetation both the rodents and the ticks will increase in Burning does have the value of destroying the mats of dead grass in which the larval and nymphal forms seek concealment control of the small rodent hosts by poisoning will reduce the incidence of ticks in the treated area during the season following the treatment In this region we have reason to suspect that removal of the principal host of larvae and nymphs would only result in the utilization of other mammalian hosts Eradication of the ticks by this method would destroy most of the local fauna and create a serious ecologic imbalance Smith found that the systematic treatment of all dogs in an area by dipping in solutions of insecticides substantially reduced the number of ticks in the area, but three years were required to achieve the maximum effect

The exact status of DDT in the control of ticks has not been established According to Bishopp. emulsions of 0 5 per cent DDT in a 2 5 per cent soluble pine oil sprayed over infested wooden areas at the rate of 1 to 3 pounds of DDT to the acre destroyed a large percentage of the various stages of ticks, including the American dog tick, the Lone Star tick, and the black-legged tick Ten per cent DDT dust in pyrophyllite applied to grassy areas also gave good results Glasgow and Collins¹ found that a number 2 fuel oil solution containing as little as 0.25 per cent DDT plus 0 0625 per cent pyrethrum and used at a rate equivalent to two quarts to the acre resulted in good control of the American dog tick under experimental conditions They are giving further study to this method DDT is less deterimental to the honey bee than lead arsenate 6 While five pounds of DDT per acre of forest land by airplane dispersion will cause great destruction of nesting birds which probably feed on the toxic insects, two pounds to the acre will not kill the Fish will be killed by concentrations of birds one-half pound to the acre However, there is some reason to believe that lesser concentrations than those harmful to birds and fish may be sufficient to control the American dog tick awaits the results of further studies by a number of investigators, including Dr R D Glasgow and Dr D L Collins of the New York State Science Service, who are studying the problem intensively on Long Island

#### Summary

Observations on the distribution, life cycle. ecology, and methods of control of the American dog tick indicate that the following factors can influence the epidemiology of Rocky Mountain spotted fever

The rickettsiae which are the causative agents of the disease are transmitted from generation to generation of ticks by infection of the eggs through the adult female, the rickettsiae are innocuous to the ticks While climatic conditions alter the length, character, and vitality of the various stages of the tick, there are stages which survive the low winter temperatures in this re-This resistance to cold, coupled with the heriditary transmission of the rickettsiae, results in the perpetuation of the disease from year to On the other hand, climatic conditions which lengthen the stages of development, particularly extended periods of incubation of eggs. tend to produce short-lived ticks

In order to undergo the necessary metamorphoses, the tick must find a mammalian host from which to obtain a blood meal. This results in concentrations of the tick along routes of mammalian travel The presence of mammalian hosts, in turn, depends on a terrain with suitable and adequate vegetation In a highly cultivated terrain the incidence of ticks is decreased, probably by the elimination of flora favorable for attachment of ticks, and to the dispersion of the small rodents and larger mammals which are the essential hosts

The ingestion of mammalian blood by the adult tick can result in an increase in number and virulence of the pathogenic rickettsiae which makes subsequent bites of a partly engorged tick more infectious than the bite of an unfed tick

The fact that the domestic dog is both the principal host of the adult tick and the intimate associate of man makes the possibility of exposure of persons to infected ticks greater than if the principal host were a less closely connected domestic host, or a wild animal

The control of ticks has met with limited success, but extensive preliminary studies with the insecticide, DDT, are promising

# THE STATE SCIENCE SERVICE AND THE SPOTTED FEVER PROBLEM ON LONG ISLAND

ROBERT D GLASGOW,\* Albany, New York

A S IS well known, there has been for many years an endemic focus of Rocky Mountain spotted fever in the eastern part of Long Island and the center of greatest intensity appears to have persisted in the town of East Hampton

The principal tick vector, Dermacentor variabilis, commonly known as the American dog tick or the Eastern wood tick, is also locally abundant in the eastern part of Long Island, and for this tick the areas of greatest abundance appear likewise to lie in the town of East Hampton

Recently, this tick and the spotted fever situation have become subjects of some newspaper publicity, and the general public both on Long Island itself and in the tributary metropolitan area has become increasingly tick conscious Apprised of the situation, officers of the Long Island State Park Commission at once became concerned about the apparently progressive increase in the incidence of spotted fever and the seeming westward extension of its range, as well as the attendant health hazard to the growing number of users of our Long Island system of State parkways, parks, camping areas, bathing beaches, and other recreation facilities Accordingly, Mr Henry Reppa, assistant general superintendent in charge of maintenance, asked in the summer of 1945 that entomologists of the State Science Serv ice undertake a study of the tick vector and its control They generously offered to place at our disposal laboratory space and living quarters for our scientific investigators considerable amounts of material and equipment, and the services of State Park Commission personnel as needed

Starting after the peak of the tick season had passed, with the assistance of Dr D L. Collins, of our Office of Entomology, we made a preliminary survey of the situation. We also carried out a sense of screening tests with known scancides, and with insectiones which seemed to have potential acancide value in order to find the most promising agents for intensive experimental use in 1948.

With the additional assistance of the Suffolk County Mosquito Control Commission, this project was expanded and technically rounded out in the spring of 1946 through arrangements for the active participation of the State Department of Health Division of Laboratories and Research Dr Gilbert Dalidorf then director of the Divi sion of Laboratories and Research, was much in terested in the Rocky Mountain spotted fover problem, and we were especially fortunate to have Dr John K. Miller of that Division ready to join us in a broad, ecologic study of the situation Again in 1946 as in 1945 laboratory space and living quarters for personnel were generously provided at Montauk Point by the Long Island State Park Commission. Special laboratory equipment including a refrigerator autoclave sterilizer centrifuge and laboratory tables with appropriate auxiliary instruments and equipment, and the services of an electrician and a plumber for their

installation were provided by the Division of

Laboratories and Research

Three men from the State Science Service and two men from the Division of Laboratories and Research have spent the spring and summer at the Montauk Point field laboratory, and other personnel from Albany have participated in the work from time to time. The Science Service personnel are working on the life history habits, host relations and possible control of the tick Dr Miller and his associates are using all available means for making a comprehensive survey to determine the incidence of spotted fever, both of recognized and of possible unrecog nized or subclinical cases in the human population and in various species of domestic animals and wildlife. These two lines of effort are being closely coordinated and integrated in such a man ner as to constitute a comprehensive, ecologic study of the tick and spotted fever complex.

This complex comprises the rickettsial pathogen the tick vector sources of food and of transportation for the various life stages of the tick acceptable and unacceptable alternate hosts of the pathogen, and the physical and other biologic factors of the general enviornment which together govern the epidemiology of the disease. The human element while of dominant importance from the human point of view is a relatively rare phase of a broader pattern

The problem presents many interesting angles Not the least of these is the fact that while the mammal infected with spotted fever dies or acquires permanent immunity upon recovery, the tick host which may acquire the rickettsial pathogen in any of its life stages remains infective throughout the remainder of its individual life Not only this but a female tick infected with Rickettsiae may pass the pathogen on through

<sup>\*</sup> State entomologist, New York State Science Service.

her eggs to her son and daughter ticks, and the daughter ticks in turn, without further source of infection such as taking blood from a mammal in the infective stage of the disease, may pass the pathogen on to still another generation of descendents from the originally infected female tick. Obviously, the tick and not the mammal is the continuing reservoir of the disease

With this relationship in mind, one might wonder why the entire tick population should not eventually become infected, and the disease eventually become more general than it now appears to be Among many other working hypotheses are the following

- 1 Perhaps the tick species is in some degree self-cleansing, with the rickettsial pathogen being passed on by infected ticks only to a portion of their descendants in each generation
- 2 Perhaps local intense epizootics may exhaust the supply of nonimmune mammals, and permit the pathogen to vanish locally, or to lose its virulence

Such hypotheses pose innumerable problems for experimental exploration

The spotted fever problem on Long Island dif-

fers materially from the corresponding problem: Montana, and apparently calls for a different In Montana, with its vast area an relatively sparse population, vaccination of a residents in the spotted fever area should provid a relatively simple and practical solution for th human phase of the tick and Rickettsia complex On Long Island, likewise, vaccination of perma nent residents should be equally effective an practical, though on a much larger scale, bu Long Island is also a recreation area for million of transient visitors from metropolitan New York and vaccination of these hordes of visitors would scarcely be possible, even if acceptable to them For this reason, it seems necessary in the case of Long Island to search further for practical mean of so changing the biologic balance as to reduc and hold the tick population at a point well below the danger level

This objective can be attained only through a better knowledge of the ecologic complex with which we are concerned. The elements of the pattern are the rickettsial pathogen, its tick vector, wild life generally, domestic animals, and fin ally, almost as a biologic accident but more and more urgently with increasing numbers, man

## PUBLIC HEALTH ASPECTS OF ROCKY MOUNTAIN SPOTTED FEVER

ARTHUR T DAVIS, MD, \* Riverhead, New York

What E HAVE now had some 94 cases of this disease in Suffolk County since 1912 Among these, we have had 17 deaths Each year for the last two we have had 11 cases Of the 11 cases so far this year (1946), we have had three deaths The year 1940 was the only one with no reported cases since the disease was first made reportable in 1933

Rocky Mountain spotted fever was endemic only in East Hampton between 1912 and 1934 There were no cases outside of East Hampton Township until after this time, but since then it has been reported from every town Huntington Town this year reported its first case. The disease has definitely travelled down through the South Fork, then center, westward on the North Fork and, finally, on the North Fork to the eastward.

\* Suffoil County health commissioner

We have all talked about the various means of preventing the disease—It is impossible to avoid infected areas, since it is not confined to rural areas alone—In the well-populated village of Port Jefferson there have been cases in two children who had not been out of their own yards—That is also true of several other villages, so staying away from a purticular area does not answer the problem—Second, it is said "wear suitable clothing."—Practically nobody binds his clothing around the wrists and ankles at the seashore—It is just foolishness to suggest it—Other speakers have stressed other means of prevention

I do think that a little more local education of the public would be valuable, especially if most of us would bring to individual patients the fact that they are liable to contract the disease People who are definitely going to work in the area

should be vaccinated

#### DISCUSSION OF THE SYMPOSIUM ON ROCKY MOUNTAIN SPOTTED FEVER

DR HAVEN EMERSON When Dr Brill gave us his clinical impression of the condition which at that time was not identified as being one of the rickettmal diseases it was a matter of perfectly thrilling excitement to the internant Bellevue Hospital The question arose in the New York City Health Department as to what to do when a case of Brill a disease was found. We hunted for the body louse and never found any Brill a disease occurred almost always in the households of well-to-do people who lived a life of immaculate cleanings in which you would never expect to find a body louse. But we had been taught that all diseases of the typhus variety were related to the body louse. We had the same expomence that Zineser did in Boston He had to get the police department to arrest a vagrant so he could obtain a louse for experimental purposes

Because of the lack of entomologic and epidemiologic information, we did all the unreasonable things that health departments are apt to do in the presence of epidemics just as we are doing now in the presence of poliomy chtis It is a misfortune to have it supposed that whenever a disease appears that is theoretically preventable we should do something drastic about it. It should be noted that the health department has only about four resources police authority technical services research, and education. I am interested to see the trend of the remarks today While we are waiting for the entomologists and research students to give us further proof of benefits from sanitary control of environment, we certainly should not use authority One would hate to see a health officer sufficiently bold to require the isolation of patients with Rocky Mountain spotted fever or quarantine of contacts. That is what I mean by exercise of authority Education is constantly and increasingly being availed of and I wonder if the entomologists and others realize how we hang onto their words as to the best thing to do with this disease on Long Island or elsewhere.

What is it that we are going to teach? One thing is inspection of the body periodically. Our children on the North Fork nirely come out of the woods after berry-picking without going into the salt water. I don't know how it matches up with entomologic knowledge, but ticks don't stay on very long in the salt water. There is a good deal of protestion I believe in the use of salt water as a part of the recreational regime which is traditional here on Long Island. I think it is valuable to know how long the tick will stay on a person in the course of a bathing experience in the creeks or bays.

I want to note particularly our interdependence on the childran. You will recall that we got our first intimation of endemic typhus from Dr Brill. Dr Edwards gave us another lead to better understanding of a typhus-like disease, and if you go back into the history of a good many disease of public health significance you realize that the first step toward progress was made by the acute observant clinician at the home bedside or in the heputal

There is a little pamphlet I would refer to which

may be useful to those who are responsible for public action and professional care of patients with communicable duseases. It is Reprint Number 1697 of the United States Public Health Service Reports 1945 sixth edition. It gives in the course of about one page the essential facts of each of some 82 communicable diseases. In spite of the difficulty caused by our changing habits of terminology they have tried to classify the type of infection under tack borne fica-borne louse-borne and mite-borne rick oftsial diseases with their appropriate popular names attached to them. That little pamphlet I believe about be in the hands of everyone interested in communicable disease.

For twenty years and more we have seen that every graduate of the College of Physicians and Surgeons has had it, and we have put it into the hands of all public health nurses. It is valuable not because it has new or strange information, but because it encourages uniformity in the practice of public health. New York State having been traditionally in the vanguard of liberalization of communicable disease control has often modified its practice prior to the publication of the succeeding editions of this little pamphlet.

I believe that public health will progress in this field as it has in others, practically entirely through the process of education and this symposium is just one of the best kind of educational experiences. What we have been exposed to today is one aspect of professional education. It is much more difficult to go out and talk to the laity about these technical matters. It should be realized that health departments are awaiting authoritative teaching from the entomologist, the laboratory student, and the epidemiologist.

DR. Franklin M. Hanger. The physicians of this community are to be commended for the realistic manner in which they are attacking the problems of spotted fever which is obviously ondemic in Eastern Long Island. The eradication of infected ticks seems a large and arduous enterprise and yot much has been learned from these authoritative discussions regarding the opidemiology and prophylaxis of the disease which will be most useful in reassuring and counseling local residents and visitors.

From the clinical standpoint it is important to remember that the chief lesions of spotted fever are in the vascular system. The cutaneous rash thrombotic manifestations, and dysfunction of various organs, such as the brain and myocardium, are probably due in large part to derangements of blood supply. Patients convalescing from this disease should be protected from excessive strain for many weeks, as the lumen of many vessels may be narrowed or occluded long after the acute symptoms have subsided.

One of the most interesting now facts that we have learned today is the proof of the existence of spotted fever in this locality among the dogs — This finding may revise our ideas of the opidemiology of this disorder especially in explaining infections in persons

with no history of tick bite. Careful investigations are necessary to determine if a human can acquire the disease directly from dogs. It is well known that laboratory workers have contracted rickettsial diseases from handling tissue cultures without an intermediate host. It is also known that diseases like psittacosis may be contracted readily from infected birds although they are rarely transmitted from human to human. The physicians who have ample opportunity to observe the natural course of the disease will no doubt ultimately clear up this most important aspect of the problem.

1598

Progress has also been made in the therapy of spot-The infection is self-limited and all supted fever portive measures should be instituted to conserve and prolong the energies of the patient until a sound immunity develops Adequate fluids are especially important and should be maintained in delinous and comatose patients by parenteral administra-Immune rabbit serum is now available and is indicated at any stage of spotted fever when toxemia Serum, however, is most effective is pronounced when administered early Para-aminobenzoic acid, when begun within the first few days of illness, offers considerable promise as a therapeutic agent not a cure, but if administered at two-hour intervals in 2-Gm doses, it seems to depress the fever level and decrease the toxic manifestations. Its beneficent action is said to depend upon a growth-inhibiting effect on the Rickettsia Only after extensive trial. however, can its true merits be evaluated

I should like to ask Dr Topping if he has seen permanent damage to the brain, heart, or other organs following spotted fever, and also whether he has observed a chronic form of this disease, and whether it predisposes to chronic vascular disease

DR REIDAR TRYGSTAD, Central Islip. Long Island There are certain points, perhaps, which have not been emphasized One is the children children the rash is frequently a papular rash from the very beginning and gives a characteristic feeling on stroking the skin Also, in our cases we have almost always palpated the spleen There is one problem that comes up, and it arose in 2 cases in Central Ishp How shall we make a diagnosis in elderly people who have a fulminating infection? They usually die before serologic studies are positive, or the I believe a biopsy of the skin, even rash appears though no definite rash is present, would give suggestive evidence One should do a splenic puncture and take a blood specimen and inoculate it into one or two male guinea pigs

Regarding Dr Topping's theory that our dogs are infected prior to a known outbreak, I think that should be looked into in all cases

As to the possibility that the disease has always been present in Suffolk County, we know definitely that in this County ten or fifteen years ago all cases were east of Shinnecock—Isn't it more likely, since the first case originated on Gardiner's Island, that the deer there, which previously were imported from the West, were infected, and that one deer swam across and presumably carried the disease into another territory? Local ticks became infected from

one of these imported vectors, and pet dogs subsequently caused more widespread dissemination

DR NORMAN H TOPPING Several questions have been asked The first was, why aren't all of the ticks infected? I neglected to say that of the 3,000 to 6,000 ticks that hatch from the eggs of an infected tick, not all are infected, and with each successive generation in the laboratory, fewer and fewer are infected Parker and others have found it necessary each year to re-establish the virus in the infected tick colony, because the ticks are not capable of infecting enough of their progeny

As to Dr Hanger's question about permanent damage, I have seen only one child with anything that looked permanent About the time of defervescence the child developed postencephalitis similar to that following measles, mumps, or severe virus The child had a blank stare, could not infections hear, and showed all the signs that go with a severe encephalitis The case has been followed for three years, and there has been complete recovery The child comes in every six months for a check-up In the literature, however, there have been several reports of a more or less Parkinsonian syndrome follow ing a severe case of Rocky Mountain spotted fever The more central nervous system symptoms there are during the acute illness, the greater is the chance of having some sequelae However, these are very

How can one make a diagnosis in an elderly patient with fulminating disease where death occurs before the appearance of the rash, or before positive serologic reactions can be obtained? The suggestion made is the one we usually follow, even after death. A small amount of blood can be withdrawn and inoculated into guinea pigs. It is not necessary to pass the infection to other animals. After twelve to fourteen days the guinea pigs can be bled, the serum separated, and complement fixation tests performed. In this way it can be determined whether or not the disease is Rocky Mountain spotted fever

As for the origin of spotted fever and whether it started in Gardiner's Island and then invaded the rest of Long Island, the question is of theoretic interest only, since it is endemic over most of the United States, and we are now getting such interest and knowledge among our practitioners that it is being recognized more and more each year

DR WOLF D SCHMIDT, Smithtown Branch, Long Island In view of the histologic findings, I am wondering whether anticoagulant therapy has any part in the treatment of spotted fever? Also, how long does a tick have to be attached to a person before it can be assumed to have transmitted the disease? Is there any time limit during which cauter ization would be effective in preventing the development of the disease?

DE FRANKLIN M HANGER I could only speculate on the question regarding anticongulant therapy As you know, the lesion of typhus is not unlike that of periarteritis nodosa. I think it is an interesting suggestion, especially for patients with thrombotic tendencies. The problem is whether, with arterits

July 15 19471

and a weak arterial wall, a hemorrhage might not be precipitated by anticoagulants.

DR. NORMAN H TOPPING In reply to the question about the length of time during which ticks must be attached in order to transmit the disease Rick etts who originally did the work, took two groups of guinea pigs, in one group he removed known in feeted feeding ticks at various times, in the other he left them on He reported that between ten and twenty hours of attachment, none of the guinea pigs came down with Rocky Mountain spotted fever After twenty hours or longer all of them did that time Parker and others have fed infected ticks on guinea pigs and noted the results Ricketts I think, was a little optimistic. The safe period it has been found, is somewhere between two and six hours. If the tick feeds longer than six hours the guinea pigs usually develop Rocky Mountain spotted The question of the reactivation of the virus has been brought up Several theorists question whether that is true. One of the theories which is certainly interesting at least is this It is known that the tick probably does not infect through the bite The mosquite has the mechanism to inject but ticks probably transmit the Rickettsia through their feces That also holds for the flea in mumne typhus and the lowe in epidemic typhus. When a tick is placed upon a guinea pig to feed it doesn t pass any feces for some time, usually six ten, or twelve hours This would explain why there is a latent period

Dr. HAVEN EMERSON Isn't that modified possibly by the way the tick is removed? If a tick which may not have begun to discharge feces is crushed during removal, isn t it likely that direct lafection through the skin may occur in a shorter period? I wonder if in the teaching of this, we falled to stress the necessity of gentleness and precision in

removing the tick

DR. NORMAN H TOPPING The contents of the colomic cavity are highly infectious and crushing the tick during removal is a definite danger

One method I have heard of is to put a little collodion on the tick, then they can t get oxygen and will become disengaged. Other methods employ household ammonia todino acctone other aburning eigarctic butt, etc. We say remove the tick treat as if there had been a splinter and wash with alcoholor soap and water.

Dr. James E. Perkins, Deputy Commissioner of Health Albany Can you toll me why we have so few ticks in Upstate New York proper? I think it is a fact, and seems to be confirmed by the geographic distribution of Rocky Mountain spotted fever and by the low prevalence of tularenia as well. I am curious to know whether Dr. Topping or Dr. Glasgow can offer any reason why there are so few ticks of any variety in Upstate New York proper

DR. ROBERT D. GLASGOW. That is one of the things we would like to know ourselves and hope to find out.

DR SHEFARD KRECH There is one phase of this problem that has not been touched upon, and that is the role of the veterinarans. Dr Pontick, of East Hampton has already been of great service in detecting cases in dogs which were thought to be possible

carriers of Rocky Mountain spotted fover and Dr Fischer veterinarian of Suffolk County has also shown a helpful interest. I believe that the medical profession should work more closely with the voterinarians and benefit by their more specialized ax perience. It is obvious that much work lies ahead particularly in the field of animal carriers as possible intermediate hosts.

DR. S BENEDICT FISCHER, DVM I have seen 5 or 6 cases in dogs without laboratory confirmation but I am certain in my mind of the diagnosis of

Rocky Mountain spotted fevor

DR. ALBERT PONTICK DVM We had a number of cases in dogs which have been called Rocky Mountain spotted fever but to date have not had any laboratory reports to confirm the diagnosis. The chain of symptoms has been very similar to that in humans. We shall have to wait until next year or the following for more complete reports, and possibly use a more refined test to aid us in this work.

QUESTION Would Dr Topping discuss insect

repellents for ticks?

DR NORMAN II TOPING There have been very interesting fields studies, one of which is being car ried on in Georgia using DDT in a rather limited area and they intend to continue it over a number of years making periodic tole counts to check the effect. I know as far as the dog tick is concerned DDT does not appear to repel ticks and, apparently does not repel adult ticks as far as the human is concerned.

Dimethylphthalate was found to be effective for the mite in the South Pacific where studies were undertaken in tsutsugamushi disease another rickettsial infection. As for repelling ticks on the human it is simple to make an omulsion of soap and dimethylphthalate so it will stay on even after several washings. The Department of Agriculture has carried on studies in soveral southern states. I am sure that within a few years we will have definite in formation on insect repellents in Rocky Mountain spotted fever because considerable study is being given to that problem.

On ETHEL TRIGETAD Wading River Long Island
One thing that has been mentioned in passing at this
meeting but not sufficiently emphasized is the enor
mous importance of educating the public and par
ticularly the importance of teaching the public to inspeet children for the presence of ticks on their
bodles. I think we doctors could do a great deal if
we would stress this point because the ticks do not
become infectious until they have been feeding for
several hours.

I would like to ask whether any of the speakers have had experience with hyperimmuse human serum. We had one case in Mather Memorial Hospital in a child who was practically moribund. We happened to have in town a woman who had had an attack of spotted fever the previous year she had been given a booster dose of vaccine about two weeks before because her son had an attack of spotted fever for which it was planned to use her as a donor However this was unnecessary as her son had a light attack. We gave the patient a transfusion of

blood from this woman in the ninth day of illness and the improvement was most striking. The child had been comatose, and within a few hours was asking for food. The temperature came down by crisis within twenty-four hours, and the child made a good recovery and went home within two weeks. The transfusion was given well along in the second week of illness, which had been diagnosed six days before

admission as measles The child was admitted four days after the rash appeared, and at the time of admission the tick was still actually on the child

DR FRANKLIN M HANGER It is seldom that one has fresh convalescent serum available for the treatment of spotted fever The results in this instance are so striking that it will surely prompt further trials

### THE CLOSED SHOP AND MONOPOLY IN MEDICINE

We said in our January issue that "failure properly to integrate the general practitioner in our scheme of things would seem to signify a bankrupt civilization". In so far as he cannot be affiliated in some way with our hospital centers of continued education and training he tends to go "underground." This situation is essentially unwholesome, the more so because the implications of such a problem are sedulously evaded, just as though it had no reality, meantime much hypocritical stress is laid upon the indispensability of the general practitioner

This situation has come about, we suppose, because formerly it was possible to care for many very ill persons in the home, in accordance with the general social pattern of things, now it is possible for many very ill persons to be cared for in hospitals—by diplomates, the general practitioner has not followed his patient into the "closed shop," he does not belong to the "union"

To what extent the size and number of our hospitals have been intentionally or unintentionally

limited in "scarcity economy" fashion is anyone's guess, in any case, society is now demanding more and larger hospitals. How do the unions expect to see them manned? It would seem that the diplomate monopolists are due for some surprises

Ironically enough, the beneficiaries of the medical closed shop are not, as a class, particularly sympathetic toward their counterparts in the labor movement Logically, they ought to be staunch supporters of their industrial brethren

The general practitioner will have to save himself, it manifestly won't be done for him, he will have to recapture the status enjoyed by his professional ancestors, for it is in him that the aristocratic tradition of medicine is best exemplified. Can the great figures who created medicine be imagined limiting themselves in plebeian fashion—like unto the factory hand who performs one function on the assembly line year after year? It is perhaps logical, after all, that the medical plebeians of today should be unionized in closed shops—Medical Times, May, 1947.

## ACCELERATED GROWTH IN STATE HOSPITAL POPULATION REPORTED

The upward trend in the population of the twenty-six mental institutions under the jurisdiction of the Department of Mental Hygiene has accelerated during the past year, Dr. Frederick MacCurdy, commissioner of mental hygiene, revealed in June. A preliminary survey of the figures reported as of March 31, 1947, by the department's twenty mental hospitals, five state schools for mental defectives, and Craig Colony for epileptics indicated that the population of these institutions had increased by 1,921 over the corresponding total at the close of the previous fiscal year "These figures," stated Dr. MacCurdy, "indicate that we must soon take measures to implement our extensive building program."

At the close of the fiscal year (March 31) the department's institutions were caring for a total of 105,210 patients, of these, 93,482 were in the institutions, 1,703 were in family care, and 10,025 were on convalescent status, said Dr McCurdy The patient population of the institutions increased by

1,521 during the year, while those on convalescent status increased by 364. There was an increase of thirty-six among those in family care.

thirty-six among those in family care

During the year there were 20,057 admissions (exclusive of transfers) to the twenty-six institutions administered by the Department of Mental Hygiene, an increase of 604 over the corresponding total for the previous fiscal year. Admissions to the state hospitals totaled 18,358, an increase of 578. Discharges from these institutions, exclusive of deaths and transfers, totaled 10,176 patients. It should be emphasized, said Dr. MacCurdy, that the increase in admissions to the state hospitals would have been somewhat greater, were it not for the fact that some veterans were admitted directly to the veterans' facilities.

The five state schools for mental defectives admitted 1,511 patients, exclusive of transfers, an increase of only fifty-one — Craig Colony for epileptics admitted 218, an increase of five over the total dur

ing the previous year

#### BENADRYL A TECHNIC FOR ITS ADMINISTRATION

HERMAN RRINGTEIN, M D and Thomas H McGavack, M D, New York City

(From the New 1 ork Medical College, Metropolitan Hospital Research Unit, Welfare Island)

A REVIDW of the literature concerning the use of benadry! (beta-dunethy laminoethy) benzhydryl ether hydrochlorde) as a chemother apeuto agent for the treatment of the allergic states indicates a great divergence of opinion as to its efficacy and the methods of administration. Thus it has been said that the drug is valueless, or that patients have refused to take their medication because of its disagreeable ande reactions. Among the reasons discovered for such statements we have found that the dosage prescribed has been inadequate, or that there has been fail ure to make necessary adjustments in the dose or the method of administration which would lessen or obviate untoward symptoms.

It is not the purpose here to claim that bena dryl is a panacea for all diseases associated with allergy. Our experiences with the 258 patients mentioned in Table 2 and others, however, have convinced us that it is one of the most promising preparations for the symptomatic relief of allergically related states. It is the present aim to outline a procedure for administering the medication which in our routine has been practical and gratifying, and which it is believed should be videly applicable.

There is sufficient evidence to show that bena dryl possesses powerful antihistamine properties, 1-4 as well as atropine-like and antiacetylcholine effects \*\*1.1\*\*—12 The drug exerts its antihistamine effects in a manner unlike any of the other known antihistamine agents in that it neither neutralizes nor prevents the formation of histamine in the body. There is reason to believe that it produces its effects by causing a block to histamine in the receptor of the shock organ involved.

Benadryl is mildly toxed but not cumulative it does produce unpleasant side reactions in at least half the patients taking the drug. These reactions consist of dryness of the mouth, drown ness, light headedness fatigue, blurring of vision and occasionally nausea and vomiting. The degree of discomfort will vary with the dose as well as the individual. However, tolerance for the drug appears to improve rapidly, so that the symptoms enumerated above frequently disappear within the first twenty four to forty-eight hours, even though the patient continues to take his medication. We have had to discontinue medication in only 5 patients because of these side reactions.

1

1

į!

7

The question of how much benadryl to pre-

scribe for any given patient is an individual one The desage necessary to produce symptomatic relief will differ for each subject and will often vary in the same individual from time to time For instance, symptomatic relief has resulted from as little as 50 mg a day, while in many instances we have had to merease the dose to as much as 600 mg daily An important factor also to be considered in determining dosage is the condition for which the medication is prescribed For example, we have found that, in general, lesser quantities of the drug are necessary in hay fever than in bronchial asthma There is no fixed rule which applies to all patients nor to any one condition in which benadryl is of fective

#### Procedure

For all adult patients a schedule is prepared in which the initial dose is 150 mg of benadry!\* daily apportioned as noted below. On each successive day the dose is increased by 50 mg until a maximum of 600 mg per day if necessary is reached (Table 1). Patients are told to take their medication after each meal and again before retiring for the night. The schedule is arranged so that the dose is increased progressively late in the day.

Every patient is instructed to stop increasing the dose as soon as symptomatic improvement begins, and to remain on his effective dose for a minum period of two weeks. At the end of that time medication is discontinued. If symptoms recur, the patient resumes treatment with 150 mg or less. If there is no relief with this dosage in one or two days he starts again with the previously effective dose.

### THE USE OF PENICILLIN IN SURGICAL INFECTIONS

A Note of Warning

JOHN H GARLOCK, MD, New York City

(From the Surgical Service of the Mt Sinai Hospital)

THERE is no need to stress the fact that with the advent of the new antibiotics there has been a great change in the therapy of infectious diseases. One need only witness the startling results of the antibiotic treatment of certain medical infections, such as cerebrospinal meningitis, gonococcal infections, bacterial endocarditis, etc., to realize that the prognosis and therapy of many medical infections and some surgical infections have undergone a profound alteration

Enough experience has accumulated since the release of penicilin for civilian use to permit an appraisal of its indications, efficacy, and short-comings in the treatment of many medical and surgical diseases. It is the purpose of this short note to call attention to the fact that the indiscriminate use of penicilin by the physician in the treatment of certain surgical infections may lead to disastrous results for the patient by reason of the fact that penicilin, by its effects, may mask the true progress of the pathologic state for which it is being given

During the past six or eight months. I have seen perhaps 12 or 14 patients who were being treated by the physician with penicillin for surgical infections in the hope that operation could be In every instance, without exception, the underlying pathologic process had progressed steadily, although clinically there seemed to be considerable abatement of the disease instances of acute appendicitis, penicillin had been administered for more than forty-eight At the time of consultation, each patient presented all the evidence of a perforated lesion with diffusing peritonitis, yet they did not seem to be as acutely ill as ordinarily is the case in this late stage of the disease The combination of clinical improvement, equivocal physical signs, and a perforated appendix with peritonitis at operation is indeed unusual and offers considerable food for thought Whether penicillin alters the number or virulency of certain organisms or changes the symbiotic relationships of certain groups of organisms concerned in the initiation of appendicitis is immaterial What is more important is that, in spite of these effects on bacteria, the pathologic process started by these organisms will progress to its natural conclusion, namely, impairment of circulation, localized gangrene of

the wall of the appendix, and perforation — I am sure other surgeons have had similar experiences. It seems to me that the physician who undertakes the treatment of appendicitis by antibiotic remedies assumes a grave responsibility and subjects his patient to the risk of serious complications. It should be emphasized that neither penicillin nor any other antibiotic can supplant surgery in the initial definitive treatment of acute appendications.

In this note I would like to call particular attention to the danger of penicillin therapy in the treatment of acute cholecystitis The majority of the patients already referred to belong in this category Each patient has followed an almost identical course. The physician was called on an average of twelve hours after the onset of pain Fever, frequently chills, some prostration, localized tenderness and rigidity, leukocytosis, and a previous histo - of gallbladder disease were evident in the majority of this group All these patients were in the late fifties or sixties Penicillin therapy was instituted soon after the first visit by the physician, usually in the dosage of 30,000 units every three hours During the succeeding two to four days, there was noted improvement in the patient's general condition, an appreciable subsidence of spontaneous pain, a definite fall in temperature, a decrease in the total leukocyte count, but usually an increase in the polymorphonuclear differential count, and, what is most important, a definite decrease in the area of right upper quadrant tenderness and rigidity above combination will lead the unwary physician to believe that the infectious process is subsiding and that operation will not be necessary That the contrary is more often true is demonstrated by the operative findings in each instance cited above

Every patient presented an acute cholecystitis, some with complete gangrene of the gallbladder, all with pericholecystic abscesses. In no instance was there a free perforation. In a recent case, I suggested penicillin therapy in order to observe carefully what would take place with the patient under observation in the hospital. The chinical course of this man, who was 69 years of age, was exactly as described above. Although the physical signs were minimal after four days of penicilin

therapy, the fever had subsided and the patient was completely free of pain, operation disclosed a perforated gallbladder with a walled-off pericholecystic absecs. Extraperationeal drainage of the gallbladder resulted in an uncomplicated recovery

I could cite many other examples of the ill advised use of penicilin for surgical infections which should have been accorded treatment on the basis of sound surgical principles comes to mind the case of a chronic subphrenic abscess of huge size treated for nineteen months by repeated aspirations and injections of peni cillin solution Simple extraperitorical incision and drainage resulted in recovery in three weeks Physicians lose sight of the fact that the nower antibiotics must be used as adjuvants to sound surgery, rather than as supplanters of surgical therapy It should be emphasized that penicillin frequently will mask the true pathologic course of a surgical infection and will full the physician and patient into a false state of security

In this respect we are in the same position as were the otologists when the sulfa drugs were being used for otitis media and mastolditis. The symptoms of the ensuing mastolditis were so ther oughly masked that an accurate clinical appraisal frequently was impossible. Operation usually disclosed a completely destroyed mastold process

I hope that the indiscriminate use of penicilin will not result in the telling of a story that went the rounds after the advent of sulfamilamide. It was said then of a famous hospital that if a patient did not recover after three days of sulfamilamide therapy following admission to the hospital, a history would be taken and a thorough physical examination performed

Note. Since this article was submitted for publication (October 1946) streptomycin has been added to our anti-blotic armanentarium. Whether the above romarks should include this remedy also, only further experience will tell. I am inclined to the view that streptomycin will fall into the same category as pentelliln. It will not replace surgical therapy where indicated

#### PIG BITE SPECIALIST

Esteemed Editor

For some time I have been intending to write you a letter about a big research problem I have been working on, but for some reason I have not been able to get time for it. This is the time of year that I have to give a lot of attention to my chickens, and I have to give a lot of attention to my chickens, and I have to give a lot of attention to my chickens, and I have to give a lot of attention to my chickens, and I have to give a lot of attention to me shot of the service of the s

sistants, or any kind of flunky to collect the data. (Data is a word for all the cases I have seen, and all the cases I could hear about this someone else has seen, but because I thought this all up by myself it is all called my data.) I have had some help from Ma who copied the Bibliography from some pamphlets that were left in my office by a detail man. Now when I tell you more about this research project you will see that it is very scientific and that I have a lot of controls. (A control is somebody I ddn't use my treatment on because he wouldn't stand for it.) And I have some percentages, a lot of percentages (I was always good at ciphenny), and these percentages have been corrected and the corrected percentages have been corrected until they prove just what I want them to prove. And I am going to have some graphs' just as soon as I find out how they make all those funny little tracks on the graph

paper
Now I will have to stop writing I wanted to tall
you all about this research problem but Mrs Bill
Huggins just called for me to come out to their
place right away Bill is still in the hospital and I
guess is doing right well, but the Missos says the
sow don't look so hot and they are pretty worned

about her

# USE OF FIBRIN FOAM IN GALLBLADDER FOSSA FOLLOWING CHOLECYSTECTOMY

Bernard J Ficarra, M D, and Joseph Lionello, M D, Brooklyn, New York (From the Surgical Service of Kings County Hospital and the Hospital of the Holy Family)

ON MANY occasions the surgeon is confronted with distressing bleeding from the gallbladder fossa following cholecystectomy. This is especially true in acute or subacute cholecystitis. A valuable aid in the controlling of this type of bleeding is fibrin foam.

We have employed fibrin foam following cholecystectomy in 24 patients From the use of this foam certain facts have been learned which we believe to be of value In 6 patients the fibrin foam was simply placed in the gallbladder fossa followed by a drain inserted in the routine fashion. It was noted that in these 6 cases there was an excessive serosanguineous exudate which persisted up to the time the drain was removed. This exudate, however, ceased within twentyfour hours following the removal of the drain

In 6 patients we sutured the fibrin foam into the gallbladder fossa and purposefully did not insert a drain. No unusual sequelae were noted in this group. In 18 patients the fibrin foam was sutured into the fossa and a routine digarette drain employed. From this latter group our greatest knowledge was obtained

It was found that if there is any evidence of bile-ozing, fibrin foam should not be employed because the foam increases bile-flow. In 3 patients the bile was golden-brown in color. It persisted for two weeks in 1 patient. The others continued to drain bile for ten and twelve days, respectively. At the time of operation bile-ozing was noted in the fossa but it was minimal. On many previous occasions, without employing fibrin foam, oozing of this type was never troublesome. From this group we have learned that the

TABLE I —RÉSUMÉ OF 24 CASES IN WHICH FIBRIN FOAM WAS EMPLOYED

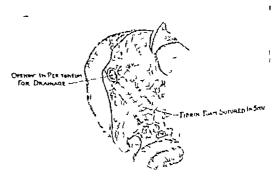

Num- ber of Cases	Pathology	Peri-	Drainage	End
2	Acute		•	Result
_	Cholecystitis	No	1 es	Excessive Sero sanguineous drainage
8	Subscute Cholecystitis	I es	2 No	Uncomplicated postoperative
14	Chronic Cholecystitis	les 4 No	les 4 No	Excessive bile cases

most satisfactory method is to suture the foam into the gallbladder fossa, leave a small opening at the top of the suture line, and insert a drain

In the last 9 patients upon whom a cholecystectomy was performed, this procedure was employed with the utmost satisfaction. On the seventh postoperative day the eigerette drain was removed, and a small sterile catheter inserted in its place for twenty-four hours or more. This enables the drain site to remain patent in the event that an additional accumulation of exudate needs to be eliminated. The catheter is a safety precaution, but it is not an imperative necessity

#### Summary

- 1 Fibrin form was placed in the gallbladder fossa to control bleeding following cholecystectomy in 24 patients
- 2 The ideal procedure is to suture the fibrin in the fossa, leave a small opening at the top of the suture line, and then insert a routine eigerette drain
- 3 It has been found that fibrin foam stimulates bile-flow Therefore, it is not recommended in the presence of bile-oozing
- 4 The proper use of fibrin foam to control slight to moderate bleeding from the fossa following cholecystectomy has been found useful on many occasions
- 5 It is appreciated that no hemostatic agent can supplant meticulous surgical technic which prevents unnecessary traumatic bleeding

Fro 1 Method of suturing fibrin foam in gall bladder fossa

The fibrin foam employed in this study was Celfoam fur nished by the Research Laboratories of the Upjobu Company Kalamazoo Michigan.

#### MULTIPLE PERITONEAL CYSTS SIMULATING CARCINOMA OF THE CECUM

JERE W LORD, JR , M D , New York City

(From the New 1 ork Post-Graduate Hospital)

I NAUCUST 1945 a 53-cear-old white woman was admitted to the heepital with the chief complaint of a right lower quadrant mass of one and one-half years duration. The mass had mereased insize only slightly amount it had first been observed. The patient also complained of fatiguability anomal, increased constipation and intermitten cramp-like pains located in the right lower quadrant of the abdomen. At intervals the stools had been dark in color but not black.

The relevant findings in the past history were first, a bilateral salpinio-copherectomy and supra cervical hysterectomy in 1935 for chronic pelvic in flammatory disease associated with a fibroid uturus second, a right nephropexy in 1938, third a total thyroidectomy for an adenoma of the thyroid in March 1915, and fourth an essential hypertension varying between 180/100 to 210/125 observed for

at least ten years

The physical examination revealed a woman appearing chronically ill with slight pulliness of the eyes and dryness of the akin. The blood pressure was 210/125. There was an well-healed thyroiden to make the composer without palpable thyroid tissue. The heart and lungs were unremarkable. The abdomen was not distended and was the site of well healed right flank and lower mulline scars. In the right lower quadrant there was a firm, slightly nodular movable, nontender mass measuring 12 by 5 cm. Public and rectal examinations were negative except for absence of the body of the uterus.

Laboratory Findings —The red blood count was 4,100 000, hemoglobin was 12.4 Gm white blood count 6 000 differential count normal Unn alysis was negative. The banum enema as reported by Dr William Meyer was Examination with contrast enema shows an imperfection in filling of the occum with an irregular nodular intrusion of its messal border, though small bud like extrusions are also noted in the lateral inferior aspect of the caput. There is also a partial fleoceal Incompetency with the mucosal pattern showing linear striations rather than the transverse valvulae connivent. There is also evident mass resistance about the size of an orange in the right like fosca, the picture suggesting a neoplastic infiltrative lesion with however is not sufficient to result in evidence of gaseous distention or the formation of fluid levels in the small intestine Conclusion Infiltrative lesion with partial stencess involving the caput of the cecum.' (Fig 1)

Acting on the diagnosis of caremoma of the escum, the abdomen was opened through a midright rectus incision on August 10, 1945. In the right lower quadrant the terminal ilcum, cocum, and ascending colon were enmeshed in adhesions and surrounded by innumerable spherical, translucent, thin-walled cysts varying from 1 to 8 cm. in diameter. The larger cysts pressed on the wall of the eccum, which was otherwiso normal. The stump of the cervix was palpated and the remaining viscers and port toncal surfaces elsewhere were normal. Three large cysts were shelled out and many others punctured. The abdomen was closed in layers by inter-

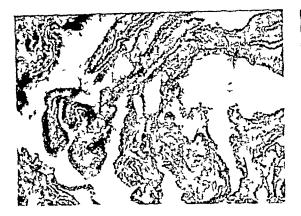

Fig 1 Barium enema, showing the legion of the cocum.

rupted sutures of cotton. Convalescence was uneventful and the patient was discharged from the hountal on the sighth postonerative day.

begins on the eighth postoperative day. Pubologist's Report—Gross Examination. The specimen consists of three monocular spheroidal cysts measuring 55 by 45 mm. 24 by 18 mm. and 14 by 9 mm. in respective diameters. They are of identical construction. They are filled with clear white serous material and have tissue paper thin translucent walls with a glistening internal surface, nowhere showing any thickening or papiliae. Microscopic Examination. Sections of the three

Microscopic Examination Sections of the three cysts show that they are of identical construction. Their wall is a thin lamella of finely fibrillar compact, or loose collagenous connective tissue lined internally a single orderly monocollular layer of either low cuboidal or flattened endothelioid cells. In the wall there are occasional robon-like cells with cylindreal nuclei suggesting the presence of smooth muscle cells. No proliferation or other features of a neophastic process are noted (Figs. 2 and 3)

Follow-up —The patient was placed on 2 grains of desicated thyroid extract daily which caused an elevation of her basal metabolic rate from minus 17 to minus 5 and to plus 5 over a period of four months. This metabolic change was accompanied by increased strength, a gain in appetite, and botter bowel function Examination of the abdomen revealed no

Photomicrograph showing the cyst wall in Fig 2 low magnification

mass or tenderness, the most recent check-up being one year postoperatively

#### Discussion

Dr Alfred Plaut, of the Beth Israel Hospital, was consulted and it was his opinion that the cysts, microscopically, were similar to the case he reported in 1928 1 Histogenetically, Plant favors the hinng cells of the peritoneum as the source of the cysts and, further, that the peritoneal lining is epithelial rather than endothelial in nature He called the lesion "benigh cystic serosaepithelioma of the peri-

In his discussion Plaut adds "all parts of the peritoneum have been found as the seat of the cysts, the omentum majus being the site of preference The disease is more frequent in children and in young persons, but it has been found ac-

Same as in Fig 2, in high-power magnifi Fig 3 cation

cidentally in old people at autopsy The majority of cases (perhaps from 70 to 75 per cent) occur in The condition may be congenital Sometimes new cysts form after operation. Some patients apparently are cured " Although the condition, multiple peritoneal cysts, is unusual, the case described in this paper apparently is the first one to be reported in which a carcinoma of the cecum was simulated both clinically and radiographically

#### Summary

A case of multiple peritoneal cysts in a 53-yearold white woman, clinically and radiographically simulating carcinoma of the cecum, is reported

55 EAST 92ND STREET

#### NEW ACTION ON E M I C PLAN ANNOUNCED

Recent action by the House of Representatives and by the Senate provides that the Emergency Maternity and Infant Care Program shall be in the process of liquidation on and after July 1, 1947, but, regardless of the date of application, all Emergency Matermity and Infant Care services will be provided to any woman or the offspring of any woman shown to have been eligible as of June 30, 1947 Thus the following services under the EMIC Program will be provided on and after July 1, 1947

The completion of all maternity and infant care for wives or infants for whom initial care was

authorized prior to June 30, 1947

Maternity care authorized after June 30, if the mother was eligible under the program as of June 30, 1947, even though she may apply for care subsequent to that date

Infant care authorized after June 30, 1947, if the mother or infant was eligible for care or received care under the program as of June 30, 1947 For example, if the wife of an enlisted man in the eligible pay grades became pregnant before June 30, 1947, she would be eligible to apply for and receive services under the EMIC Program until six weeks postpartum, and her infant would be eligible for service provided under the program until one year of age

#### CHRONIC RECURRENT SUPPURATIVE PANNICULITIS MIGRANS

ROBERT G LIVINGSTONE, M D Boston, Massachusetts

(From the Medical Department, Memorial Hospital New York)

A SYMPTOMATIC suppuration arising primarily within the subcutaneous tissues is a clinical entity of unusual occurrence which apparently has not been described previously. Note of the presumably sterile liquefaction of fat occasionally associated with Weber-Christian's relapsing februle nodu lar nonsuppurative panniculitis; has been recorded elsewhere,2 and abscess formation localizing in this site as a complication of obvious regional inflamma tory reaction or of recognized systemic disease has been a matter of common observation in many other instances. The recent discovery of a chronically recurrent migratory panniculitis marked by suppu ration and attributable to no determined causative factor is presented therefore, for further considera-

#### Case Report

A white woman of Polish descent, aged 21 years was first seen August 14, 1945, because of a localized painless swelling of about six weeks duration on the left thigh.

No events in the family history or in the past history, except for certain observations directly related to the immediate complaint, were found to be of notoworthy significance. About five years proviously a painless swelling as large as a man s hand had been discovered incidentally in the soft tissues of her lower back. Heat was applied locally by means of wet compresses, and spontaneous rupture of the swollen mass, occurring shortly afterwards, was attended by the discharge of a large amount of "yellow pus. The resulting sinus closed over promptly, and the area about the sear soon assumed its normal characteristics. Some time later a similar swelling appeared on the left lower leg, gradually interested. Increased in size, and then became quite soft. Treatment by diathermy was administered by the family physician with no apparent relief. Spon taneous rupture finally occurred, and complete healing of the area promptly followed. At various times thereafter comparable swellings were discovered in many areas of the body Payored sites, however seemed to be the scalp the back, the inframammary region, and the legs. Not infrequently certain swollen areas were seen to disappear without preliminary rupture, but no symptoms other than alight restriction of motion or occasional local tenderness of minimal degree were ever experienced.

Aid was sought from a number of physicians throughout the ensuing three-year period, and eventually at physical examination a diagnosis of cancer arming in the soft parts of the left thigh was clinically suggested Roentgen irradiation was accordingly administered to the area until desquamation occurred but permission for amputation at the hip which then was strongly recommended, was rejused Biopsy by excision from the area was afterwards per formed, but no definite opinion was said to have been offered at histologic examination of the specimen. Gradual regression of the swelling subsequently took place, and an interval of apparent freedom from discase, almost two years in duration intervened. Marriage followed, though pregnancy did not occur and the earlier reference to cancer was forgotten A recurrent painless swelling was then discovered on the back of the left thigh. As it increased in size an awakened fear of cancer quickly grew to certainty in her thoughts and she became exceedingly upeet, lost her desire for food entirely and no longer was able to sleep at night. A weight loss of almost 30 pounds occurred and she again sought hedical advice. At examination she was found to be a thin fairly

well-developed white woman, cooperative and free from pain but obviously distraught. Her weight was 90 pounds. The blood pressure in both arms was 100/60 Small well-bested drainage scars surrounded by a narrow zone of subcutaneous atrophy were present on the occipital area of the scalp in the left inframammary region and in several areas over the left upper and lower legs. A small soft node was palpable in the apex of the left axilla. On the pos-terior aspect of the left thigh overlying the junction of its upper and middle thirds, was a soft fluctuant, nontender mass about 10 cm long, 6 cm. wide and 2 cm thick. No other physical abnormalities could be found.

An aspiration blopsy of the mass was performed, and a large amount of thick, creamy red-brown liquid was obtained Immediate smears showed pus on microscopic examination, and subsequent pus on microscopie examinatori, and succedirent cultures yielded a pure growth of nonhemolytic Staphylococcus aureus Other laboratory studies disclosed a hemoglobin level of 62 per cent (8 6 6 m. per 100 cc.), a red cell count of 8 6 million, a white cell count of 5 6 thousand, and a sodimentation rate of 28 mm. per hour The differential white cell count of 50 millions of 50 mil count showed 82 per cent polymorphonuclear cells, 6 per cent moncoytes, and 14 per cent lymphocytes. The urine was normal except for a slight trace of albumin. Roentgenographic examination of the chest revealed no evident abnormalities.

Return to the family physician was advised, and the intramuscular administration of penicillin in does of 20 000 units every three hours for a period of two weeks was suggested. Therapeutic does of liver extract and of a multivitamin preparation were

recommended as supplementary measures

Contact with the patient was again established February 6 1946 at a follow-up examination Rapid improvement without drainage of the abscess had occurred under the course of treatment thus prescribed, and no recurrence of the swellings had been noted. A weight gain of 161/2 pounds in the A weight gain of 161/s pounds in the intervening six month period had been attained No physical abnormality other than a nontender area of subcutaneous atrophy measuring 11/2 cm in length 1 cm in width, and overlying the anterior aspect of the lower third of the right lower leg could be found. Laboratory examination of the blood disclosed a hemoglobin level of 87 per cent (12.0 Gm per 100 cc.) a red cell count of 4.8 million, and a white cell count of 18 0 thousand. The differential white cell count showed 80 per cent polymorphonu-clear cells 2 per cent cosinophilic cells 3 per cent monocytes, and 15 per cent lymphocytes. The urine was entirely normal. Tests for brucellosis and for infection by tubercle or the typhoid group of bacilli were negative.

#### Comment

The features thus described in this disease have not been recognized as manifestations of any other pathologic condition. Tuberculous "cold abscesses" have been characterized chincally by the chronicity of their course, by their prolonged healing phase, and by the associated findings of fever, leukocytosis, or evidence of focal or primary infection elsewhere. Most other diseases seem to be eliminated from consideration here by the absence of evident systemic manifestations or local inflammatory reactions. The gratifying clinical response achieved through recourse to penicillin administered in therapeutic doses, also observed in a recently reported case of

relapsing febrile nodular nonsuppurative pannicultis where penicillin was likewise utilized, may have been fortuitous or may have been the result of a specific action of this agent. For the present the descriptive term "chronic recurrent suppurative pannicultis migrans" is suggested for this clinical syndrome.

#### EPHRAIM McDOWELL AND OVARIOTOMY

The story of the first ovariotomy, performed in December, 1809, in Danville, Kentucky, is a familiar one to most Americans. We have read many times of the courage and endurance of Mrs. Crawford, the patient, and of the skill and daring of the surgeon, Ephraim McDowell. For twenty-five tense minutes, McDowell proceeded with an operation which he knew to be a hazardous experiment, he knew also that failure would probably result in the destruction of his professional reputation. With no precedents to guide him, with no aid from anesthesia or asepis, with none of the elaborate paraphernalia of the modern operating room, he depended solely upon his own cool judgment and his accurate knowledge of anatomy. Twenty-five days later, Mrs. Crawford returned to her home, able once more to resume her accustomed routine.

Of the many stories told about McDowell's history-making operation, those that describe an indignant mob gathered at the house at the time of the operation, those that say he performed the operation elsewhere than in his own surgery, those that represent him as seeking to be spectacular are decidedly apocryphal.

At the time of this famous operation, Ephraim McDowell, Virginia-born, Kentucky-bred, and Edinburgh-trained, had been in practice about fourteen years and was a respected member of his small community

His closest friends described him as a silent, phelgmatic man. His accomplishments grew, not from a desire for recognition or acclaim, but from the ingenuity, resourcefulness, and courageous attitude developed in him by long practice under the stern conditions of the frontier. He had derived inestimable inspiration, also, from the teachings of John Bell at Edinburgh, and it is interesting to note that both Bell and McDowell were made unhappy during the latter part of their lives by the small-mindedness and jealousy of their contemporaries and colleagues

It would seem that great achievements in medicine, such as McDowell's ovariotomy, frequently follow a definite pattern. A desire for achievement, the courage and energy necessary to perform a daring experiment, and inspiration, usually acquired from an outstanding preceptor. McDowell's teaching had been adequate, he possessed courage and ingenuity, and he proceeded with great deliberation to

perform his task. He was prevailed upon to report his first three cases, however, only by much persuasion and after a lapse of seven years. Such caution and deliberation are virtues in medicine, all too often neglected today.

McDowell's pioneering effort carned for him the title, "father of abdominal surgery" He was followed in America by other courageous men, such as Nathan Smith Goldsmith, and Rogers duction of anesthesia in 1846 initiated a second epoch in the history of ovariotomy, the operation was no longer a novelty, but a common proceeding Nevertheless, there continued to be long debates pro and The Atlee con, and not inconsiderable feuds brothers (1843-1883) of Philadelphia became the One of them. great proponents of ovariotomy Washington L Atlee, in spite of his skill and renown, was forced to deliver an address revealing the indignities to which he had been subjected by other surgeons One of his colleagues, on passing his house on Arch Street, said, "There lives the greatest quack in Philadelphia" Another remarked, "Tell Dr Atlee that I will not meet him in consultation because he undertakes to perform operations not recognized by the profession

In spite of such opposition the practice of performing ovariotomy continued to spread in the United States and abroad Cazeaux, in France, for six months had a battle on his hands in regard to the treatment of ovarian tumors, opposing him were such great names as Velpeau, Cloquet, and Trousseau Most of the German school favored the operation, but even a few distinguished German surgeons continued to speak of it as sheer murder Dr Emiliani of Bologna, Italy, may perhaps be credited with being the first European ovariotomist\* and second in the world to McDowell, in 1815 he removed an ovarian tumor 9 by 5 cm from a 26-year-old woman, a baker's wife of "lymphatic temperament" The patient survived not only the operation but also the blood-letting, tartar emetic, hemlock, and other remedies, and thereafter produced six children in undaunted succession!

## WERNICKE'S DISEASE REPORT OF CASE WITH RECOVERY AFTER FEVER OF 108 F

ARTHUR N FLEISS, M.D., Syracuse, New York

(From the Department of Psychiatry Syracuse University College of Medicine)

In 1881 Wernickel described what he called 'acute apportor hemorrhagio policencephalitir" and reported his 3 original cases. He considered the condition to be an acute inflammatory process similar to acute policiny clitis. The pathologic changes which he noted were focal petechial hemorrhages symmetrically located in the walls of the third ventricle, in the gray matter around the aqueduct of Sylvius, and in the gray matter of the floor of the fourth ventricle

Since that time a considerable number of such cases has been studied and it has been recognized that the lesions are not strictly inflammatory Gamper' in 1928 stated that the pathologic changes consist of a curiously selective distribution of focal lessons throughout the gray matter of the brain stem. These include hyperomia (at times with small homorrhages), vascular proliferation a vary ing degree of glial proliferation absence of inflamma tory infiltration, and relatively alight evidence of damage to the nerve cells. The lesions are localized in characteristic fashion most prominently in the mammillary bodies, less constantly in the other hypothalamic and thalamic nuclei. In the mid brain, the periaqueductal gray matter particularly the oculomotor nuclei, are involved and this gray matter destruction continues down into the floor of the fourth ventricle in the hind brain words, the lesions extend throughout the brain stem, though minor involvement has been noted in the cerebral cortex.

Of Wernicke s original 3 cases 2 were of chronic alcoholics. Throughout the years since then the association of this disease entity with alcoholism has been emphasized strongly On occasion alcohol has been considered the most important causative agent. In the past fifteen years, however more emphasis has been placed on the incidence of this ailment in nonalcoholic patients with the result that a far better understanding of the underlying metabolic disturbances has been reached. The general trend consequently has been away from the older assumption of direct toxic action by alcohol on nerve tissue, and more in favor of vitamin deficiency precipitated by many conditions including the chronic ingestion of alcohol. The vitamin deficiency may be due either to an inadequate diet, or to inadequate absorption associated with gastrointestinal difficulties or as is often the case in alcoholism to an increased vitamin need even in the presence of a balanced diet, as a result of the high calone value of the alcobol ingested.

Campbell and Biggart\* in 1939 described 12 cases of which only 1 was associated with alcoholism

Their patients ranged in uge from 31/1 to 68 years and suffered with gastric carenoma, chronic dyspepsia with gallstones, pernicious anemia anemia following bowel resection for tuberculosis, vomiting of pregnancy, bronchiectasis chronic pyosalpinx, and whooping cough. In some of these cases Wernicke's encephalopathy was an unexpected finding on routine examination of the brain and the authors expressed the belief that it was frequently missed both clinically and at autopsy

Other reports have described this condition in association with recurrent carcinoma of the uterus chronic gastritis, Hodgkin's disease pulmonary abseces, malaria, scurvy nutritional deficiency and malautrition associated with depressive psychosis. The clinical features of this illness vary to a certain extent and the predominance of one or another of the usual signs or symptoms has been thought to be dependent upon the rolative deficiency of one or another of the vitamin factors. Particular importance has been placed upon thiamin chloride and nicotinic acid.

The most frequent and the most important group of focal neurologic manifestations are the oculomotor disturbances. These include pupillary abnormalities, paralysis of conjugate eye movements diplopia strabismus, and nystagmus. Disturbances of consciousness are also prominent and include drowsness, coma, apathy excitement and delirium. The symptoms of Korsakow's psychoels with disorientation, memory loss, hallucinations, and confabulations frequently are present.

One also sees changing rigidities of the limbs ataxia, visual impairment accompanying optic neurius, and evidence, very often of an associated peripheral neuritis. Spinal fluid changes are notably not significant.

Jollife, Wortls and Fein' reported in 1941 27 cases of Wernicke's syndrome. They emphasized that a combination of several nutritional deficiencies was affecting the nervous system and that the syndrome need not necessarily be complete in any given case. Among other conclusions, they felt that the opthalmoplegic symptoms were specific evidences of thiamin chloride deficiency that these oculomotor palses frequently were accompanied by peripheral neuropathic changes, and they confirmed the thesis that smaller amounts of thiamin are necessary to prevent the policencephalopathic changes than are necessary for antineuritic action.

There has been an occasional report in the litera ture of recovery from this illness. The patient here described is an example of such a recovery

#### Report of Case

The patient was a 37 year-old married man, an intemperate drinker for many years, but more

Presented at the New York State Department of Montal Hygians, Upstate Interhospital Conference Syracuse Psychopathic Repital, April 23, 1946.

markedly so in the months just prior to his admission to the Psychopathic Hospital He had always been in good health except for hypertension of

uncertain duration

For two months prior to his entry to the hospital, considerable weight loss had been noted several days preceding admission, he had had a cough which was being treated at home by a local The patient, however, repeatedly left his bed to look out the windows, referred to people outside who he claimed were looking for him and said he saw "ghosts flying by" He believed someone was drawing blood out of his body, described electric wires over the floor and on his person, and expressed ideas of his wife's infidelity Finally, he drove away from home, gave large quantities of money to strangers, and after he had removed the wheels from his car, arrangements were at last made for his hospitalization At the time of admission, he was confused and disoriented, very excited and assaultive. He spoke loudly about his hallucinations, both visual and auditory. He described imaginary men and animals about him

One day later, his temperature became markedly elevated and he became semicomatose, appearing to Physical review revealed a fever of be in extremis 105 F, rising shortly afterwards to 108 F Pulse was 130 Respirations were 30 His heart was not enlarged, the sounds were muffled Blood pressure was 138/80 Dullness to percussion and moist rales were noted over both lung bases, although lung ev-His abdomen and pansion was bilaterally good genitalia were unremarkable Transient inconti-

nent diarrhea was present

Neurologic examination revealed semicoma, moderate nuchal rigidity, and negative Kernig signs. The pupils were equally constricted and reactive to light. Fundi and disks were normal in appearance Eve muscle movements were markedly dissociated. with one eye wandering independently of the other Pyramidal tract functions were normal, but a cogwheel type of rigidity was noted in both arms other neurologic abnormalities were apparent at the

Blood Wassermann and Kahn tests were found strongly positive, although it was later determined the patient knew nothing of luctic infection and had received no treatment Spinal fluid Wassermann and Kahn tests were negative. At the height of the illness the spinal fluid was clear with 7 cells, total protein of 32 mg, globulin was negative, gum mastic, and colloidal gold tests were negative Spinal fluid sugar and chlorides were not decreased Type 10A pneumococci were isolated from the sputum but blood culture and spinal fluid smear and culture revealed no organisms Blood count indicated a hemoglobin of 91 per cent Red blood cells were 4,860,000 White blood cells were 11,050 with 57 per cent polymorphonuclears, 18 per cent lymphocytes, 24 per cent monocytes, and 1 per cent basophils The urine revealed a persistent trace of albumin and occasional pus cells Fasting blood sugar was 130

Penicillin was administered After the patient had received 150,000 units, his fever reached 108 F At this point, the previously described neurologic signs were noted and the diagnosis of Wernicke's syndrome was made Huge amounts of thiamin chloride, nicotinic acid, and ascorbic acid in several hundred mg doses were administered three times a day intravenously in conjunction with saline and glu-Other vitamin B complex factors were given

intramuscularly

The response of the patient to this vitamin, saline, and fluid therapy, along with penicillin, was rapid and dramatic In twelve hours, the temperature was down to 100 F and consciousness and rational behavior had returned after he had apparently been on the verge of death Slight confusion gradually The delusions did not return and he completed a remarkable recovery In view of the blood Wassermann reaction, the penicillin was continued to a total of 2,500,000 units

Two weeks after admission, the patient displayed a dulled emotional tone and the suggestion of a masked facies The remainder of the neurologic examination was negative except for evidence of a localized peripheral neuritis He had a flaccid paralysis of the deltoid muscle and absent biceps reflex on the right Spinal fluid at this time was still

negative throughout
This patient, it is felt, displayed the signs and symptoms of the Wernicke syndrome, evidenced predominantly by clouding of consciousness, opthalmoplegia, and rigidity It occurred in association with a respiratory infection and in the presence of other evidences of a vitamin deficiency state, namely, alcoholic delirium tremens and peripheral neuritis recovery was due, in large part, to prompt and adequate vitamin therapy

#### SUMMERTIME

With the vacation season approaching we are in our usual dilemma on whether to stay home as we would prefer, go to the seashore as the wife and kids would like to do, or make a quick tour of our relatives as duty would have us do Something tells us we will be going to the seashore

Now that the vaccination epidemic is over, with its sore arms and extravagant tongues, we'll look to the day when people will be immunized to whatever can be positively and safely done at reasonable intervals of time to maintain their immunities But will we see that time? When did you have your last previous smallpox vaccination, Doctor?

Smallpox, diphtheria, influenza, Poliomyelitis, measles, and gout, So long as summer comes after winter, We'll go fishing wherever there's trout -Westchester Medical Bulletin June, 1947

tamın Therapy

In manifest vitamin deficiencies it is inadvisable and impractical to rely primarily on dietary correction. The deprivation of essential nutrient factors usually has existed for many years and it is important to give adequate treatment in order to restore health promptly Pluraxin is especially designed for Intensive vitamin therapy

#### Special Therapeutic Formula

Vitamin A (from fish liver oil) Vitamin B <sub>1</sub> (thismine) Vitamin B <sub>2</sub> (criboflavin) Vitamin B <sub>4</sub> (pyridoxine) Nicotinamide Calcium pantothenate Vitamin C (pyridoxine)	25 000 U.S.P. Units 15 mg 10 mg 2 mg 150 mg 10 mg 150 mg
Vitamin D <sub>2</sub> (calciferol)	10 mg 150 mg 1 000 U.S P Units

One capsule of Pluraxin daily is usually sufficient Some patients may require larger doses during the early stages of treatment. In vitamin therapy "it is far better to prescribe too much than too little too soon rather than too late" (Spies) Available in bottles of 30 and 100 capsules

# DEPARTMENT OF MEDICAL CARE INSURANCE

CONDUCTED BY GEORGE P FARRELL, Derector

Standards for Approval by Medical Society of the State of New York of Voluntary Nonprofit Medical Care Plans in New York State

Local Approval

1 Approval of the County Medical Society in

whose area a plan operates

2 In the event a county society does not approve a plan, a special committee of three members be appointed, one by the plan, one by the county medical society, and one by the Medical Society of the State of New York, to investigate and study the reasons for withholding approval

3 If, in the opinion of a majority of the committee, after consideration, approval will be granted

to the plan.

#### Professional Control

1 The governing body must contain a majority of physicians

2 These representatives shall be members of and recommended by the Medical Society of the

State of New York

3 The medical profession is to assume responsibility for the medical services included in the bene-

#### Free Choice of Physician

1 There shall be no regulation which restricts the choice of a qualified doctor of medicine in the locality covered by the plan, who is willing to participate and render service under the conditions established

2 The method of rendering service must retain the personal, confidential relationship between the

patient and physician

#### Subscriber Benefits

Subscriber benefits may be in terms of cash and/or service units

#### Claim Payments

1 When care has been rendered by a participating physician and claim filed for such care, payment shall be made direct to the participating physician When subscriber has paid the physician, then payment may be made to subscriber upon presentation of a receipted bill This method of payment should be discouraged and should apply only in instances where subscriber has paid the physician

2 When care has been rendered by a nonpartici-

When care has been rendered by a nonparticipating physician and claim filed for such care, payment shall be made direct to the nonparticipating physician or to the subscriber upon presentation of

receipted bill

#### Underwriting

1 Subscriber premium rates should be adequate to provide for the benefits offered and the risks involved in the contract

2 Plan should be organized and operated to provide the greatest possible benefits in medical care to

the subscriber

3 All plans shall conform with state statutes as set up under the New York State Insurance Department with due consideration for earned premiums, administrative costs, and reserves for contingencies

#### Enrollment

Enrollment procedures shall be on a sound basis

so as not to expose the plan to adverse selection

It is recommended that enrollment be offered to
individuals at the earliest possible date that experi-

ence of the plan warrants

#### Promotion

Descriptive folders and all promotional material shall state clearly and accurately the benefits offered by a plan, and also in the same manner, exclusions in the contract

#### Reports

All plans which have received approval, or are seeking the approval of the Medical Society of the State of New York, shall submit quarterly reports on forms provided for that purpose to the Bureau of Medical Care Insurance of the Medical Society of the State of New York

#### Duration of Approval

Approval by Medical Society of the State of New York shall be for a period of one year, at the end of which, review of all plans will be made by an appropriate committee of the Medical Society of the State of New York, to determine eligibility for renewal.

#### Comment

The Subcommittee on Medical Expense Insurance of the Council Committee on Medical Economics of the Medical Society of the State of New York has felt for some time that New York State voluntary nonprofit medical care plans should conform, in their general operation and setup, to certain requirements, in order to be eligible for approval by the Medical Society of the State of New York. The above standards were drafted by the Committee approved by the Council and adopted by the House of Delegates of the Medical Society of the State of New York at its annual session in May, 1947 They conform in general to the outline of requirements of the Council on Medical Service of the American Medical Association for approval of such plans by that body, with other necessary additions that were deemed advisable

The purpose of the standards is to maintain medical control, preserve the established doctor-patient relationship, and aid in accurate promotional material. The filing of quarterly reports by each plan on membership, claims, financial status, etc., with the Bureau of Medical Care Insurance of the State Society will permit compilation of statistical statements and aid in the establishment of benefits and premiums under sound underwriting principles.

The six plans operating in New York State are approved by the Medical Society of the State of New York and subsequent approval will be granted annually, following a study and review of each plan's adherence to the standards, by an appropriate committee of the State Society

It is the feeling of the Medical Care Insurance Bureau that these standards will maintain and further promote the voluntary nonprofit medical care movement and assure continued benefits to the public and the doctors

#### EASE AND ECONOMY OF USE

Specification of CARTOSE\* as the mixed carbohydrate for infant feed ing formulas provides ease and econ omy of use. The liquid form of this milk modifier permits rapid accurate measurement, thereby avoiding waste.

Double protection against con tamination is afforded by (1) the narrow neck of the bottle, preventing spoon insertion and (2) the press-on cap, assuring effective resealing

CARTOSE supplies nonferment

able dextrins in association with mal tose and dextrose a combination providing spaced absorption that minimizes gastrointestinal distress due to fermentation.

Available in clear glass bottles containing 1 pt. • Two tablespoonfuls (1 fl. oz.) provide 120 calories

Mixed Carbohydrates

COLUMBUS INDIANA

# NECROLOGY

Malcolm Campbell, M D, 71, of New York City died on June 1 He was professor of gynecology and former president of the faculty of the New York Polyclinic Medical School and Hospital

Dr Campbell was graduated from the Medical College of Virginia in 1901, and served his internship at the New York Polyclinic Hospital. He was a fellow of the American College of Surgeons and of the International College of Surgeons He was a member of the American Medical Association, the New York State and County medical societies, the National Gastroenterological Society, the West Side Clinical Society, and the Medico-Surgical Society

Samuel B Close, M D, of Gouverneur, died on June 3 at the age of 90 A gynecologist, he was one of the oldest practicing physicians in the State, having conducted a full practice for fifty-five years and a limited one for the past five He was graduated from the New York University, College of Medicine,

in 1885

Dr Close was secretary of the St Lawrence County Medical Society for fifty-one years and

honorary secretary for the past nine years

Clarence V Costello, M D, of Rochester, died May 31 in Beverly Hills, California, at the age of 60 Retiring in 1941 after 35 years' medical practice, Dr Costello was a former president of the staffs of St Mary's and Monroe County hospitals, in Rochester He was a graduate of the Catholic University, Washington, and the medical school of the University of Buffalo Dr Costello was a fellow of the American College of Surgeons and a member of the National Society of Medical Librarians and the Association of Railway Surgeons

Jacques Goldberger, M. D., 58, of New York City and Saratoga Springs, died on June 5 A graduate of Budanest University in 1911, Dr Goldberger came to the United States in 1939 from Kralovv Vary, Czechoslovakia He practiced medicine in New York City and Saratoga Springs, and was the author of many medical papers and several books published in Europe and this country. He was a member of the Saratoga Spa medical staff, the American-Hungarian Medical Society, the New York Academy of Science, and the State and County medical societies

Charles W Lynn, M D, of Bradenton, Florida, and formerly of New York City, died on June 4 He was 69 years old For forty-four years Dr Lynn was an official of the New York City Health Department, becoming a school inspector in 1901 He was also assistant registrar in Queens and Manhattan, and a founder of the West Side Tuberculosis Clinic He was a graduate of the College of Physicians and

Surgeons, Columbia University, in 1899
Leroy P Van Winkle, M D, of Port Jefferson,
Long Island, died on June 8 He was graduated from the Long Island College of Medicine in 1903, and interned at the Knickerbocker and Lying-In hospitals in New York City Dr Van Winkle was consulting roentgenologist at Greenpoint Hospital in Brooklyn and Huntington Hospital, Huntington, Long Island, visiting roentgenologist at Central Islip State Hospital and at Mather Memorial and St. Charles hospitals in Port Jefferson He was a member of the Brooklyn Roentgen Ray Society, the American Medical Association, and the New York State and Suffolk County medical societies

#### MULTIPLE SCLEROSIS GROUP MAKES FIRST RESEARCH GRANT

The first grant made by the Association for Advancement of Research on Multiple Sclerosis, Inc. for specialized research on multiple sclerosis, a crippling disease the cause and effective treatment of which has baffled medical men for more than a century, was announced recently by Carl M Owen, president of the Association

"This grant," Mr Owen said, "is for \$64,350, and will cover three years of important research in the field of allergy in connection with multiple sclerosis Research provided for in the grant will be under the direction of Dr Elvin A. Kabat, well known for his research in specialized fields of medicine, both before the war and in important phases of medical research for the US Army during World War II"

Dr Kabat is assistant professor of bacteriology at

He will conduct the major Columbia University portion of his work on multiple sclerosis at the Columbia University, College of Physicians and Surgeons, and at Neurological Institute of New York.

In connection with a plea by the Association that all sufferers from the disease write of their cases to AARMS, New York Academy of Medicine Building, 5th Avenue and 103rd Street, New York 29, New

York, Mr Owen added
"Public recognition of the fact that individuals all over the country can now assist science in combating a crippling disease is an important factor in the fight against multiple sclerosis. I hope that people throughout the United States will assist the Association in its work by reporting to it all the facts they know about their own cases or those of relatives and friends"

#### CORRECTION

In the "Revision of Fee Schedule" published by the Department of Workmen's Compensation in the June 1 issue, page 1300, the paragraph 'Five per cent discount for payment of bills within thirty days will be rescinded on bills for services rendered after

June 1, 1947" should read as follows

Five per cent discount for payment of bills within thirty days will be rescinded on bills ren-dered after June 1, 1947" (The corrected matter is in italics )

#### REVIEWED

Peripheral Vascular Diseases By Edgar V Allen, M.D., Nelson W. Barker, M.D., Edgar A Hines, Jr., M.D., with associates in the Mayo Clinic and Mayo Foundation Octavo of 871 pages illustrated Philadelphia, W. B. Saunders Company, 1948. Cloth, \$10 1946

This large, detailed, and comprehensive survey covers all the major aspects of diseases of the peripheral circulation It is written by a group of observers from the Mayo Clinic who have contributed

much to this field

The reader will find it necessary to stop frequently in order to evaluate many of the expressions of personal opinion by the authors They feel the "readers would not want to be left in a maze of controversy" Yet, many of their opinions are frequently open to question For example, they regard oscillometry as the least valuable of all methods of investigating the peripheral circulation and find that palpation of the vessels yields as much information. Such a statement is at complete variance with the studied experience of all the other authors of monographs on this subject great value in arteriography and venography and devote 30 pages to this subject—a method of investigation which at best is difficult, cumbersome, and not adaptable to routine work in this field authors admit that venography does not always provide satisfactory visualization of veins A W Allen and his group failed to obtain satisfactory visualization of venous thrombosis in one third of their case

Aside from these minor criticisms, the book is one of the best and most complete on the subject. It is recommended to both the physician and surgeon, for the diseases of the peripheral circulation comprise such an integral part of medicine and surgery

WILLIAM S COLLENS

Music in Medicine By Sidney Licht, MD Octavo of 132 pages Boston, New England Conservatory of Music, 1946 Cloth, \$3 00

This most interesting volume offers the gist of a series of lectures to the students of the New England Conservatory of Music The author, a practicing physician and a musician, has selected his material with skill, and concisely, yet quite completely, sets

forth the place of music in medical therapy

The chapters covering the history of music in medicine, and the philosophy and psychology of music will prove of exceptional interest to the layman as well as to the physician Detailed discussion must be omitted here, however, in view of misconceptions held even by the cognoscenti, this reviewer cannot resist the temptation to quote from an article by Gilman which the author has used in considering the interpretation of music "It is obvious that the power of music to depict objects, situations, or ideas is extremely indefinite. No matter how specific a pictorial or dramatic program the composer may have in mind to present through his music, the listener will never get that program from the music ıtself "

Music is of greatest value in institutions for the chronically ill, such as those for psychiatric or tubercular patients, but it can play an important role in the operating room, as occupational therapy, or in the convalescence from any illness In the general hospitals of the Army, music therapy was very important, its use might well be considerably extended in our civilian institutions. The author outlines a plan of organization for such a project

This book is heartily recommended to all who

share in the treatment of the sick

MAYER E Ross

Early Ambulation and Related Procedures in Surgical Management By Daniel J Leithauser, M D Octavo of 232 pages, illustrated field, Illinois, Charles C Thomas, 1946 Spring-Cloth,

The author gives an enthusiastic description of the benefit derived from early ambulation following major surgery

The patient is persuaded to be out of bed within twenty-four hours after major surgery Care is taken to protect the abdominal wound with firm strapping after secure closure with wire sutures

The wounds in these patients are found to heal more rapidly and convalescence is shortened Respiratory conditions are rare and bodily strength more rapidly re-established. The maintenance of fluid balance and prevention of dehydration are more readily attained

STANLEY B THOMAS

Rehabilitation Its Principles and Practice By John Eisele Davis, Sc D Revised edition Octavo of 264 pages, illustrated New York, A S Barnes and Company, 1946 Cloth, \$3 00

This revised edition brings the material up to date, and in a wider perspective than that presented in the first edition of 1943 Herein, rehabilitation therapists, especially those obligated to serve the mentally and emotionally sick in varying degrees,

will find a valuable and practical treatise

The author reveals marked and unusual versatility as an integrator of pertinent fields in rehabilitation This approach should be of essential value to the occupational and recreational therapist, educator of the handicapped, psychologist, social worker, and psychiatrist A handy volume, which should be at arm's reach of the busy rehabilitator

FREDERICK L PATRY

### WHENEVER NUTRIENT INTAKE MUST BE AUGMENTED

The occasion frequently arises when the intake of all essential nutrients must be increased as in general under nutrition following recovery from in fectious diseases and surgical trauma and during periods of anorexia when food consumption is curtailed

In the general management of these conditions the dietary supplement made by mixing Ovaltine with milk can find wide applicability Delicious in taste it is enjoyed by all patients young and old Its low curd tension

and easy digestibility impose no added gastrointestinal burden on the patient. This nutritious food drink supplies all the nutrients considered essential for a dietary supplement biologically adequate protein readily utilized carbohydrate easily emulsified fat B-complex and other vitamins including ascorbic acid and essential minerals. The recommended three glassfuls daily virtually assures normal nutrient intake when taken in conjunction with even a fair or average diet.

THE WANDER COMPANY, 360 N MICHIGAN AVE., CHICAGO 1, ILL.

For Practitioners and Diseases of the Skin By George Clinton Andrews, M D on Octavo of 937 pages, illustrated Third edition Octavo of 937 pages, illustrated Philadelphia, W B Saunders Company, 1946 Cloth, \$10

The third edition of this book brings the subject matter up to date, with penicillin, streptomycin, and the sulfa drugs having their appropriate places

The book is profusely illustrated with pictures that amply supplement the text, and supply a visible recording of the subject under discussion

Numerous additions and deletions have been made, in order to streamline the subject matter, and to bring it into harmony with current knowledge

The book can be used to advantage by the student, practitioner, and the specialist

George F Price

The Extremities By Daniel P Quiring, Ph D, Beatrice A Boyle, Erna L Boroush, and Bernardine Lufkin Octavo of 117 pages, illustrated delphia, Lea & Febiger, 1945 Cloth, \$2 75

For teaching purposes and for a rapid superficial review of gross anatomy of the musculoskeletal part of the extremities, the book has some value Also, for those interested in locating approvimate motor points of the extremity muscles, the diagrams may be useful in a practical way

WALTER SCHMITT

The Second Forty Years By Edward J Steightz, M D Octavo of 317 pages, illustrated phia, J B Lippincott, 1946 Cloth, \$2 95

This volume is a worthy addition to the many that have appeared recently. The long neglected subject of "Old Age" has finally come of "Age." This work differs from others in that it is written primarily for the layman, not that the doctor also would not profit by its perusal. It is difficult in a brief review to cite its many interesting features and to present some differing views Suffice it to say that it contains so much good advice and so much common sense that it does greatly help one in "Growing old gracefully, happily, and usefully," and that is an

S R BLATTEIS

Problems in Abnormal Behavour By Nathaniel Thornton Duodecimo of 244 pages Philadelphia, Blakiston Company, 1946 Cloth, \$2 00

This book deals with the vagaries and irregularities of human behavior It is intelligently written and in language that general practitioners and laymen can fully understand

Mr Thornton's experience in teaching abnormal psychology has enabled him to present the subject in a clear and interesting manner

The author discusses his subjects frankly and in the light of the more recent advances in psychology. psychoanalysis, and psychiatry

WILLIAM E McCullough

Muscle Festing Techniques of Manual Programmation By Lucille Paniels, MA, Marie Axamina-MI, and Cathering Worthingham and Williams, of 189 pages, illust ated Phi MA Quarto Faunders Company, 156 Paperadelphia, WB This paper-covered illustrated, loose-leaf manual

is of value to Departments of Physical Medicine and The authors compare methods of mual muscles tests If they could Orthopedics grading of manual muscles tests widely publicize to the medical profession methods as used by the Committee on After Effects, National Foundation Infantile Paralysis, they would have attained much

JOHN J HAUFF

Intracramal Complications of Ear, Nose and Throat Infections By Hans Brunner, M D Octavo of 444 pages, illustrated Chicago, Year Book Publishers, 1946 Cloth, \$6 75

The profession will appreciate a condensed yet complete volume on intracranial complications of ear, nose, and throat infections

Few authors are better qualified as the result of personal investigation based on so much clinical and laboratory data

Brunner describes in detail various avenues of infection of intracranial structures originating in and about the ear, and paranasal sinuses and the logical methods of localizing and combating such lesions

The book is adequately illustrated and practically arranged The author and publishers are to be com plimented

H MEYERSBURG

By Lt Col. A Concise Presentation Henry J John, M C Octavo of 300 pages, illus St Louis, C V Mosby Company, 1946 trated Cloth, \$3.25

The principles involved in the recognition and management of diabetes mellitus and its complications are presented by a clinician of national stand-It is written for the general practitioner and is based on the author's personal experience in handling more than 5,000 diabetics. An almost excessive number of case histories are presented. The best number of case histories are presented chapter that summarizes the author's rich experience is entitled "Some 'Do's' and 'Don'ts'

The author has presented a point of view based on his interpretation of clinical and experimental This is difficult to do in diabetes without appearing to oversimplify some problems Rather broad conclusions and interpretations are drawn from some individual case reports in the opinion of this reviewer

DUNCAN W CLARK

The Personality of the Preschool Child The Child's Search for His Self By Werner Wolff Octavo of 341 pages, illustrated New York, Grune & Stratton, 1946 Cloth, \$5 00

The author states that one can form a fair esti mate of the personality of a preschool child by considering together the summary of the behavior of that child as given by the trained staff of a nursery school, the graphic expressions of the child (drawappropriate interpreted by an expert in this field, and the child's ill guage interpretations of his own draw-This type of approach he calls psychology in depth and includes an excellent survey of personality studies to date

[Continued from page 1622]

An Atlas of the Commoner Skin Diseases By Henry C G Semon, D M Third Edition Octavo of 343 pages, illustrated Baltimore, Williams & Wilkins Company, 1946 Cloth, \$12

This is a most excellent addition to the armainentarium of any medical man. In its 341 large-sized pages, over one hundred and thirty excellent, modern plates in full color are certain to offer its possessor much assistance in the diagnosis of all of the commoner diseases of the skin, but an added section now includes many of the uncommoner diseases. Unlike most atlases, the author's text is very enlightening and instructive, especially on treatment

NATHAN THOMAS BEERS

Clinical Methods of Neuro-Ophthalmologic Examination. By Alfred Kestenbaum, M D Octavo of 384 pages, illustrated New York, Grune & Stratton, 1946 Cloth, \$6 75

It seems to the reviewer that the book was written more for the neurologist who would like to know about ophthalmologic conditions. The tests enumerated are numerous, many without much merit, so that the average ophthalmologist would be confused. A serious defect is the lack of sufficient simple illustrations, while much included properly belongs to books on ophthalmology, such as the tests for phorias and tropias. The chapter on nystagmus is excellent although repetitious. The book is not without merit and would serve as an excellent reference for those especially interested in the subject

DANIEL KRAVITZ

Gastroenterology in General Practice By Louis Pelner, M D With the collaboration of Louis A Held, M D, and contributions from Alexander Lewitan, M D, Samuel Waldman, M D, and Siegfried W Westing, M D Large octavo of 285 pages, illustrated Springfield, Illinois, Charles C Thomas, 1946 Cloth, \$750

This book was written with the aim to include most of the gastrointestinal diseases met with by the practitioner. It was intended as a practical presentation rather than a complete reference work. It has met this purpose adequately, to serve as an introduction to the specialty of gastroenterology.

In order to present this subject from a clinical, laboratory, radiographic, and psychosomatic aspect in a short text, there resulted, of necessity, some brevity and limitation of details. This book should prove valuable to those physicians desiring an introduction to this specialty.

M J MATZNER

Medical Research A Symposium Edited by Austin Smith, M D Octavo of 169 pages, illustrated Philadelphia, J B Lippincott, 1946 Cloth, \$5 00

This is a modest volume of 159 reading pages, contributed by nine men, whose standing is of such eminence that whatever each one writes is well worth

serious attention

We are inclined to accept the results of medical research without much thought of the untiring effort, the heartaches, the many disappointments that enter into the final achievement

All phases of this question are agreeably and entertainingly presented here. The chapter on the Fundamentals of Medical Research by Dr. Torald Sollmann is a delightful experience. And the one by Dr. Walter C. Alvarez on Chinical Research with a Note Book should stimulate the clinician toward a more liberal use of "eyes, ears, and a notebook."

The chapter on Photography in Medical Research by Drs Milton G Bohrod and H Lou Gibson is a revelation to the uninformed Herein are contained a number of beautiful illustrations And in like manner all the other contributors adequately fulfill their mission

All in all the reader on completion of this small volume will have his respect and regard for Medical

Research greatly deepened

S R BLATTEIS

Treponematosis By Ellis H Hudson, MD Edited by Henry A Christian, MD Octavo of 119 pages New York, Oxford University Press, 1946 Cloth, \$2 50 (Reprinted from Oxford Loose-Leaf Medicine)

Treponematosis denotes and includes a series of diseases with protean manifestations which present different clinical patterns under different climatic and sociologic conditions, and all have a common factor in the etiology, in that they are all caused by the treponeme

Most physicians have a very hazy conception of yaws, and nonvenereal syphilis is a medical curiosity Syphilis and sex are invariably linked and they do not know that this is only part of the story. The fact is that the same disease under other names runs riot through many parts of the world as a childhood disease, without reference to sex

This book will be very instructive to physicians who are interested in the treatment of diseases

caused by the treponeme

PHILIP GOLDFADER

Harvey Cushing A Biography By John F Fulton, M D Octavo of 754 pages, illustrated Springfield, Illinois, Charles C Thomas, 1946 Cloth, \$500

This book deals with the life story of a great medical pioneer I' roughout, it indicates Cushing's many contributions to experimental and clinical surgery, particularly in the field of neurologic surgery, his stimulating association with younger men, his unusual literary gifts, and his human personality The author, Dr John F Fulton, a friend and associate of Cushing, has had access to an unusually rich source of materials, which Cushing systematically preserved throughout his life, and which the author has treated with objectivity and great understand-The result is an account of a brilliant medical figure, a stimulating teacher, scientist, surgeon and, above all, a "good doctor". The medical student, the person interested in a thrilling period of American can medicine, and the general reader will find the biography of Harvey Cushing absorbing and stimulating

EMIL GOETSCH

The Diagnosis and Treatment of Bronchial Asthma By Leslie N Gay, M D Octavo of 334 pages, illustrated Baltimore, Williams & Wilkins Company, 1946 Cloth, \$500

This text endeavors to meet the needs of the medical student, the internist, or medical diagnostician, and the general practitioner of medicine. It is apparently not intended for detailed study by the allergist, though certain aspects of bronchial asthmas, such as pathology, pollen surveys, psychosomatic considerations, and the local treatment of lymphoid tissue in the nasopharnynx by radium are presented fairly extensively.

Are Doctors Competent to Deal With Health?

MESSRS Wagner, Murray, and Dingell have frequently been severely criticized because their legislative proposals for compulsory health insurance have been written without benefit of medical advice or counsel In fact, we believe it has been rather well established that this much-discussed national health program bill, like most other health insurance acts proposed in the various state legislatures, was drafted exclusively by nonmedical people

Until recently the quaint proposition that medical men might be presumed to have a special competence in dealing with health or medical legislation never appeared to arouse much interest outside medical

circles

On March 5, however, this theory received unexpected support from a rather surprising source when Mr Van A. Bittner, organizing director of the CIO, told the Labor Committee of the House of Representatives that "men who know nothing about a proposition shouldn't deal with it" Mr Bittner declared that the members of this Committee were not "going to give labor a fair break" because "there are no labor men on this committee"

"I doubt if the twenty-five men on this committee who know very little about labor relations could write a good labor bill," said Mr Bittner, and, he observed, "Twenty-five blacksmiths would be a poor crowd to deal with medical and health problems Twenty-five doctors might do a good job

Apparently it all depends upon whose bed is being made up, for we don't recall that the representatives of organized labor expressed any misgiving as to the competence of the Senators serving on the Committee on Education and Labor of the 79th Congress to write satisfactory health and medical legislation (Satisfactory, that is, to organized labor )

On the other hand, the idea that professional men are qualified to administer professional affairs apparently does not appeal to the Honorable Watson B Miller, Federal Security Administrator, who is quoted in the New York Herald Tribine as having told the Expenditures Committee of the US Senate on March 17 that it would be "dangerous" to require the Under-Secretary of Health (provided for in the Taft-Fulbright Bill) to be a licensed medical doctor and the Under-Secretaries for Education and Labor to be "experienced and trained professionals" in their respective fields

The bill would set up a Secretary of Health, Education, and Security in the President's Cabinet with Under-Secretaries for each of these fields who would be people of recognized standing in their respective realms Mr Miller, it seems, does not like this idea He questioned whether the three professional Under-Secretaries could "allay the specialized bureaucratic interests and pressures which the very nature of their appointments would almost certainly call forth" He expressed doubt that they "could be in a position to contribute to the balanced program the people have a right to expect Professional limitations (sic) for such top-level officers are foreign to our history," he declared — New York Medicine April  $\delta$ ,

#### COMMUNITY PROGRAM TO FIGHT HEART DISEASES TO BE EXPANDED

Plans to expand the number of local groups of the American Heart Associations in the United States were announced in June at the Twenty-Third Annual meeting of the Association

Describing the number of local Heart Associations as madequate to meet the nation-wide need for research, service, and education, Dr Howard F West pointed to the tremendous increase of public interest

in diseases of the heart and circulation "This interest," he said, "was demonstrated during National Heart Week in February, and it is now being shown by the continuous requests from communities throughout the nation for assistance

in organizing local Heart Associations in their areas "
The reorganization of the American Heart Association to provide for the admission of laymen on all of the Association's governing and executive bodies, was cited by Dr David D Rutstein, medical director, as an important step in securing the full cooperation of scientific and lay groups in developing addi-

tional local Heart Associations

Officers for the 1947-1948 term were elected at the annual meeting of the association Dr Arlie R. Barnes, chairman of the Board of Governors of the Mayo Clinic, Rochester, Minnesota, was elected president President-elect is Dr Tinsley R Harrison, professor of medicine, Southwestern Medical College, Dallas, Tevas Other officers elected were vice-president, Dr Carl J Wiggers, Cleveland, traesurer Samuel Hard Wiggers, the Ages treasurer, Samuel Herrell, president of the Acme-Evans Company, Indianapolis, and secretary, Dr Harry E Ungerleider, of New York City A contribution of \$17,629 received from the New

York area in response to the Association's drive for funds to support research and service in the cardiovascular diseases in the metropolitan area was announced by Dr Edwin P Maynard, Jr, president of

the New York Heart Association

### sparkling companion...

#### to the sulfonamides

When sulfonomides are administered a sparkling glass of ALKA ZANE Alkaline Efferyescent Compound makes a worthy companion provid ing cations and fluid to protect against crystalluria

One heaping tablespoonful of ALKA-ZANE in a glass of water as a refreshing chaser for each dose of the sulfa drug serves to

- guament the alkaline reserve
- alkalinize the urine
- · encourage fluid intake
- produce a mild diuretic effect

To ensure maintenance of proper pH levels during sulfonamide therapy make ALKA-ZANE a companion prescription to the sulfa drugs.

One heaping teaspoonful of ALKA ZANE In solution provides 41 0 gr (2.7 Gm.) sodium citrate 250 gr (1 6 Gm.) sodium bicarbonate 3 8 gr (0.25 Gm.) magnesium phosphate

As the published reports pile up—now in the hundreds—short acting Nembutal is being applied in an increasing variety of conditions The list at right is only partial . Because doses adjusted to the need can achieve any desired degree of cerebral depression, from mild sedation to deep hypnosis, short acting Nembutal naturally lends itself to extensive application • Small dosage—only about one half that required by many other barbiturates-adds the advantages of shorter effect, reduced possibility of after-effect, marked clinical safety and definite economy to the patient • In most cases, doses as small as these will suffice for mild sedation, 1/4 to 1/4 gr., for simple insomnia, 1/2 to 1 gr, for true hypnosis, 11/2 grs, for pre operative medication, 11/2 grs the night before and 11/2 to 3 grs two hours preceding the operation • Your pharmacy can supply you with any of 11 Nembutal products in convenient small dosage forms to fit any short acting sedative and hypnotic need

In equal oral doses, no other barbiturate combines QUICKER, BRIEFER, MORE PROFOUND EFFECT than

#### Robert Koch (1843 1910) proved it in bacteriology .

Koch showed in his postulates that he knew the value of experience. Specificity is demonstrated only when the microorganism (1) is present in all cases of the disease (2) can be cultivated in pure culture, (3) produces the disease in susceptibles on inoculation and (4) can be recultivated in pure culture.

Yes, and experience is the best teacher in smoking too!

The wartime cigarette shortage was a real experience for smokers. Millions of people smoked whatever brand was available—more different hrands than they might ordinarily have tried in years. And from that experience so many more smokers chose Camel as their eigarette that today more people are smoking Camels than ever before.

But, no matter how great the demand, we don't tamper with Camel quality Only choice tobaccos, properly aged and blended in the time-honored Camel way are used in Camels.

According to a recent Nationwide survey:

More Doctors smoke Camels

### NOW AVAILABLE AGAIN ...

The ORIGINAL ENTERIC COATED TABLET OF THEOBROMINE SODIUM ACETATE to control frequency and severity of attacks in CARDIOVASCULAR AND RENAL DISEASES and to prevent EDEMA Clinical experience and studies have proven the value of Theo-

bromine Sodium Acetate in certain Cardiovascular and Renal Diseases In Angina Pectoris, used adequately, it permits more work by the individual without developing precordial pain or distress. As one of the most effective Xanthine Vasodilators it helps increase the available blood supply to the heart and kidneys to increase the efficiency of these organs

It has also been found an effective aid in treating and preventing Edema of Cardiac or Renal origin. The enteric coating (especially developed for Thesodate) permits larger doses without the drug's contact with the Gastric Mucosa

Supplied-in 714 grains with and with out Phenobarbital 1/2 grain in 5 grains with Potassium Iodide 2 grains and Phenobarbital 1/4 grain and in 3 % grains with and without Phenobarbital 14 grain. Capsules, not enteric coated. are available in the same potencies, for supplementary medication.

# sefficials PROPHYLAXIS of wrinary tract infections

High renal safety and the proved effectiveness of small doses combine to make SULAMYD best fitted for prophylaxis of urinary tract infectious Invasion of the urinary tract by pathogens following polyic surgery diagnostic and thera pentic cysto-copy and repeated catheterizations can be prevented by as little as 20 grams SULAMYD daily Crystal ( luris and hematuria are extremely rare and concrement formation has never been reported with SULAMAD. The danger of oliguria and anuria is practically nil with doses recommended for prophylaxis

(Sulfacetimide Schering)

Among four thousand postoperative patients treated prophy lactically with various sulfonamides it was demonstrated that SULANYD never caused blockage of catheters with crystals.1

Dosage for prophylaxis of urinary tract infections: 0.5 Cm. SULAMYD four times daily

SULAMYD (Sulfacetimide-Schering) Tablets 0.5 Gm. in hottles of 100 and 1000 L. Yesmes, P. A. i Drei & Cat Res 40 122, 1913.

The sense of well being so frequently reported by patients following Premarin therapy often means the difference between an active enjoyable middle age and a sedentary one Not only prompt relief from distressing menopausal symptoms but also a brighter mental outlook which may be translated into a desire to be doing things—such are the results which may usually be expected following Premarin administration—therapy with a plus

Premarin provides effective estrogenic therapy through the oral route with comparative freedom from untoward side effects

Premarin is available as follows:

Tablets of 2.5 mg Tablets of 1.25 mg Tablets of 0.625 mg

bottles of 20 and 100 bottles of 20 100 and 1000 bottles of 100 and 1000

Liquid containing 0 625 mg in each 4 cc (1 teaspoonful) bottles of 120 cc.

While sodium estrone sulfate is the principal estrogen in Premaria," other equine estrogens estradiol equility, equilent, hippulin are also present as water soluble sulfates. The water-solubility of conjugated estrogens (equine) assures rapid obsorption from the gastrointestinal tract

(equine)

### Elixir Bromaurate

GIVES EXCELLENT RESULTS

Cuts short the period of the illness and relieves the distressing spasmodic cough Also valuable in Branchills and Branchiel Asthma. In four-ounce original bottles. A teaspoonful every 3 to 4 hrs. (Contains one-half grain Gold Tribromide in one fluidounce. Alcohol 234% by values)

GOLD PHARMACAL CO., NEW YORK CITY

In the opinion of many clinicians, policic distortion is the most serious result of rickets. I Severe deformities which obstruct childbirth and may cause death of both mother and infant 2 as well as the so-called simple flat pelvis 3 are often rachitic in origin. In the prevention of rickets and other vitamin deficiency syndromes, the use of Vi Penta Drops 'Roche' offers clinically important advantages. The drops are willingly taken even by difficult patients since they are miscible and may be added to milk, fruit juice or other foods without significantly affecting the flavor. The comprehensive formula of Vi Penta Drops supplies in each 10-minim dose no less than 1000 U.S.P. units of vitamin D plus ample amounts of vitamins A, B1, B2, C and niacinamide VI Penta Drops are available in 15-cc and 30-cc vials. For a free trial supply, write to department V 3, Hoffmann-La Roche Inc., Roche Park, Nutley 10, New Jersey

#### UNDERLYING ALLERGIES

ARE RESPONSIBLE FOR SYMPTOMS IN LARGE NUMBERS OF PATIENTS WITH NASAL DISEASE

#### The WYETH ALLERGEN TESTING SET

Indispensable for Routine Diagnosis by the Sensitive, Accurate Intracutaneous Method

In patients with seasonal symptoms and those with upper respiratory disturbance the year round an allergic background should be suspected

WYETH Allergens in Tubex are injected directly into the islin without dilution or transfer from vial to syringe. Thus there is little possibility of contamination and one syringe serves for all injections. Each Tubex Contains sufficient extract for 20 to 30 tests. Reactions usually appear in 10 or 15 minutes.

Each complete testing set contains 200 Standard Diagnostic Allergens (N N R ) in Tubex 1 Tubex Syringe 3 Tubex Epine phrine Hydrochloride Solution 3 Tubex Buffered Saline 3 Tubex Distilled Water 1 doz. Tubex Needles 20 Diagnostic Charts in wooden cabinet.

Also available 107 Special Allergens for Extended Testing and 40 Group Tests in cluding up to six individual allergens each

The Tubex unit a polies allergenic extracts or other materials in a glass carridge which is inserted into the Tubex syringe to form a closed system ready for immediate inhecitor.

T bex syringes, developed and produced by J Bushop & Co are used exclusively by Wyeth Incorporated

# Fundamental Pattern WALKING OVARIANTAL

in MENSTRUAL DISTURBANCES, cyclic security is dependent upon maintenance of ovarian rhythm Re placement therapy with estrogens and progesterone to improve physiologic function, followed by true stimulation with equine pitulary gonadotropins (GONATROPE Forbes) to promote ovarian receptivity is therefore a fundamental pattern of therapy for hypo-ovarian function.

A plan of successful estrogen therapy as part of this fundamental pattern, is the use of an ovarian stimulus emulating the prolonged rhythm of normal ovarian activity Natural CRYSTALLINE ESTROGENS in Aqueous Suspension (Forbes) is a highly potent purified product free from allergens or foreign proteins, with prolonged effect which provides a uniform release of estrogens in the circulation. Crystalline estrogen maintains a more uniform blood level and normal ovarian secretion is simulated more closely

#### Natural CRYSTALLINE ESTROGENS

in Aqueous Suspension (Forbes)

Potencies: 10,000 LU (Img.); 20 000 LU (2 mg.) in vials and ampuls

# fissured nipples...

White's

LABORATORIES, INC , Pharmaceutical Manufacturers, Newark 7, N J

Our observations clearly indicate that the use of Vitamin A and D Ointment (White 3) in the local care of the puer peral nipple gave protective and thera peutic results much better than those obtained by other methods."1

Pleasantly fragrant, White s Vita min A and D Ointment is ideally suited to nipple care in the pregnant or lactating woman. Prophylactic treatment from the 7th month of pregnancy through lactation prevents fissured nipples in most cases. Local

application initiates granulation and promotes rapid epithelization in injured areas,

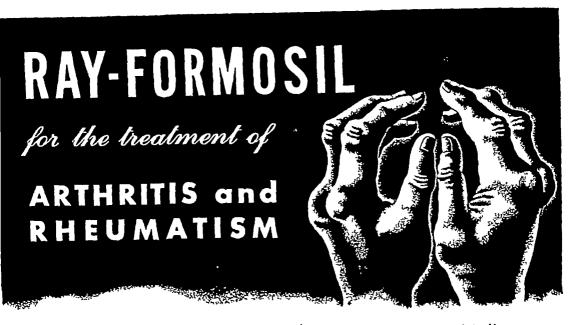

White s Vitamin A and D Oint ment provides the vitamins A and D derived exclusively from fish liver oils, in the same ratio as found in cod liver oil in a lanolin petrolatum base Pharmaceutically elegant keeps indefinitely at ordinary temper atures does not stain tissues. In 1.5 co., tubes 8 oz. and 16 oz. jars 5 lb. containers.

FORMULAO Infant Food provides a balanced and flexible formula basis for general infant feeding — both in normal and difficult det cases.

A product of National Dairy research Formulac is a concentrated milk in liquid form fortified with all vitamins known to be necessary for proper infant nutrition. No supplementary vitamin administration is necessary with Formulac. The Vitamin C content is stabilized assuring greater safety.

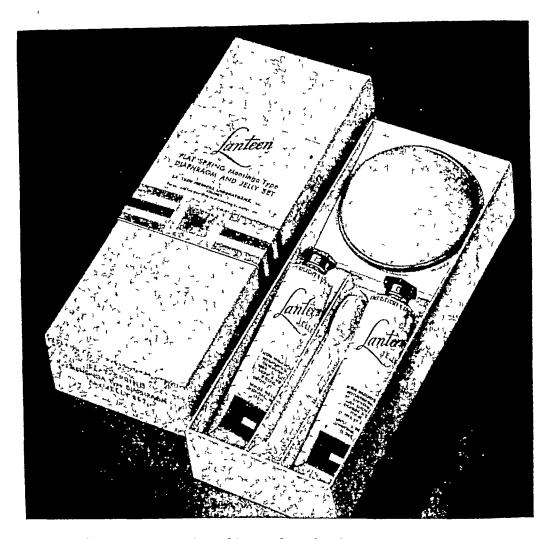

The only carbohydrate in FORMULAG is the natural lactose found in covs s milk—no other carbohydrate has been added. This permits you to prescribe both the amount and the type of carbohydrate supplementation required.

FORMULAC is promoted ethically, to the medical profession only Clinical testing has proved it satisfactory in promoting normal infant growth and development. On sale in grocery and drug stores throughout the country FORMULAC is priced within range of even modest incomes.

#### GIFT FROM THE AMERICAN COLLEGE OF SURGEONS

The President of the American College of Surgeons, Dr Irvin Abell, has sent Sir Alfred Webb-Johnson a cheque bringing the total contribution of that College to the restoration of the English College to over £10,000, and a brochure recording the names and addresses of the Fellows of the American College who have contributed to this memorable gift is being prepared. It may be recalled that the Great Mace of the American College was given by the consulting surgeons of the British Army in memory of mutual work and good-fellowship in the war of 1914–1918.

In the course of his letter to Sir Alfred Webb-Johnson, Dr Abell writes "From its founding in 1913 the American College of Surgeons has been benefited by its cordial relations with the Royal College of Surgeons of England, after which it was in many respects patterned Sir Rickman Godlees, a nephew of Lord Lister, was president of the English College in 1913, and he personally represented his organization at the inaugural convocation of the American College of Surgeons, presented an official message of greeting, good wishes, and hope, and was received into Honorary Fellowship in the newborn College Since that eventful occasion many mutual interests have strengthened the bonds between the two organizations and their individual members."

two organizations and their individual members."
The American College will make a presentation of a desk and lectern for the lecture theatre of the English College during the Congress of the International Society of Surgery to be held in London in September of this year—British Medical Journal, May 31, 1947

## VIRTUE OF DIGITALIS LEAF

### OF DIGITALIS LEAF BUT NONE OF ITS DROSS

Digitaline Nativelle the original digitoxin provides all the therapeutic virtue of the whole leaf of Digitalis purpures when it is thoroughly free from the mert impurities and dross when the leaf contains in its crude form. This high degree of purification makes possible rapid digitalization by the oral route with virtual freedom from locally induced nauses and vomiting. Absorption from the gastrointestinal tract is prompt and complete. Hence the dosage and speed of action are identical by the oral route and on intravenous administration.

Initial digitalization is achieved in 6 to 10 hours by the oral administration of 1 2 mg of Digitaline Nativelle given as a single dose or in two equal quantities of 0.6 mg at an interval of 3 hours. Maintenance thereafter is easily effected by a dosage of 0.1 mg to 0.2 mg daily depending upon the extent of the patient's activity and individual responsiveness to the drug.

Digitaline Nativelle is indicated whenever the action of digitalis is called for—congestive heart failure auricular fibrillation auricular flutter. To make certain that your patient will receive the original digitorum kindly specify Digitaline Nativelle on your prescriptions.

Physicians are invited to and for complimentary connut for complimentary of the brechare "Manage must of the Eatling Hears and a clinical test sample of Degitaline Nativelle sufficretto digitalize one patient

#### Editorials

#### The Pure Investigator

We quote from a book that deserves to be more widely known than it is. "It seemed to Plulip that the people who spent their time in helping the poorer classes erred because they sought to remedy things which would harass them if they themselves had to endure them, without thinking that they did not in the least disturb those who were used to them. The poor did not want large airy rooms, they suffered from cold, for their food was not nourishing and their circulation bad, space gave them a feeling of chillness, and they wanted to burn as little coal as need be, there was no hardship for soveral to sleep in one room, they preferred it, they were never alone for a moment, from the time they were born to the time they died, and loneliness oppressed them, they enjoyed the promiscuity in which they dwelt, and the constant noise in which they dwelt pressed upon their ears unnoticed. They did not feel the need of taking a bath constantly, and Philip often heard them speak with indignation of the necessity to do so with which they were faced on entering the hospital, it was both an affront and a discomfort. They wanted chiefly to be let alone. "1

For many years we have wished that those lines might be read daily to everyone entering upon a life of Social Service. What a preventive of busybodyism and moral snobbery they might be! They were written out of Mr Maugham's experience as a medical student doing outpatient obstetric work. They recalled an experience of ours under similar circumstances when we visited bluetering invective upon a woman who, one-day postpartum, was up cooking dinner for her family

"Young man, when you've had as many babies as I have I'll listen to you telling me what to do."

Early convalescence was not fashionable in those days

Salvation can never be inflicted on the poor by prying uplifters. The desire for it must come from within and the roots of the desire possibly may be stimulated and nurtured by education.

Thinking along those same lines—that a wide acquaintance with humanity in all its

<sup>&</sup>lt;sup>1</sup> Maugham, W Somerest: Of Human Bondage, New York, George H. Doran Company 1915, pp. 598-99 <sup>2</sup> New York Times, Magazine Section, April 20, 1947 page

phases was an essential part of a doctor's training—our eye tripped over the following sentence, which occurs in an article on racial tensions in the city of Detroit and the measures being taken to combat them "They include volunteer investigators and reporters upon social conditions teachers, social workers, ministers, students, bartenders, union leaders, shop foremen, and merchants, representing different geographic areas, racial, and religious groups"<sup>2</sup>

Why does not the group include doctors? The doctor should be the ideal investigator. He can go anywhere and be welcomed anywhere because, wherever he goes, he is minding his own business. He is not easily shocked by what he sees, because no matter what he encounters he often has

seen worse elsewhere He invades his territory because he is invited into it to relieve pre-existing suffering, not because he wants to poke his nose into a nasty situation so that he can write a thesis for his Ph D on the disgusting conditions he uproots. He is not swayed by preconceived theories as to what social conditions ought to be. He is summoned to face a fact and to do the best he can about it.

We wish Detroit every success in its effort to ward off trouble, but we think the city might get further if it included in its investigative staff a few hard-headed, unsentimental, practical doctors, who only encountered the unpleasant facts they found because they were invited to see them while minding their own business

#### Bars or Freedom

Somewhere in Belgium there is a happy village. We cannot at the moment recall its name, and if we could, we would not print it because we do not wish its happiness to be disturbed by swarms of curious visitors from the outside world.

A majority of its inhabitants are insane Coming from everywhere in Belgium they are committed to the town instead of being confined in institutions. We don't know what the Belgian criterion of insanity may be. We do know that in this country fai too many of our potentially useful fellow critizens are locked up behind bars, kept at the public expense, when in the opinion of their families, their friends (?), and their communities, their conduct deviates no more than slightly from the normal

With the exception of the indisputably violent, who are as dangerous to their fellow men as might be a frightened tiger evicted from his cage into the unfamiliar environment of the ordinary world, most of the insane are not so bad. What the exact dividing line is between them and us is difficult to establish

Are there not hundreds of us who wish we could withdraw from our environment? Are there not thousands who wish they could escape the perils of love, the struggle for existence, the "slings and arrows of outra-

geous fortune" An insane person is simply one who has more or less successfully done so He has shifted his burdens from his own shoulders to those of the State Smart felloy

The kindly citizens of our Belgian town recognize that fact If a man arrives among them who is happy in the belief that he is Napoleon, they welcome him and allow him to establish his Empire over the village pigs How they treat a woman who thinks she is Cleopatra we don't know But we don't believe she suffers from lack of attention

We are daily bombarded in the public prints by horrendous statistics of the rising percentages of the insane. Perhaps we are getting a little too fussy about who is insane and who isn't

Some years ago a Southern lady, somewhat over fifty, came to our office to ask if we couldn't help her get a former pupil of hers out of the Hudson River State Hospital We were astonished The request seemed a little out of our line Then she mentioned the lady's name, and we at once remembered her as one of the most beautiful memories of our college days Three marriages, it seemed, had somewhat upset her, and one of her families had had her committed

"What made them think that she was crazy?" we asked

"The last time they let her out of the Hospital she went to Washington, took a room in a hotel, bought a bottle of whiskey and cut her telephone wire"

"We've often wished we had guts to do that very thing That doesn't make us

think that she was crazy"

Our visitor looked surprised, but an unexpected gleam of sympathy suffused her eye Such a statement from a damnyankeel

"Well, if that is your point of view perhaps you would help me to persuade them to let her come down to live with me It's an old Southern city and there isn't a family of any decent age and respectability in it that hasn't an aunt, uncle, cousin, or some aged relative, no matter how distant, living with them, who isn't a little bit queer

"They aren't regarded as insone They are simply members of the first families who for one reason or another are considered as amiably eccentric—practically the equivalent of a

patent of respectability"

Our efforts for liberation and custodial care were unsuccessful, but the incident gave us to think About that town in Belgium Most normal people in normal

towns don't get on so well The divorce rate rises constantly

Suppose you and your wife lived in a community in which 75 per cent of the community were admittedly insane? Your husband is not everything that you might wish. Neither is your wife.

But as you survey the community you have constant reassurance that there are lots of people in it crazier than you are. Such an

assurance is always heartening

What is a normal person? Does anybody know? It might not be a bad thing if more of our citizens, labelled as slightly deranged, were distributed among our self-considered normal ones. The constant comparison afforded might sharpen our perceptions in regard to the gradations of mentality. What beautiful charts would result.

Under such a system of constant admixture of the normal and the abnormal, of constant observation by the community at large of the various manifestations of in sanity, such persons as Hitler and Mussolim might have been nipped in the bud Who knows? And how much happier they and many others would be now if they had been

#### Our Waning Intelligence

The British Medical Journal¹ comments editorially on what it terms the "distant prospect of a 'galloping plunge to intellectual bankruptcy'" It seems that the Eugenics Society has published, in a booklet by Sir Cyril Burt, experimental data which "strongly suggests the possibility that, if present population trends continue

(England) faces a progressive decline in the level of our national intelligence."

More intelligent parents in every social class in Great Britain apparently tend to have smaller families. Such a trend in the more numerous working class seems to the British Medical Journal "to be the most ominous portent of all". Methods of evaluation of intelligence and prognostication in population statistics are notoriously difficult. But the subject is serious enough to demand large-scale studies, intensively undertaken by a team "drawn from psycholo-

gists and psychiatrists, sociologists and statisticians." Objective assessment of the facts will need the combined endeavor of mon trained in all the social sciences.

Under the title "Breeding Out Intelligence," the Lancet last year commented upon the 1946 Galton Lecture to the Eugenics Society by Professor Thomson

Prof Godfrey Thomson made a disquieting statement on the trend of national intelligence Having been particularly interested in the selection of children for prolonged school and university courses, he is fearful of the end-result of this lengthy training and for delay or failure in marriage or procreation that it entails 'The educational system of the country' he said, 'note as a sieve to aift out the more intelligent and destroy their posterity It is a selection which ensures that their like shall not endure'

<sup>1</sup> Feb 1 1947 p. 185 1 The Lancet, London No 6418, Aug. 10, 1946, p. 204-

Perennially the question arises as to whether or not the human race is breeding out intelligence. At the moment, three publications lie at hand. The Lancet, London, of August 10, 1946, Human Fertility, Vol. II, No. 2, June, 1946, and The Survival of the Unfittest, Birthright, Inc., Princeton, New Jersey. All three publications above cited exude gloom. The Lancet says, in part

In a survey of the results of intelligence tests in a group of nearly 3.000 school children, Thompson and Sutherland found that there was a negative correlation (r = 0.25) between intelligence quotient and size of family means that, in 60% of the families studied, smallness of family was associated with mental ability above the average There is a consistent trend from the 66% above-average intellects in only children to the 39% above-average intelligence-test results in families of over That this was not wholly due to difseven ferences in home environment was shown by subsequent demonstration of a similar association in the children of miners on the same social level

This earlier work was strikingly confirmed by a very comprehensive study, by Fraser Roberts and his associates, of intelligence among an entire age-group of the children of Bath They, too, showed this definite negative association between the children's intelligence quotient and the size of the family to which they belonged

Human Fertility (loc cit) publishes an article by Clarence J Gamble, M D, "The Deficit in the Birthrate of College Graduates," raising the spector of the Dodo bird for the male and female college graduates in measured phrases and words of solemn portent

The need of large numbers of a highly educated personnel in modern society is obvious and the evidence of a present deficit in those with the hereditary qualities needed to absorb such education is inescapable

To all of which Marion S Olden in Birthright, Inc., (loc cit supra) adds The Survival of the Unfittest, in which Henry Pratt Fairchild is quoted on population trends

The population of the world up to a century

and a half ago was much more nearly stationary than we are inclined to suppose suddenly something happened during the Nineteenth Century humanity added much more to its total volume than it had been able to pile up during the previous million years, and in 150 years it nearly trebled the number These are the most amazing figures in the whole gallery of statistical pictures essential significance is actually incomprehensible We are blind to it only because the habituation of our own individual life-time causes us to regard as "natural" or "normal" that which is really absolutely unique in human experience

The article includes extensive analyses of statistics to show what sort of people are producing those who will be responsible for the future of this country It is shown that college graduates and high-school graduates had underreplaced themselves by 45 per cent and 21 per cent, respectively, while those with only one to four years of grade school had overreplaced themselves by 95 per cent Also, it was found that the lowest economic third of our families have overreplaced by 76 per cent, while the highest economic third has underreplaced by 19 per This difference has increased among women of 30 to 35 years

This assortment of statistical gloom from various recent sources can be intensified at will by referring back to Robert Thomas Malthus who, in 1798, published his Essay on the Principles of Population, which set out to prove that increase is dependent on warmth and food, and population checks upon the lack of these, or by such positive factors as disease, epidemics, wars, and Follow this by a light dose of Herbert Spencer who, around 1848, speculated that all organic development is a change from homogeneity to heterogeneity Then dip into Oswald Spengler for a review of his belief in the life cycle of each civilization as expounded in his Decline of the West

But don't stop there, gentlemen, for a little contrast in style and content, leap to 1930 with Señor Ortega y Gasset His Revolt of the Masses (W W Norton Co) will bring to your attention the European mass mind and its workings, together with the inwardness thereof and its historical background Ortega y Gasset with no implication of humor says

<sup>1</sup> Harper's Monthly Magazine May 1988

"The Mass Man is he whose life lacks any purpose, and simply goes drifting along And it is this type of man who Hence, at times he decides in our time leaves the impression of a very primitive man suddenly risen in the midst of a very old civili zation In the schools it has been impossible to do more than instruct the masses in the technic of modern life, it has been found im possible to educate them they have been hurnedly inoculated with the pride and power of modern instruments, but not with their spint.

And, was it not Dr Larnest Albert Hooton,

who, in 1940, advised all and sundry how to tell your friends from apes, in a volume (Princeton University Press) entitled Why Men Behave Like Apes and Vice Versal

This brings us nearly up to date with practically no light shed on the question of whether or not we are breeding out intelligence. Perhaps this in itself is a slight indication that the situation is not yet hopeless. With the British Medical Journal, we agree that more study and better methods of study are needed, perhaps, also, some revision of our concept of intelligence. We add this thought for the record

#### Current Editorial Comment

The Physician and the Narcotic Laws The New York State Pharmaceutical Association has issued a handy reference booklet in which are presented the legal requirements pertaining to the prescription of narcotics. This booklet has been mailed to the physicians of the State and the information should prove of great value. The Pharmaceutical Association deserves the appreciation of the doctor for bringing these important matters to his attention.

Excepta Medica. Under this title a new series of abstract journals has been launched in which the world's medical literature will be abstracted in English The publication is an international undertaking of which the central administration has been set up in Amsterdam under the direction of an editorial board of three well known Dutch physicians, and supplemented by a list of specialists representing all parts of the world

Fifteen separate sections of the new venture will be devoted to the various sections of medicine, surgery, and allied fields. These are to be issued at monthly intervals in English and publication is promised to begin late in 1947. The American agents are Williams and Wilkins Company, of Baltimore, from whom further detailed information may be secured.

Ship's Surgeons The New York Times for Friday, June 20, 1947, carries the following headline on page 3 "Ship Surgeons to Choose Union Bargaining Agent" "Surgeons," says the special despatch, "will vote in a collective bargaining election for the first time in history under an order of the National Labor Relations Board to-day." The board ruled that "surgeons employed by the Grace Line, Inc, constitute an appropriate bargaining unit." It ordered an election "to determine whether or not the surgeons desire to be represented by the American Merchant Marine Staff Officers' Association, affiliated with the A. F. L."

This will be interesting to observe The election is ordered Why? Apparently, in all the honorable history of ships' surgeons a union affiliation has not been found necessary

It is not observed or stated that the ships' surgeons desired an election for this purpose Such an election is ordered by the National Labor Relations Board "within ninety days," if we read the despatch correctly Why? And if the ships' surgeons do not choose such an affiliation, what is the alternative?

We seem to recollect an action of the Borough Council of Willesden in England in the recent past which ordered the professional staff of its hospital to join a trade union—or else

After all, it's a small world, isn't it? Apparently full of Boards of Something or Other Boards pushing people around for one or another reason best known to themselves—Ho, hum! Likely, one of these days somebody will push right back—hard

### The President's Page

A WORLD MEDICAL ASSOCIATION is now in the process of organization, the objects of which are as follows

1 To promote closer ties among national medical organizations and among the doctors of the world by personal contact with all other means available

2 To maintain the honor and protect the interests of the medical profession

To study and report on the professional problems which confront the medical profession in the different countries

4 To organize an exchange of information on matters of interest to the medical profession

To establish relations with and to present the views of the medical profession to the World Health Organization, UNESCO, and other appropriate bodies

To assist all peoples of the world to attain the highest possible degree of health

At the present time the national medical associations of the following countries are participating Austria, Australia, Belgium, Canada, Chile, Czechoslovakia, Denmark, Egypt, Eire, France, Great Britain, Hungary, Netherlands, Norway, Palestine, Portugal, Spain, Sweden, Switzerland, and the United States

The final meeting of the Organizing Committee was held in London April 14 and 15, 1947. The Organizing Committee consists of representatives from Belgium, Canada, Czechoslovakia, Egypt, France, Great Britain, Spain, Sweden, Switzerland, and the United States. The first plenary session of the new Association will be held in Paris, September 16 to 20. The Association expects to publish a journal as a medium of exchange of information.

The Association will be organized into a General Assembly to which each participating association will be entitled to send two delegates, and a Council which will consist of the officers and nine elective members. The Council will be the governing body. The Chairman of the Organizing Committee is Dr. T. C. Routley, of Canada. There is a joint Secretariat, consisting of the secretaries of the British and French Medical Associations.

The Organizing Committee at its recent meeting completed a draft of the constitution and bylaws to be submitted to the General Assembly for ratification. It also completed a draft of a questionnaire to be sent to every national medical association. The questionnaire covers a survey of the following subjects in each country professional organizations, present tendencies in medical practice, organization of medical service, conditions of general practice, conditions of consultant and specialist practice, medical services in industry, medical education and medical research, and status of medical practitioner

This new organization has great potentialities. It will afford a mode of reapproachment among the doctors of the world. With the present chaotic state of international affairs, perhaps a beginning of amicable relations can be started by the doctors. They should have no difficulty in getting together as they have one common aim, namely, "to assist all people of the world to attain the highest possible level of health."

Dr Elmer L Henderson, of Louisville, Kentucky, and I attended the meeting of the Organizing Committee in London How close we are to Europe, geographically, was brought home to us by our flight over and back Sixteen hours from New York to London and twenty hours on the return trip

While there we were privileged to inspect the work at two of the largest hospitals in London The editor of the British Medical Journal, Dr Hugh Clegg, entertained us at dinner on our last evening, and at that time we had an opportunity to discuss the New British National Health Act with the chief medical officer of the British Health Ministry and the chief medical officer of the London Hospital Council

Dr Elmer L Henderson and I will attend the plenary session in September as delegates, Dr Roscoe L Sensenich, president-elect of the American Medical Association, Dr Ernest E Irons, Secretary of the Board of Trustees, and Dr James E Paullin, Past-president, will attend as observers

Louis H Bauer, M D. President

#### THE PRACTICAL APPLICATIONS OF ENDOCRINES IN GYNECOLOGY

GEORGE P HECKEL, M D Rochester, New York

In ANY discussion of endocrine therapy it is helpful to have a theoretical argument, for although the important consideration is whether a hormone does or does not work, it is much easier to indicate what to give and when to give it if one proceeds from an hypothesis. Therefore, I shall represent practical endocrine therapy in gynecology as replacement therapy, much as the treatment of diabetes with insulin is replacement therapy. To do this I must review briefly the events associated with the menstrual cycle

The purpose of ovarian function is the production of ova and the preparation of the genital tract for their reception. Ovulation results from stimulation of the primordial follicles of the ovary by genadotrophic hormone of the pituitary Preparation of the uterus for receiving the ovum is brought about by the estrogen produced by the growing follicles in the early part of the cycle and by progesterone from the corpus luteum in the latter part of the cycle. If the ovum is fertilized, progesterone continues to be needed for the protection of the early pregnancy Menstruation occurs if the egg is not fertilized and the corpus luteum does not continue to function

I shall not discuss the gonadotrophic preparations available for treatment for it has never been proved that any of them stimulates the hypofunctioning ovary in which we are interested and some of them, the chorionic, cause degenerative changes in the ovary

The ovarian hormones on the other hand, the estrogens and progestins, induce the same changes in the genital tract which occur normally and as will be seen, there are indications that they may in some way favorably influence the bypophysis

The most obvious deficiency to treat with replacement of hormones is the ovarian failure at the climacteric. It is usually necessary only to give estrogen to relieve the unpleasant symptoms occurring from ovarian insufficiency. At the memopause one should try to relieve the symptoms with as small an amount as possible for it

Presented at the 141st Annual Meeting of the Médical Society of the State of N w York, Buffalo Teaching Day May 6, 1947

is easy to cause bleeding by giving estrogen In younger women with ovarian failure it might be desirable to produce menstruation What can be accomplished with estrogen and progestin in amenorrhea is illustrated in the following case

The patient, H S aged 25 had never had a nor mal menstrual period. Endometrial blopsy yielded nothing but a few opithelial cells even after hielding had been induced a few times by estrogen alone When the patient was given 0.08 mg of ething! estradiol (Esting)\*) duly for two weeks and then progestin 30 mg of Pranone daily for ten days menstruation occurred from apparently normal premonstrual endometrium

Complete replacement therapy of this type is practical, but not useful when it becomes clear, as in this case that nothing beyond periodic bleeding is being accomplished and that the underlying disorder remains unaltered. There are conditions of less complete ovarian failure, how ever, where replacement therapy is indicated to treat abnormal bleeding and where permanent benefit seems to be obtained One of these is metropathia hemorrhagica called aperiodomenorrhen by some because there is complete menstrual irregulanty There are long periods of amenorrhea alternating with periods of prolonged and often profuse bleeding associated with failure of ovulation, persistent follicles in the ovaries, and hyperplasia of the endometrium.

Anovulatory cycles may occur nomally once in a while but there is no upset in the menstrual rhythm because although no corpus luteum is formed, the follicles do not persist. In aperiodomenorrhea the follicles do persist and their continued production of estrogen causes overgrowth of the andometrium. When bleeding does occur it continues because the endometrium is not thrown off completely. Curettage will stop the bouts of bleeding, but one heatnates to recommend it in teen-aged women in whom the condition is frequently seen and I shall show that replacement of progesterone is just as effective and may oven be curative.

Bleeding can be stopped just as effectively with crystalline progesterone in oil 10 mg a day

for five days, or by anhydrohydroxy progesterone (Pranone\*), by mouth, 60 mg daily for five days, as by curettage Bleeding frequently increases for a few days before it stops. Some investigators have reported that the addition of 25 mg of testosterone propionate each day prevents this to some extent

Another patient, A. F, showed what may be accomplished by giving progestin when the patient is not bleeding in an attempt to produce normal men-After giving progestin only to prevent bouts of bleeding when they occurred over a period of seven years, it was used to produce menstruation. since the patient had married in 1944 and wanted to become pregnant Thirty mg of Pranone were given daily from June 22 to July 1, 1945 She bled normally from July 1 to July 9, the first normal flow since 1939 It was planned to repeat this treatment at monthly intervals for five or six months, but it failed to cause bleeding in August and September because she had become pregnant She delivered a normal baby two hundred and seventy-nine days after the artificially produced menstrual period. Similar cases have been ob-The stimulation of a normal served by others cycle by progesterone suggests a beneficial effect on the hypophysis as well as on the endometrium

There are cases which demonstrate that estrogen, as would be expected, is not very beneficial, and that 50 mg of progesterone in one injection may be sufficient to produce bleeding. This hormone is now available in 10-cc vials of oil containing 25 mg per cc.

There are less severe dyscrasias which also may be considered deficiencies according to our hypothesis. Two of these are menorrhagia, excessive flowing at the usual time, and dysmenorrhea. Both with some justification may be considered deficiencies of the corpus luteum. The best argument for this in the case of menorrhagia is the fact that the addition of progestin before the menses is beneficial. As little as 10 mg of Pranone daily for the ten days preceding menstruation may reduce the bleeding to normal.

The argument in the case of dysmenorrhea is a little more involved It is a fact that severe menstrual pains occur only in ovulatory cycles If there is no corpus luteum, there is little or no pain when bleeding occurs, and hence dysmenorrhea may be relieved by preventing the formation of a corpus luteum The most reliable method I know of to relieve dysmenorrhea in any one cycle is the giving of large doses of estrogen, 10,000 rat units of estradiol benzoate, twice weekly during the first half of the cycle, beginning before the fifth day after the onset of menstruation other estrogen of equal potency may be used This can be repeated every other month if need It cannot be done every month, for ovulation cannot be suppressed indefinitely This may be

a useful treatment when a woman wants to do something special when her menses is due, or when it is desirable to give a patient relief occasionally from very severe pain

Progestin given before menstruation may relieve the pain. This is replacement of deficiency of corpus luteum function according to our hypothesis. A deficient corpus luteum is worse than none at all in dysmenorrhea. As little as 10 mg of Pranone each day, beginning a week before the menstruation is expected, may be sufficient. Testosterone, a closely related compound chemically, may do the same. No masculinizing effects need be feared from 30 mg of methyl testosterone daily for the last ten days of the cycle. Ten mg a day, one tablet, may be enough.

Estrogen given before menstruation will relieve dysmenorrhea completely if the patient The dose of 05 to 06 mg of takes enough Estinyl daily (10 to 12 tablets), necessary during a week to ten days before menstruction, causes nausea in a large proportion of patients, and daily injections of 20,000 rat units of estradiol benzoate are impractical This amount of estrogen may postpone menstruation a little and it may prolong bleeding This is unorthodox treatment Estrogen is not supposed to be beneficial in the phase of the corpus luteum I think, in line with the stated hypothesis, that it works through the corpus luteum by maintaining and bolstering it

At this point it will be well to indicate the relative potency of various estrogens Willard Allen standardized them for women, in whom we are most interested Estradiol benzoate is three times as potent as estrone This means that 10,000 rat units of estradiol benzoate are equivalent to 50,000 international units of any preparation standardized with estrone and labeled in international units

The last thing I want to discuss is thyroid, the least expensive hormone of all. There are those who say that it should not be used if hypothyroidism cannot be demonstrated. If this dictum is followed, opportunities for relieving very simply many of the milder menstrual upsets will be missed. A small daily dose of thyroid will do no serious harm and it may do some good. The administration of half a grain of thyroid hormone daily may be followed after a month by a normal menstrual rhythm.

You have noticed that the doses of hormones with the exception of thyroid are relatively large and expensive Smaller amounts are not likely to be effective, however, and prices of the hormones gradually come down as the potencies increase I predict that in a few years we will accomplish more in gynecology by using still larger doses of the ovarian hormones

<sup>•</sup> Eatinyl and Pranone are oral preparations supplied by Schering Corporation, Bloomfield, New Jersey

### FIBROSITIS (MUSCULAR RHEUMATISM) INCLUDING DUPUYTREN S CONTRACTURE A NEW METHOD OF TREATMENT

CHARLES LEROY STEINBERG, M.D., FACP Rochester, New York

(From the Arthritis Clinic Rochester General Hospital)

PRESENT-day practice finds the surgeon busily occupied converting colons into semi colons, the physician occupied in extending the therapeutic uses of the antibiotics, and all of us crusing most people having "theumatic pains," as suffering from hallucinations of pain. The response initiated by the mentioning of the term fibrositis is most varied. However, the usual response is to raise one's cyclrow or to stimulate the nith cramal nerve to protrude the tongue in such a manner that there is an exterior bulge in the side of the face.

There are three schools of thought regarding the diagnosis of primary fibrositis The "liberal school" calls any recurrent ache or pain in soft tissue structure fibrositis Corroborated evidence is the finding of a "bump" which is gleefully referred to as a nodule. The extreme of this liberality was recently reached when Mylechreest1 labeled hermation of fat through a tear in the fascia of the back as fibrositis The interesting newly-discovered cause of one type of backache was confused by such a diagnosis The hermated mass became a nodule and the tear in the fascia became the ache or pain. The "nihilutic school" states that there is no such thing as primary fibrositis The "conservative school" states that there is such a clinical condition as primary fibrositis but that substantiating objective evidence is required Objective evidence and post tive laboratory findings will be described in this article.

The term fibrositis was first coined by Gowers? in 1904. It means inflammation of fibrous tiesue Many rheumatologists use the term as synony mous to any ache or pain of muscle, tendon, liga ment, fascia, periosteum, joint capsule, and nerve sheath Fibrositis associated with some systemic disease is secondary fibrositis. Primary fibroaltis is diagnosed when any of the aforementioned structures are inflamed and there is no associated systemic disease A more fitting defi nition would seem to be "primary fibrositis is a rheumatoid disorder characterized as a metabolic disturbance affecting mesenchymal tissue ' The clinical course pathology, absence of in creased aedimentation rate, normal white blood count, absence of fever, and the response of the

creatinum to tocopherol therapy all point to a metabolic rather than an infectious basis

#### Incidence of Primary Fibrositis

The reported incidence of primary fibrositivaries considerably, depending on whether the writer is on the east shore or west shore of the Atlantic Ocean English writers have reported fibrositis as frequently as 70 per cent of all rheumatic cases seen

TABLE 1.-INCIDENCE OF FIREGETTS

Copeman Hutchinson Savage Schmidt	1940 1942 194 194 1942	70% of rheumatic cases 69% of rheumatic cases 52% of rheumatic cases 55% in a study of miners.	Army hospital Army hospital

American rheumatologats diagnose fibrositiless frequently About 93 000 American soldiers developed rheumatic diseases during the first World War The incidence of primary fibrositis in this group was 5 4 per cent It was the third most common disabling rheumatic disease An analysis of the first 1,000 rheumatic cases seen during World War II at the Army and Navy General Hospital showed the incidence of fibrositis to be 13 4 per cent

TABLE 2.—Incidence of Various Types of Resumation Diseases Seen at Army and Naty Hospital

DISEASES SEEN AT ARMY AND NAVY HOSPITAL			
Rheomatoid arthritis (including rheomatic spondy litis) "Paychogenic rheomatism" Ostocarthritis	33 1% 20% 13 6%		
Fibrositis Rheumatic favor	13 45		
Conorrheel arthritis Cout	1 0%		
Sciatica, ruptured disk, rare joint diseases, ste. Unclassified diseases of joints and related structures	11 17		

The stimulus to diagnose correctly primary fibrositis is initiated when excellent clinicians find it to be a common rheumatic disorder

Fibrositis usually first appears in the latter part of the fourth decade of life and the peak incidence appears in the fifth decade. It is equally common in both sexes Patients may have primary fibrositis on and off for many years and still have the physical appearance of good health Also there is no muscle atrophy present. The disease is practically always chronic and is characterized by remissions and exacerbations. The exacerbation usually comes on as an acute attack and lasts for weeks rather than days. The pain may vary in severity and may be localized or generalized.

Presented at the 141st Annual Meeting of the Medical Sociaty of the State of New York Buffalo, Teaching Day May 6, 1947

tender nodule or may involve one muscle or a group of muscles. The localized muscle areas are not only tender but are usually indurated and are under spasm. The condition is usually associated with generalized staffness. Drafts and cold damp weather aggravate or initiate an attack. Warm weather or the application of local heat bring relief. A slight degree of exercise usually limbers the patient, and an excessive amount of exercise stiffens them again.

Temporary deformities, such as scoliosis of the back or traction of the head to one side, may result owing to marked spasm of muscle structures involved. A careful physical examination may reveal an associated Dupuytren's contracture in the palm of the hand or fibrositis nodules which are firm, subcutaneous tender nodules. These nodules should be differentiated from lipomas which are usually quite soft and often are much larger than fibrositic nodules. The sessile soft discolored nodules of neurofibromatosis usually offer no difficulty in differential diagnosis. Biopsy of the nodules offers conclusive evidence

#### General Laboratory Findings

The white blood count, differential count, and sedimentation rate are normal in primary fibrosi-An increased sedimentation rate in the presence of a diagnosis of primary fibrositis usually means that the diagnosis is incorrect and that one should be on his guard for an early rheumatoid arthritis A most interesting finding is the presence of creatinuria in primary fibrositis books usually state that a normal male adult excretes no creatine in his urine, children during puberty and pregnant women excrete an appreciable quantity Steinberg has previously reported creatine values up to 136 mg per twentyfour hours in normal male adults. Creatinuria of 150 mg or more for a twenty-four hour period has always been found in primary fibrositis by The usual creatine excretion in a twenty-four hour period in primary fibrositis is in the neighborhood of 300 to 400 mg Some of these patients excrete even larger quantities The creatinum usually responds to tocopherol therapy The usual response is one of gradual reduction of creatine excretion while under such therapy

Occasionally, however, the opposite occurs There is an increased urmary creatine excretion under tocopherol therapy. Also, at times the creatine excretion diminishes during the first few weeks of treatment and then begins to rise and continues to do this unless the dose of tocopherol is increased. These various responses are found in experimental animals in whom nutritional muscular dystrophy has been produced with a vitamin E deficient diet. The giving of tocopherols to these animals with nutritional

muscular dystrophy usually results in a decrease of creatine excretion in the urine. However, at times the creatine excretion rises and at times it drops initially, only to rise unless the dose is increased. The biochemical factors concerned with these variations are unknown at the present time.

Vitamin E can be determined accurately in a blood plasma by the method of Quaife and Harris 5 They found the blood plasma levels of tocopherols to be between 0 9 and 1 6 mg per 100 cc, with an average of 12 mg in a series of healthy human individuals Steinberg4 has found the vitamin E blood level in primary fibrositis to be normal in 27 cases vitamin E level was found to be low in 3 cases Two of these individuals had notoriously inadequate diets One case had cirrhosis of the liver, this has been found to interfere with the absorption of vitamin E from the gastrointestinal tract The lowest vitamin E blood level of these 3 cases was 0.75 mg per cent The lowest vitamin E blood level found in a controlled series of study in which the patient had marked portal cirrhosis of the hver was 0 36 mg per cent In a study of 50 cases of secondary fibrositis, the vitamin E blood level was found to be normal

Several conclusions might be determined from these studies (1) The diet of patients suffering from primary fibrositis usually contains normal quantities of vitamin E (2) The absorption of vitamin E from the gastrointestinal tract is normal in primary fibrositis unless interfered with by extreme liver damage (3) Although the vitamin E intake is sufficient and the absorption from the gastrointestinal tract adequate, the ability of the muscle structure to utilize vitamin E is disturbed Corroborating evidence of this difficulty may be obtained by vitamin E utiliza-If normal healthy individuals are tion curves given a single large dose of 1,500 mg of vitamin E and then blood levels of vitamin E determined at two-hour intervals during a twelve-hour period and repeated the following morning, a "peak" curve is obtained However, the blood level in primary fibrositis tends to rise more slowly and then tends to flatten out In other words, a plateau curve is obtained A low vitamin E blood curve is obtained in patients in whom absorption of vitamin E from the gastrointestinal tract is inadequate

A deterrent in the correct diagnosis of primary fibrositis has been paucity of gross or microscopic tissue studies. The writer previously has described the microscopic pathology of biopsied sections of muscles in patients suffering from primary fibrositis. These changes consisted of areas of muscle degeneration with loss of cross striations and disappearance of nuclei. Other sections have shown active fibroblastic activity and also round-cell infiltration. The blood

vitamin E level in these previously reported cases was normal. The creatine excretion was excessive and the creatinuma responded to tocopherol therapy.

A white man aged 50 was seen recently who gave a sixteen year history of aches and pains in various soft tissue structures of the body nation revealed poor muscular tonicity of the entire body, particularly noticeable in the biceps of both arms The initial blood vitamin E level was 0 70 mg. per cent, which is definitely reduced The vitamin A was 210 units per cent and the carotene was 192 gamma per cent. A biopsy of the biceps muscle revealed occasional degeneration of muscle fiber with abnormal arrangement of the nuclei occasional muscle giant cell was noticed areas of lymphocytic infiltrations were present. Similar findings have been described by Goettsch and Pappenheimer in E-deficient guinea pigs and rabbits.7 This patient was placed on 300 mg of mixed natural tocopherols daily. After two weeks of such therapy the blood vitamin E rose to 0 91 mg per cont, vitamin A 216 units per cent and the carotene was 160 gamma per cent. A repeat biops: was done four weeks after the initial biopsy findings were somewhat improved over the previous The muscle fibers were swellen homogencous, and the striations, while present were faint. There was slight peripheration of nuclei No round cell infiltration was noticed There was marked clinical improvement in this patient case 15 of unusual interest in that it represents a patient with muscle disease in whom the original blood vitamin E level was low owing to insufficient intake of the vitamin The clinical response at the end of the four weeks' treatment was very marked The patient was practically free from all aches and pains although the anatomic changes were only alightly improved

Dupuytren's contracture is a form of primary fibrositis. The usual pathologic picture is one of dense fibroblastic tissue which squeezes out the fat and deeper structures of the skin and dips down to surround the flexor tendons of the fingers. Thus, it produces contracture of the flexors of the fingers. The tissue is more cellular and vascular in the earlier stages. There is associated sclero-derma of the skin as evidenced by thickening of the cornified layer thinning and flattening of the stratum mucosum and obliteration of the corium which normally extends deep into the epidermis

#### Differential Diagnosis of Primary Fibrositis

The most difficult problem that arises in the diagnosis of primary fibrositis is its differentiation from psychogenic rheumatism. One of the most practical tests to employ is the "sedative" test. This consists of giving the patient phenobarbital in a doee of 16 mg three times daily. The patient with primary fibrositis is not benefited but the patient with psychogenic rheumatism is re-

heved of his or her symptoms Creatinums is a common finding of primary fibrositis and is absent in psychogenic rheumatism The patient with primary fibrositis is cooperative and objective in his viewpoint whereas the patient with psychogenic rheumatism is tense, anxious, defensive, antagonistic, and subjective in his viewpoint The patient with primary fibrositis is able to localize the joint and muscle symptoms to a definite area or areas. The patient with psychogenic rheumatism "can't quite describe it" He usually places his hand over his entire anatomy rather than localizing to a particular area. The patient with primary fibrositis complains of aching soreness stiffness, fatigue. The patient with psychogenic rheumatism complains of burn ing tightness, weakness, numbress, tingling queer, or tired sensation

The patient with psychogenic rheumatism has "misery" all the time The patient with primary fibrositis usually has a definite pattern of pain He is stiff in the morning on arising, loosens up during the early part of the day, and stiffens as the day goes on Physical exertion aggravates the symptoms of primary fibrositis In other words the stimulus is external. The stimulus in psychogenic rheumatism is internal the or she is in conflict with themselves and with their environment Mental preoccupation gives very little if any relief to patients with primary fibrositis but often relieves the patient with psychogenic rheumatism If the latter individual can occupy himself at playing cards or having one or two high balls, he or she feels fine This is not true with primary fibrositis Heat usually relieves patients with primary fibroaitis and aggravates patients with psychogenic rheumatism. Aspirin relieves primary fibrositis but is usually ineffective with nationts with psychogenic rhoumatism same is true of physical therapy, it produces temporary relief from fibrositis but makes the pa tient with psychogenic rheumatism worse of the most outstanding differential points is that patients with psychogenic rheumatism have bisarre symptoms such as headaches sighing respirations, precordial pain, insomnia nervousness tremor etc

The nodules associated with other diseases and conditions should not cause too much difficulty. It has been stated previously that the so-called lumps of lipoma are usually soft and are not tender. The nodules of neurofibromatosis are soft and discolored. The nodules associated with rheumatoid arthritis are usually quite large and are not as deeply buried in the subcutaneous fusue as these of primary fibrosits. Occasion ally hemangioma may be confused with a fibrosi tie nodule. Also herniation of the fat through the fascia in the back may do likewise. No

creatinuria is present in any of the latter conditions

#### Treatment of Primary Fibrositis

Various methods have been employed for the treatment of primary fibrositis Krusen has advised muscle massage with a circular movement in order to "rub out the nodules" Slocumb has previously used "fibrositic vaccine" Kelly has described a reflex pain originating from the myalgic lesion in primary fibrositis 10, 11 He,10 with Pugh and Christie, 12 has advocated finding trigger points and injecting these with procaine solution with temporary to permanent relief in various cases Removal of foci of infection has been tried

It is difficult to understand how the infectious theory has entered into the treatment of primary fibrositis as the condition definitely is not asso-An increased sedimentaciated with infection tion rate or elevated white blood count usually means some other disease, usually rheumatoid arthritis Also, it is difficult to understand how deep massage, that is, rubbing an area of inflammation, can possibly cure the condition The trigger point injection with procaine solution is intriguing, but at the best it is usually a temporary and not a permanent expedient

The close similarity of the pathologic picture found in primary fibrositis and in that found in nutritional muscular dystrophy stimulated me to try vitamin E in the treatment of primary fibrosi-The results with this treatment were first reported in 1941 The usual average dose has been found to be 300 mg of mixed natural tocopherols, of which 60 per cent is in the form of alpha tocopherol which is given in equally divided doses daily Clinical response is usually obtained in a period of two to four weeks of such treatment Objective evidence of the success of such treatment has been found in Dupuytren's contracture Clinical cure in patients having a history of Dupuytren's contracture up to one year has appeared as early as after four weeks' Marked improvement occurred in a physician who had Dupuytren's contracture for at least thirty years, nine months' treatment was required in order to bring about his improvement, although complete clinical cure was not ob-It was meffective in a patient having tained Dupuytren's contracture associated with portal cirrhosis It has been shown that the blood vitamin E level is low and that large doses of vitamin E are not absorbed in these cases haps, the giving of bile salts along with vitamin E might bring about clinical improvement in such a case

A maintenance dose of 1 mg of mixed natural tocopherols per kilo of body weight has been suggested in order to prevent recurrence of the con-It has been found that patients who stop tocopherol therapy have a recurrence of Dupuytren's contracture or fibrositis in a period of several months after its cessation Some patients require larger maintenance doses, necessitating a total dose of 150 to 300 mg daily in order to prevent recurrence. It is these factors that suggest that the normal metabolism of the muscle for vitamin E is in some way disturbed and that its disturbance is not due entirely to insufficient intake or to a disturbance in absorption from the gastrointestinal tract Recurrence of Dupuytren's contracture after surgery is common suggested that mixed natural tocopherols be given in a dose of 100 mg three times daily preceding or following such surgery in order to prevent recurrence

#### Conclusion

- Primary fibrositis is a metabolic disorder resulting in disturbance of mesenchymal tissue function
- 2 The blood vitamin E level in primary fibrositis is usually normal The only exceptions found to date are a woefully madequate diet or liver disease which prevents absorption of the vitamin E from the gastrointestinal tract
- It is possible that what is called primary fibrositis divides itself into two clinical states An absence of a coenzyme or enzyme factor necessary for muscle or connective tissue to properly utilize vitamin E could explain the situation Changes in these tissues actually may be due to an insufficient amount of vitamin E in the diet
- 4 Creatinuria is a common finding in primary fibrositis
- 5 Dupuytren's contracture is a form of primary fibrositis which is remedied by tocopherol It may be used as a sole method of treatment in early cases of Dupuytren's contracture and may be used associated with surgery in the more chronic cases
- Continued biologic and chemical studies are indicated in the field of muscle metabolism More chemical and pathologic studies will aid in the clearing up of the various states which are now called primary fibrositis

#### RECENT DEVELOPMENTS IN THE CARE OF PROSTATIC DISORDERS

JOHN E HISLIN, M D Albany, New York

(From the Albany Hospital)

UROLOGY, along with other branches of medicine, has achieved rather marked ad vances in therapy and procedures during recent years. We who have practiced for two or three decades marvel at the improvements in the handling of diseases of the prostate, especially the relief of prostatic obstruction.

The subject is too great and time will not allow a complete discussion of all phases of the subject. Much of it will be a review along with the opinion of the author and his associates as to the present status of these developments. For brevity and clarity the subject will be discussed under the following classification

- 1 Urmary Antiseptics in Prostatic Diseases
  - Operative Procedures
    - a. Pre- and postoperative care
    - b Anesthesis
    - c. Operations
    - d Hemostatic agents
- 3 Hormone Therapy

#### Urinary Antiseptics

Sulfonamides, pencillin, and streptomycin have verified the statement made a few years ago that the greatest advance in medicine would be through chemistry and allied sciences Their value in urinary tract infections, including infections associated with prostate pathology cannot be measured Their efficiency is so great that there is a tendency to prescribe them in all types of infections without determining the organism involved or associated obstructions, residual urine stones, or abscess formation. The fact that all organisms are not affected by any one of these drugs, the danger of toxic symptoms and complications, and the question of the organism becoming resistant to the drugs make their indiscriminate use a definite hazard to the patient.

The Sulfonamides—Because of their elimination through the urmary tract, these allow smaller desage, thus adding to their efficiency in such infections. Colon bacillus infections, the most common type found in the urinary tract infections, react to these drugs. They are now in our experience, rarely effective in gonococcus infections. We have found that when one of the drugs is not effective another may give excellent results. Large amounts of fluid and alkalinization will prevent complications in most cases.

Sulfadiazme, sulfathiazole, sulfacetimide and

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo, Tesshing Day May 8, 1047 sulfamerazine are the most common types of sulfonamides. We prefer sulfathlasele because of its ready absorption and lessened tendency to form crystals in the urine Sulfamerasine would appear to be less toxic and smaller doses are effective.

Mandelamme —A combination of mandelic acid and methenamine, this is quite efficient in colon bacillus infections, it has replaced simple methenamine long-used by many doctors

Pencillin—This new addition to our list of antiseptics is potent at the present time in gonorheal infections. In nonspecific prostatitis due to staphylococcus and mixed infections it seems to be of benefit, along with local treatment. Its administration has been made easier with the development of oral and the slowly absorbed becever a preparations.

Streptomyen — This preparation is effective in gram-negative bacillary infections as well as those due to gram-positive cocci including the nonhemolytic streptococcus. Although experience is limited, most workers stress the importance of delaying treatment until the species of the bacteria is isolated and its sensitivity to streptomyen tested. Keefer and others also warn of its probable failure in infections associated with stone and obstruction. There is, apparently, a great tendency to permanent drug resistance when small doses are given.

Because of the structure of the prostate gland, we cannot expect deep and walled-off infections to be completely eradicated with drug therapy. We still must rely upon such time-hothored procedures as removal of foci of infection, prostatio massage, urethral dilatation, irrigations, deep instillations, hot rectal irrigations, dlathermy, and endoscopic treatments to effect the control of the infection.

The above-mentioned preparations have also contributed much to the pre- and postoperative care of operative cases. Hinman has stated that, "The dangers of proscrastination grow greater and greater as urinary antiseptics grow better and better" With this in mind we must investigate our cases of infection that do not respond or recur checking the residual urine, prostatic expression, and x raying for stones. With correction of complicating factors not only will our antiseptics be more efficient but renal tissue will be conserved

#### Operative Procedures

Pre- and Postoperatus Care -The preoperative

care of the prostatic patient formed one of the cornerstones in the foundation of urology The attainment of proper renal function before removal of the prostate is about as important now as then—no matter what type of procedure is carried out

To this fundamental procedure have been added the urinary antiseptics, referred to above, and the use of transfusions, not as a lifesaving procedure but for restoring the blood picture to normal so that the patient will better withstand surgery and, most important, possible complications Vitamins, amigens, plus drainage, fluids, blood, and antiseptics usually will place the poorest surgical risk in condition so that he can be relieved safely by modern surgical procedures

Probably the most important development in postoperative care in urology, or other branches of surgery, is the early ambulation of the patient. The great value of this was noted by urologists in the postoperative care of patients subjected to prostatic resection. This procedure made possible the early ambulation of these elderly men and this constituted a major part in affording relief to many who could not be operated on otherwise.

Bed exercise adapted to the individual case is another lesson taught by the late war and probably not used as widely as it should be

Slotkin advocates the use of ascorbic acid, 25-mg doses four times daily, postoperatively, in cases showing evidence of pulmonary complications in this prostatic age group <sup>1</sup> Since using this drug in patients who show moisture in the lungs, rise in temperature, and respiratory rate, he has noted rapid and startling results with reduction of temperature, cough, and expectoration

Prevention of fatal emboli by saphenous ligation in cases presenting phlebitis has been developed recently and is used extensively, especially by the group at the Massachusetts General Hospital

Colby reported in October, 1946, that 1,500 vein ligations had been carried out at that institution to prevent emboli <sup>2</sup> In 1939 and 1940, before ligations were performed, there was a 6 per cent incidence of thrombosis or emboli following prostatic surgery and fatal emboli in nearly 3 per cent. During the years of 1943 and 1944, among the same class of patients treated with early ambulation, there was a 2 per cent incidence of thrombosis or emboli and a 0.9 per cent mortality from emboli. With the use of prophylactic vein interruption or anticoagulants there had been no fatal emboli for the past year.

Colby states that tenderness in either calf muscle in a postoperative patient is sufficient evidence of venous thrombosis or of early pulmonary infarct <sup>3</sup>

Anesthesia - The development of departments

of anesthesia, a rather recent event and still not available in a large number of hospitals, has been one of the most important and valuable factors in the surgical handling of prostatic disease

The judgment of the trained anesthetist, after surveying the patient and considering the surgery contemplated, in prescribing and carrying out the proper anesthetic is of the greatest value in this particular age group. Their recognition and prophylactic care of respiratory complications are dramatic and may mean much to the poor-risk patient.

Spinal anesthesia, although not a recent development, now entails new technics, it seems ideal in prostatic surgery where high abdominal anesthesia is not required and where immediate postoperative local comfort is desired in patients, especially in those with cardiac complications. It is used routinely in our resection work and the anesthetic, with the skill of the Deptarment of Anesthesia, plays a good part in the low mortality achieved.

Pentothal sodium, for short anesthesia or a basal anesthetic, is favored by many operators and anesthetists. Although widely used in offices and hospitals with apparently little regard for possible disaster, most anesthetists consider it a drug requiring great care in administration because of its depressing respiratory effect. The immediate availability of resuscitation equipment, when pentothal sodium is used, also is advocated

Etsten and Himwich recently have described states and signs of pentothal anesthesia upon a physiologic basis <sup>4</sup> These were based upon studies of brain metabolism during pentothal anesthesia

Combined with nitrous oxide, patients can be carried very lightly and in cystoscopy, where later cooperation of the patient is necessary in making pyelograms, it is most useful

Pentothal sodium is very pleasant and patients like it—For short procedures and under proper circumstances, it seems an ideal anesthetic

Caudal anesthesia, using 1 per cent metycaine, is an ideal anesthesic for use in men when complete and time-consuming cystoscopy is necessary Continuous caudal, as used in obstetrics, has been used in prostatic surgery as reported by Davis and Lee <sup>5</sup> It is felt that it would have no advantage over low spinal anesthesia in such work

Operations—Suprapubic Prostatectomy For the removal of the enlarged prostate, in one or two stages, this has been the procedure of choice for most general surgeons and urologists for many years. It has stood the test of time as not too difficult an operation and one giving excellent functional results

However, the long hospital stay, the often slow

closure of the sinus, the occurrence of emboli the inability to deal with malignancy, the associated discomfort, and the high mortality in poor risks were some of the disadvantages noted

Improved urinary antiseptics anesthesia, and general preparation of the patient have reduced the operation to more frequent one-stage affairs, lessening the hospital stay. The closure of the capsule, improved hemostatic bags, and agents which allow earlier removal of the suprapulate tube and more prompt closure of the sinus have led to earlier discharges.

Early ambulation, vein ligation, and other postoperative aids have reduced mortality hospital stay, and discomfort. Series are now reported in which the patient is discharged on the fourteenth to twenty-first day and mortality is reduced to between 5 per cent and 10 per cent.

Millin, of London, reports a new retropuble and retrovesical prostatectomy which he claims has advantages over the intravesical enucleation \*

Suprapuble prostatectomy in one or two stages with the employment of the newer pre- and post-operative care, is still one of our best urologic operations, since it gives more certain results when used by those surgeons not skilled in the other procedure

Permeal Prostatectomy This operation devel oped by Young, with modifications by Loweley and others, although less frequently used, is probably the most surgical of all procedures for blad der neck obstruction

Through a perineal exposure of the gland, suspicious areas can be biopsied and if found to be malignant the radical perineal operation can be carried out. New developments in this operation have to do with the technic whereby the danger of incontinence is lessened and the veruinontanium preserved. Lowsley plicates the membranous urethra with a mattress suture of ribbon-gut to further lessen the frequency of this complication and has developed an operation for incontinence based upon that method

Belt has modified the perineal approach by utilizing a plane of cleavage near the rectum and claims it to result in ease of exposure and less involvement of blood yessels.

Radical Perneal Prostatectomy for Carcinoma of the Prostate Young developed this operation for the oure of carcinoma of the prostate As the name implies it is radical, with removal of half of the trigone internal sphincter, the entire prostate gland including the seminal vesicles, and a part of the membranous urethra.

With this extensive surgery he reported a low mortality and with improved technic complete urnary control in almost every case. The operation requires considerable skill and experience in order to achieve not only good functional results but also complete removal of the carcinoma which is the real reason for such an extensive operation

The indications for the operation as a curative procedure are limited due to the fact that car cinoma of the prostate may be present for a con siderable period of time without symptoms and with early invasion of the perineural routes of the pelvis, the sacrum, the lumbar vertebrae and femur

These make early diagnosis most difficult and again emphasize the great importance of rou tine rectal examinations in men. An early nodule biopsy, and radical perineal prostatectomy may produce a cure so seldom presented at present

Colston, discussing this operation, states that Young performed it upon only 87 patients from 1904 to 1939. He found that in only 5 per cent of cases extension had not taken place and Lowsley reports that in less than 5 per cent of his series metastases had not occurred and cure might be attained

Thompson and Emmett state that postmortem studies by several investigators showed extension beyond the confines of the gland in cases in which the primary lesion was very small

Scott and Parlow have suggested the use of this procedure in late cases after control of the local disease and metastases has been obtained with estrogonic therapy. 10 This combination may provide another indication for the radical operation

The greatest hope of effecting a cure apparently lies in the discovery of an early nodule by routine rectal examination before symptoms, biopsy, and radical perineal prostatectomy. The few cases meeting these conditions should not deter us in our efforts to cure prostatic careinoma surgically as is done in carcinoma involving other organs.

Transurethral Resection of the Prostate or Transurethral Prostatectomy This procedure has changed the entire picture of the surgical care of prostatic obstruction. From its early indication in fibrous bars, contracture of the vesical neck, and small median and lateral lobe obstruction, it has developed to the point where, in many clinics it is the only procedure used in relieving obstruction in beingn conditions. A review of the prostatic surgery in any large urologic service reveals an increasing percentage of resections.

Some modifications of the original Stern McCarthy resectoscope have been made by Nesbit and others but the wider use of the instrument has been due to increased skill in its use. With sufficient skill it is possible to remove the prostate as completely as in the usual suprapulor and permeal operations. Without adequate skill the removal of large glands should not be attempted for the poor results and serious complications are not fair to the patient or the operation

It is still a question in the minds of many as to whether the handling of all types of benign obstruction by any one procedure is proper or possible. It is our opinion that except for the very early case of carcinoma, where the lesion is apparently limited to the gland, the transurethral operation, in skilled hands, is the procedure of choice. With all types of removal, except in the radical operation, recurrences will develop in a small percentage of cases. Carcinoma developing following this operation appears to be no more frequent than in suprapubic and permeal prostatectomies.

In obstruction due to carcinoma of the prostate, with extension and metastases, it gives relief in the simplest manner Combined with immediate or later orchiectomy and estrogenic therapy, we are giving the patient, with little risk or discomfort and a short hospital stay, the utmost in palliative treatment

Prostatic calculi, so frequently a complicating factor in prostatic infections and making eradication of infection most difficult, can be removed satisfactorily by the transurethral approach.

Dr William A Milner in the Section on Urology\* will report his results in transurethral prostatectomy in patients eighty years of age and over. One hundred and eighty-one patients were relieved of obstruction during the past five years, with eleven deaths, a mortality rate of 6 1 per cent as compared with a rate of about 2 per cent for the entire series over a five-year period. Ten deaths occurred during two years. The causes of death were cardiac, five, pneumonia, five, unknown, one

No longer is age a factor in the contraindications for this operation. Rarely is physical condition such that the patient cannot undergo this procedure. The comfort afforded these elderly men for their remaining few years makes the operation a most humane and satisfactory procedure

Hemostatic Agents in Prostatic Surgery Hemostatic catheters, such as developed by Foley and Hendrickson have made possible, to some extent, the excellent results attained in transurethral surgery. In suprapulic prostatectomy they also have a place and allow a shorter period of suprapulic drainage

The development of nonremovable substances for the control of hemorrage has been of great value in prostatic surgery

Thrombin (topical) in solution and upon gauze to be removed was one of the early products. Fibrin foam and gelatin sponge are used in prostatic operations. Quinby has had satisfactory experience with these latter preparations. Fish has reported upon the use of ovidized cellulose, an absorbable hemostatic gauze.

There is apparently little tissue reaction and it was efficient in the control of hemorrhage following prostatectomy. Elimination of the pain associated with the removal of gauze and the occasional case of secondary hemorrhage following such removal are other advantages in the use of oxidized cellulose.

#### Hormone Therapy

Hormonal Treatment of Benign Prostatic Hypertrophy—The relationship of endocrines and prostatic hyperplasia has for many years attracted the attention of investigators. Its development with advancing years would suggest that it has some possible association with testicular secretion. However, experiments have shown no definite evidence of such relationship

There have been reports of clinical improvement of symptoms associated with prostatism which were effected by the administration of male hormones, but there has been no definite demonstration of a change in the size of the gland Many patients feel better physically and mentally and there may be improvement in the urinary stream. Hamilton, Heslin, and Gilbert attribute this to improved muscular tone. 13

The effect of female hormone upon prostatic hyperplasia has been studied by Kahle in 1940,14 and Hamilton et al in 1936,13 among others Kahle concluded that the hypertrophied glands were reduced in size with some alleviation of symptoms after the administration of stilbestrol our studies an attempt was made to confirm Lower's contention that 49 out of 76 patients were benefited by inhibiting the pituitary with injections of testicular substance Since the administration of female sex hormone results in definite inhibition of the pituitary, this preparation There were no striking improvements which might be expected if Lower's contention One patient did show relief of some symptoms but the size of the gland remained the same

Carroll, in a recent review of the literature on the effects of endocrines upon hyperplasia, states that, "It would appear that true hyperplasia of the prostate gland has not been produced by endocrine therapy or accelerated by endocrine therapy" He found no proof that endocrines had any effect upon the normal, adult prostate gland

Lowsley and Kirwin, in their textbook, state that the subject is still in an experimental stage and further laboratory and clinical studies must accumulate to determine the true place such therapy has in benign prostatic disease <sup>16</sup>

Hormone Treatment in Carcinoma of the Prostate Gland—Unlike the questionable position of endocrine therapy in benign hyperplasia of the gland,

<sup>\*</sup>To be published in a later issue of the JOURNAL.

effects of such therapy in carcinoms has produced the newest, the most dramatic, and most publeased development in the treatment of prostatic disease

As a palliative measure it has brought about miraculous results in the relief of pain and although the hopes of it being a cure have van ished, the relief afforded those affilieted with the disease has earned for itself a high place in the humane achievements of science.

Huggins and his coworkers are responsible for the clinical application of research on the effect of androgens and estrogens upon acid phosphatase in proetatic carcinoma.<sup>17</sup>

Kutscher and Wolbergs are mentioned by Lowslev and Kirwin as having observed high concentration of serum and phosphatase manifesting its optimum activity between a pH of 45 and 6 <sup>18</sup>. This ensyme activity apparently is elaborated by the prostatic epithelium and increases from a small amount in infancy and childhood to high levels in the adult. It also is found in the blood stream and quantitatively determined by several methods. The so-called King Armstrong method is a popular one and the normal is given as 40 units per 100 cc. of blood.

The Gutmans found a large amount of this scrum add phosphatase in carenomatous tissue of the prostate and in the metastases and blood scrum. This finding is of value in the differential diagnous between bony metastases of carcinoma and Paget's disease, as well as being an aidd in the early diagnosis of prostatic carcinoma.

Elevated blood levels of serum and phosphatase occur only in carcinoma of the prostate with metastases, but such metastases may be observed without elevated levels. Sarum alkaline phosphatase levels may indicate the activity associated with the healing of bone lesions due to carcinoma of the prostate.

Huggins in his original work presented evidence of the concept that carcinoms of the prostate is composed of epithelial cells of a mature type which, in common with all other types of adult prostatic epithelium is responsive to depression of the levels of androgenic hormones. This sensitivity of prostatic carcinoma to androgen levels was shown by the change in serum acid phosphatase levels by the use of androgens. Injections of male hormone increased acid serum phosphatase, and female hormone, by decreasing amount of male hormone, caused a lowering of acid phosphatase.

Huggins felt that custration, to secure a quicker, more complete removal of the undrogens, was a more satisfactory method than the use of formale hormone. In May, 1941, he selected several cases of advanced carcinoma of the prostate with metastases and noted after castration increased appetite and gain in weight, an elevation in hemo-

globin, decreased pain, decrease in size of prostate gland, and stabilisation or regression of bony metastases

Munger at the same time reported his experiences with irradiation of the testicles in the treatment of carcinoma of the prostate <sup>11</sup> His object was also the elimination of male hormone from the testes

Six years have proved the correctness of Huggins' contribution, and hormone therapy is standard treatment for prostatic carcinoma and its metastages.

The method of control of male hormone varies in different clinics, as follows (1) estrogens alone and later orchiectomy, (2) orchiectomy and later estrogens, (3) the two methods combined

Experience would indicate that in either manner of reducing the androgens they cannot be controlled indefinitely at the present time. When one method fails it is unusual for the other method to be effective, although it is our feeling that orchiectomy is more apt to give further relief when estrogens fail than the use of estrogens after orchiectomy has failed. It was felt that the adrenal gland might be a source of supply of the androgens influencing these late results of hormone therapy.

Huggins reported the results of bilateral adrenalectomy in prostatic cases where recurrence after orchiectomy had taken place." Two patients died soon after the operation because of insuffi ment substitute therapy, one patient lived 116 days and showed a reduction in the excretion of 17 ketosteroids in the urine, but the growth of the prostatic carcinoma was not entirely inhibited although retarded. He concluded that it was not a practical method of treating prostatic carcinoma He also believed that the excellent results after orchiectomy depend upon a type of carcinoma which is androgen-dependent, and upon testicles which are producing a large amount of androgen. In some there is an extragonadal production of androgen when estrogen therapy will be necessary In the poor results after orchiectomy he believes we are dealing with a type of carcinoma classed as androgen-independent.

The time of use of orchiectomy in prostatic carcinoma may be most important. In a series of 112 cases, in which complete follow-up was possible, we were greatly pleased in 78 cases with the results of orchiectomy performed at the time diagnosis was made and resection performed Huggins was, until recently at least, doing routine orchiectomy in all cases

I believe that most clinics including our own now do orchiectomy only when metastases are present with pain and elevation of and serum phosphatase. Whether the therapy has some prophylactic action delaying metastases or

1946

whether its later use may give a longer regression of the symptoms has not been determined

Hormone therapy apparently will not cure carcinoma of the prostate, but it does provide a means of affording great relief and prolonging the lives of our patients, which is, after all, one of our most important duties in the practice of medicine

#### NEW STATE COMMISSIONER OF HEALTH APPOINTED

Gov Thomas E Dewey on June 28 appointed Assistant Surgeon General Herman E Hilleboe, who has been associate chief of the Bureau of State Services of the United States Public Health Service, as Commissioner of the Department of Health of the State of New York Dr Hilleboe succeeds Dr Edward S Godfrey, Jr, who retired recently

Dr Hilleboe's appointment became effective Shortly after assuming his new office he was scheduled to leave for a three-week tour of Europe, to study health and tuberculosis problems on that continent and attend three international health meetings

Dr Hilleboe was born in West Hope, North Dakota, January 8, 1906, and received his elementaryschool and high-school training in Minnesota He received the degrees of Bachelor of Science and Bachelor of Medicine at the University of Minnesota in 1929 He received the degree of Doctor of Medicine from the University of Minnesota Medical School in 1931

He had graduate training in Pediatrics at the University of Minnesota Hospitals at Minneapolis and in public health at the Johns Hopkins School of Hygiene and Public Health, from which he received the degree of Master of Public Health ın 1935

After graduation from medical school, Dr Hilleboe engaged in rural general practice in Swanville, Minnesota Since 1935 he has spent full time in public health work, specializing in tuberculosis con-

In June, 1939, he was appointed as a senior assistant surgeon in the regular corps of the Public Early in 1939, he made special Health Service studies for the Public Health Service in tuberuclosis control in the Scandinavian countries, England

Germany and France

Huggins C

Dr Hilleboe served with the Minnesota Division of Social Welfare in St Paul, Minnesota, as chief of the Medical Unit from 1939 to 1942, on loan from the Public Health Service Since 1942 he has been in charge of tuberculosis control activities in the Public Health Service in Washington, DC On July 1, 1944, he was appointed chief of the Tuberculosis Control Division of the Public Health Service with the rank of medical director On November 1, 1946, he was appointed associate chief of the Bureau of State Services of the US Public Health Service, with the rank of assistant surgeon general

Dr Hilleboe is a member of the Board of Directors of the National Tuberculosis Association, member of the Council of the American Trudeau Society, and member of the Board of Regents of the American College of Chest Physicians He also is professorial lecturer in Tuberculosis at the George Washington College of Chest Physicians University Medical School, Washington, DC, and adjunct professor of medicine, Georgetown University

Dr Hilleboe was appointed by the National Tu berculosis Association on March 10, 1947, as a representative on the Council of the International Union Against Tuberculosis On May 31, 1947, he was appointed as the American member of the Expert Committee on Tuberculosis Against Tuberculosis mittee on Tuberculosis of the World Health Organization, Interim.

Dr Hilleboe has over 60 publications in the medical and public health literature published from 1931 to 1947 He is coauthor with Dr Russell H Morgan, professor of radiology at Johns Hopkins Medical School, of the book, "Mass Radiography of the Chest," published in 1945

#### THERAPEUTIC APPLICATIONS OF CURARE AND THEIR PHYSIO LOGIC IMPLICATIONS\*

EDWARD B SCHLESINGER, M.D., New York City

(From the Neurological Institute)

HE clinical use of curare is based on its ability L to create a transient block to neuromuscular transmission at the myoneural function eral properties have been recognized for more than one hundred years As early as 1833 John Morgan<sup>1</sup> of London demonstrated its usefulness in ameliorating the convulsive phenomena of both strychnine and tetanus in animals However since the source of supply was so unpredictable and the active agent poorly understood, the drug has remained until recently an experimental rather than a therapeutic tool In recent years important steps have been taken in isolating and identifying a crystalline derivative of the crude alkaloid with predictable properties and to acity

Tubocurarine is now known to be a quaternary ammonium salt. These salts as a group have the property of paralyzing conduction at the myoneural junction Tubocurarine, uniquely, in certain concentrations has an almost pure myoneural junction effect. This property is of great clinical significance, and because of its physiologic and therapeutic implications it is worthy of am philication This neuromuscular block is similar or identical with a phenomenon seen in the expenmental laboratory If the motor nerve to a muscle is stimulated, the muscle responds by a contraction As the frequency of stumulation rises, the rate of muscle response increases with it A point is reached at which stimuli no longer seem to excite the muscle which remains relaxed spite of this, the nerve-will still conduct and the muscle still respond to direct stimulation block appears to occur at some point between nerve and muscle, the myoneuml junction the frequency of stimulation of the nerve is now dropped alightly the muscle will again contract vigorously This neuromuscular block at critical frequencies of stimulation is known as the Wedensky inhibition Its exact nature represents one of the key mysteries of neurophysiology

Curare creates a like inhibition fortunately at frequencies which are lower and of clinical significance. The importance of this lies in its thera peutic applicability to many abnormalities of the neuromuscular system. Simplified to the utmost, these pathologic states, in part, resolve themselves

into alterations in the frequency and duration of impulse bombardment at the my oneural junction By maintaining certain concentrations of curare it is possible to create a differential block at the function and in effect filter the abnormal volleys At the same time lower rates of bombardment characteristic of voluntary innervation are still capable of initiating a muscle response. The Wedensky effect depends upon the maintenance of critically high frequencies. For an equally efficient therapeutic block with curare, it is likewise imperative that the entity under treatment be characterized by a relatively rapid or prolonged hombardment of the myoneural junction The entire rationale of treatment is based upon this concept and understanding it one can predict therapeutic response in a given syndrome

Success then does not imply paralysis of the myonoural junction but a differential blocking of abnormal innervation patterns imposed by the disease process. On this basis a sharp division may be made among its various applications 1 Where total or subtotal block is necessary

as in (a) surgical anesthesia and (b) shock therapy

2 Where partial block is desired as in (a) muscle spasm (b) spasticity and (c) rigidity We obviously are not concerned in this discussion with the total paralyzant effect but rather with the partial or lisave effect

The first problem encountered in attempting to set up a partial neuromuscular block with aqueous curare hes in its evanescent effect and narrow therapeutic margin The aqueous drug is characterized by rapidity of action and excretion. West 2 Burman, and others have described its use in syndromes exhibiting spasticity rigidity and involuntary movement. They noted demonstrable clinical reduction in abnormal activity effect, however was universally considered to be transient and of questionable therapcutic value In the treatment of neuromuscular syndromes of a chronic nature this has made the drug little more than a curiouty Because of the rapid absorption high blood levels are achieved for short periods of time, during which central and peripheral curare effects occur concomitantly Along with the desired relaxation classical signs of curarisation often appear. This seriously in terferes with therapy, especially in the ambula tory patient. Prolongation of the desired effect

Presented by invitation, at the 141st Annual Meeti g of the Medical Society of the State f New York Buffalo General Sessions, May 7 1947 The A. Walter Suiter Lectureship.

at designated levels is difficult or impossible to achieve

In an attempt to prolong the desired blood levels and action, and avoid the unpleasant sideeffects incident to uncontrolled concentration, various measures have been tried An oil-in-wax suspension has proved the most efficient 4 This preparation consists of a suspension of 3 per cent d-tubocurarine chloride in 48 per cent wax and The suspension is given intramuspeanut oil It yıelds a cularly, usually in the gluteal region fairly satisfactory slow-acting effect, lasting in some instances more than seventy-two hours and in all instances more than twenty-four dosages which afford good clinical response, unpleasant side-effects rarely occur The drug has been singularly free of toxic effects and has shown no tendency to disturb normal body economy or cause habituation or tolerance Statistically, spasm, spasticity, and rigidity are affected in order of decreasing efficiency Dosage requirements are complicated, and more strikingly related to disease entity and degree of motor activity than to body weight. The therapeutic response is directly related to the nature of the abnormality of neuromuscular innervation more nearly the disease state maintains a type of bombardment favorable to the occurrence of a Wedensky-type inhibition, the more exemplary the result Duration of effect seems also related to the same mechanism. In general, the more constant and rapid the motor activity, the more successful the therapeutic result, and the longer the duration of effect Statistically, these observations are borne out well There is, thus, a striking correlation between physiologic expectation and therapeutic response Prognosis within reasonable limits is possible in a given case

The data presented here are based on an analysis of more than 500 treated cases which fall into the following categories

#### A Muscle spasm

- Myositis, actual muscle trauma
- Reflex spasm in orthopedic disturbances, low back syndrome
- 3 Joint disease, arthritis

#### B Spasticity

- 1 Spinal cord injury
- 2 Degenerative diseases of the central nervous system, such as multiple sclerosis
- 3 Cerebral palsy
- C Rigidity, postencephalitic Parkinsonism
- D Dyskinesia
- E States resembling muscle spasm and spasticity as in poliomyelitis

All cases were studied clinically from the neurologic and physiotherapeutic points of view Analyses of function and motor efficiency were recorded at regular intervals. In addition, where feasible, electromyographic studies and motion pictures were done. Our final impressions are based on this material

#### A Muscle Spasm

The entity clinically designated as muscle spasm may be defined roughly as a state of transient muscle contraction not amenable to voluntary control, it is characterized by resistance to stretch and ordinarily is associated with pain. It is in large part a protective device, an attempt at splinting to avoid trauma and pain the picture is well recognized It may be a muscle response to irritation, inflammatory or trau-It may be reflex in origin and secondary to pathologic conditions, visceral, or somatic, of like segmental neural connection Wolff, and others have shown that this latter type of muscle spasm may be perpetuated after cessation of the initiating stimulus and, thus, present a major treatment problem

The various lesions which together make up the low-back syndrome are excellent examples of the importance of the problem of muscle spasm in treatment. The initiating trauma or etiologic agent is followed by muscle splinting as a protective measure. Pain enhances the splinting or spasm, which in turn is followed by more severe pain and further muscle spasm. The vicious cycle is self-perpetuating.

Dramatic relief may be afforded by any agent which tends to interrupt and break up the cycle of splinting and pain. There are many traditional measures, all of which have some rationale and serve their purpose, at times, admirably. These include heat, traction, ethyl chloride spray, novocaine, or saline injections, and heavy sedation. Unfortunately, none of these measures is specific or generally reliable in a series of cases.

Since curare is known to create a myoneural block, it is logical to try to apply its properties to the treatment of muscle spasm It has been consistently possible to break up muscle spasm and enhance recovery rate when the initiating pathologic condition is static or brought under control Where the pain and local muscle spasm are secondary to a continuing stimulus, 1 e, root compression, radicular pain persists after reduction of the spasm and the local or reflex spasm often recurs shortly This response may prove to be a useful diagnostic test Relief of muscle spasm ordinarily is followed by abrupt relief of local pain and its reference However, where root compression, such as in hermation of the nucleus pulposus, is the exciting and continuing stimulus, the relief of local muscle spasm does not influence the severe pain and actually may highlight its segmental nature by removing temporarily the purposeful splinting action of the muscle spasm

The cases studied run the gamut of low back disorders, including the usual orthopedic disturbances, so-called low-back strain, osteo-arthritis of the spine, acutal vertebral lesions, disk lesions, and also some instances showing reflex spasm secondary to remote disease.

It is apparent from the results that in many cases of low back syndrome an abrupt cessation of the major complaints often follows upon relief of muscle spasm The sequence of events after treatment is of interest The patient usually notes an abrupt relief of major pain within several hours after injection. Mobility is increased and the patient describes a feeling of pleasurable relaxation, even drowsiness. The severe pain is followed by muscle soreness and localized pain in the region of actual disease, if it is capable of local signature. The soreness is a logical sequel since protracted muscle contraction is associated with diminished vascular exchange and ischemia It is known that, depending upon the chronicity of the process the muscle involved may thus show reversible inflammatory changes, cloudy swelling etc. The characteristic tenderness which remains even after complete relief of pain "coms to have its basis in this transient pathologic state

The flexion deformities which develop about diseased joints are well known. They represent a protective splinting device and an attempt to prevent further joint injury These conditions are reversible if treated early but if allowed to perent they inevitably go on to contracture and static deformity Striking atrophy of the opposing extensors occurs as is so often seen in the quad nceps group in disease of the knee joint. This is due to the prolonged reciprocal inhibition of the extensors while the flexors are in constant contraction, and is followed by true atrophy of the flexion deformity by relaxation of the contracted muscles permits adequate range of motion and chronic shortening is not allowed to occur The final result when the diseased process is burned out need not be accompanied by empling, secondary neuromuscular deformities. It is here that the relaxant effect of curare, along with in telligent physiotherapy, may have a real and post tive role.

#### B Spasticity

Spastiaty is characterized by increased excit ability of the stretch reflex. Motion, passive or active is accompanied by reactive muscle contraction of abnormal intensity which interferes with efficient motor function. No adequate measure has yet been described which will alleviate the discussion of the condition with complete success. Surgical procedures,

such as neurectomy or muscle-cutting operations take a toll in reducing motor power. In such cases an attempt is made to saturate the patient with curare at levels which do not interfere with voluntary function but reduce the hyperactivity of the stretch reflex. With good reduction in stretch excitability the patient's voluntary power is unmasked and retraining made possible in order to rebuild muscle volume and useful habit patierns. Without such reduction, physiotherapy increts acts as a simulant to reflex activity. The place of intelligent rehabilitation once spasticity is reduced can not be overstressed.

Cerebral Palsy - In his monograph on disorders of the central nervous system in children, Crothers' states it is essential to develop every motor asset in sight. This conservation and development of assets is procured by two different but closely coordinated methods First and always, by training and second by procedures which avoid or correct contractures" Achievement of both these objectives is facilitated by the use of curare in oil Training capacity is enhanced markedly by the reduction of abnormal activity, with a consequent increase in motor The same reduction in spasticity or efficiency abnormal muscle tensions also allows a range of motion and activity which prevents further fixe tion deformity or contracture Unlike surgical procedures designed to this and it is unnecessary to destroy innervation or reduce the number of functioning motor elements contributing to the deformity Effective diminution in abnormal motor activity can be obtained without perceptable loss of motor nower

One has only to watch these children at school to realize the titanic effort which goes into every attempt at motor performance. In light of this the degree of their achievement under this form of therapy might seem slight to the casual observer Nevertheless by objective per formance standards the improvement in motor performance is strik The same tremendous drive which characterizes their usual effort now pushes their perform ance levels forward at rapid rates. The final result again depends upon the manner in which the physiotherapist takes advantage of the reduction in spasticity It should be pointed out that all cerebral palsy cases do not exhibit pure spastic-The therapeutic results with curare are in direct ratio to the part played by spasticity as opposed to involuntary movements and dyskinesia.

#### C. Rigidity

Evaluation of treatment in these cases is most difficult. It can be stated definitely that rigidity is an indication tremor is not. Rigidity associated with extreme discomfort immobility, and beginning contracture can be alleviated partially

Sleep is usually improved Pain associated with long-standing muscle tension can be influenced to a gratifying degree In rigidity there is, however, a wide disparity in response and in dosage tolerated Where amelioration of rigidity occurs, the physiotherapist can add a great deal to the patient's comfort and motor efficiency by taking advantage of the decrease in abnormal muscle tension

## D The Dyskinesias

In conditions characterized by abnormal involuntary movements, such as dystoma and athetosis, the results are disappointing. This is to be expected on the basis of the pathology and type of motor management in these conditions. At times it is possible to reduce the amplitude and force of the involuntary movements so that reeducation can be attempted and carried out. However, the results are not of the same order as in muscle spasm and spasticity.

# E States Resembling Muscle Spasm and Spasticity, as in Poliomyelitis

The treatment of acute and subacute anterior poliomyclitis consists largely in the alleviation of symptoms and the prevention of deformity and loss of motor function. The fact that there is no specific therapy perhaps throws undue emphasis on forms of symptomatic relief.

During the early phases of the disease or acute febrile illness, meningeal inflammatory reaction occurs, accompanied by root irritation followed by what appears to be a muscle spasm Meningismus is followed by protective splinting of the erector spinal and thigh muscles to avoid painful stretching of neural elements Certainly root irritation is capable of initiating hyperesthesia and reflex muscle spasm tion, there may be actual inflammatory reaction in the muscles per se characterized by pain and tenderness, muscle shortening, and resistance to A similar picture is seen in acute rheu-Spasticity can also be elicited matoid arthritis at times and seems to be present when the muscles are studied electromyographically definition and mechanism of these states resembling spasm and spasticity are not completely clear The similarity of the clinical picture to true muscle spasm and spasticity makes a trial of curare a rational procedure Although the results to date have been encouraging, the final answer will have to await much further careful and controlled studies

It is obvious that a suspension of curare of this kind is potentially dangerous. Certain strict precautions must always be maintained. In spite of these, the possibility of rapid curare intoxication should be kept in mind. In our series of 500 cases.

more than 5,000 consecutive injections have been given without alarming side-effects. After an initial trial period, during which the patient is hospitalized, if possible, the patients have been kept on maintenance levels as ambulatory outputients.

The side-effects we have seen are of great in-They may be divided into those representing a concentration of curare high enough to cause paresis and affect autonomic and central synapses, and those which are true side-effects The first group may be identified with the classic picture of curarization and needs no discussion The outstanding effect of the second group is a histaminic or histamine-like response tient notes pounding headache, along with heat and flushing of the limbs Dizziness and cold sweat are seen, as well as transient fall in blood These reactions occur in 10 per cent of pressure cases and are usually of mild order, and do not per-Antihistamine drugs, such as benadryl or pyrabenzamine, have proved of no value in preventing these side-effects

We have seen no tolerance develop and no increase in sensitivity to curare. Certain disease entities are strikingly sensitive to the drug. These include myasthenia gravis and, to a lesser degree, amyotrophic lateral sclerosis. Other states, particularly spastic paraplegia, can tolerate enormous doses without untoward curare effects.

#### Conclusion

On the basis of our experiences in a fairly large series of cases, we have concluded that a longacting suspension of curare represents a useful tool in the treatment of muscle spasm and spasticity The physiologic implications of its mode of action are of great clinical and experimental in-Knowledge of the basic mechanisms involved is likewise helpful in predicting therapeutio effects Throughout our studies the importance of well-planned rehabilitative physiotherapy has been high-lighted Curare alone merely reduces the abnormal neuromuscular patterns remains for the intelligent physician to take advantage of this reduction in order to rehabilitate the patient and prevent unnecessary crippling deformity

#### DIVERTICULOSIS AND DIVERTICULITIS OF THE COLON

Review of 99 Cases

LEONARD K STALKER M.D. M.S. F.A.C.S., and SAMUEL C WITTMER M.D. Rochester New York

(From the Department of Surgery Highland Hospital)

IVERTICULOSIS is commonly seen in persons past middle life, but diverticulitis or an inflammation of these diverticula, is a comparatively rare disease. It probably can be assumed that approximately 1 per cent of the entire population has a diverticulosis. The majority of diverticula develop later in life and are probably the result of a mucosal herniation at the point of entrance of blood vessels into the wall of the intestine. Smithwick has estimated that approximately 5 per cent of people over 40 years of age have diverticulosis.1 Of this group he estimates that approximately 10 per cent subsequently will develop diverticulities and, of these, between 20 and 30 per cent will require surgical treatment. Ochsner and Bargen reviewed a large series of cases and reported diverticulosis as frequently in women as in men? They stated that diverticulous was rarely seen before the age of 30 years and that the incidence of diverticulities increased slowly in each half decade until that period between 55 to 59 years which marked the peak of incidence for each sex

It is generally agreed that the treatment of uncomplicated diverticultis is usually a medical problem but when complications such as per foration, peritonitis peridiverticulitis fistula formation, or intestinal obstruction develop surgery may be necessary. In a series of 227 cases of diverticulitis reported by Rankin and Brown, 48 or 21 per cent, required surgical treatment. Operation was performed in 99 or 26 per cent, of 376 cases of diverticulitis reported by Brown and Marcley. Other series have shown a comparable incidence of cases requiring surgical treatment.

Another point that is gradually becoming established, as has been pointed out by one of us (Stalker') elsewhere, is that an association between diverticulitis and carcinoma is very rare so rare that one might even suspect that the presence of diverticulous protects a patient from the coming of canner. In a series of 227 cases of diverticulitis reported by Rankin and Brown co-existing carcinoma was found in only four in stances? These same writers reported coexisting diverticulitis in only 4 of 679 cases in which operation was performed for carcinoma of the colon. Fallon noted while studying cases of diverticulitis at the Mayo Clinic, that carcinoma

coexisted in only 0.5 per cent. These authors felt that in as much as the sigmoid is the most frequent site for carcinoma, as well as diverticulities of the color their occusional simultaneous occurrence would be expected. The relationship between the two is incidental rather than actual

#### Review of 99 Cases

We have recently reviewed 99 consecutive cases of diverticulosis with or without diverticulitis. The diagnosis was confirmed in all instances by either roentgenologic examination or operation. Of these cases, 43 were admitted to the hospital as surgical problems and 56 as medical problems. The diagnosis occurred almost equally in the two sexes, there being 53 women and 46 men. The average age of the patients was 62 years the youngest being 23 and the oldest 82. In all instances when diverticulitis was present the patient was more than 40 years of age.

In 47 of the 99 cases, diverticulous was found as an incidental finding at the time of roentgenologic examination of the colon. There were few if any symptoms which could be held referable to the diverticula, but a few cases gave a history of past disturbances suggestive of mild attacks of diverticulitis. The symptoms and findings were in agreement with the diagnosis of diverticulitis in 52 of the 99 cases

Thirty-seven of these cases were uncomplicated and were successfully treated medically The symptoms presented frequently were analogous to those of appendicitis with the exception that they were left-sided rather than right-sided Pain usually localized in the left lower quadrant of the abdomen, was the most common and pronounced symptom This was often cramping and intermittent in character and occasionally extended to involve the entire abdomen or radiated to the back Gaseous distention was noted frequently and the pain was commonly relieved by a bowel movement. Nausea and vomiting were not uncommon, and a change in bowel habits either constipation or diarrhea, occurred frequently Bloody and tarry stools were uncommon A slight fever and leukocy tosis were usually present Tenderness, sometimes with spasm over the sigmoid was the cardi nal finding. In some cases a mass could be palpated These symptoms were all intensified when a complication, such as perforation, was present

Fifteen cases were treated surgically, because one of the previously mentioned complications existed. In many instances, as has been the case in other reported series, the preoperative diagnosis was incorrect. Four were diagnosed as appendicutes, 3 as intestinal obstruction, 2 as ruptured diverticula of the colon, 2 as carcinoma of the colon, and 1 each as a ruptured ovarian cyst, a twisted ovarian cyst, a pelvic abscess, and an ectopic pregnancy.

The operative findings revealed perforation with or without abscess formation in all cases An inflammatory mass was invariably present The treatment instituted was for the most part In 6 cases, drainage alone was conservative performed In 2, a temporary colostomy, and in 4. two-stage Mikulicz procedures were carried In 2 cases a primary resection with anastomosis was performed, and in 1, an abdominopermeal resection Three patients died postoperatively, but the immediate results were satisfactory in all other instances. One death occurred following a resection with anastomosis, another followed simple drainage, and a third followed a pulmonary embolism

Two cases which tend to illustrate a few of the problems presented by the surgical group are reported

Case 1 —A man, aged 74 years, was seen twentyfour hours after he had developed cramp-like pains in the lower abdomen which were referred to the epigastrium. There was nausea and vomiting. He had been unable to defecate and the abdomen had become markedly distended His temperature was There were 11,000 leukocytes 101 F A tender. relatively fixed mass could be felt in the left lower quadrant of the abdomen A sigmoidoscopic examination to a distance of 24 cm revealed no abnormal findings Roentgenologic examination showed an obstructing lesion in the lower sigmoid An occasional diverticulum was associated with this defect, and it was felt that it was characteristic of diverticulitis

At operation a lesion more suggestive of carcinoma than of diverticulitis was found. A two-stage Mikuliez type of resection was performed and pathologic examination revealed multiple diverticula with diverticulitis. The mucosal lining of these diverticula showed no cancer, but a few millimeters away from the opening into the largest diverticulum was an ulcerating adenocarcinoma.

Case 2—A woman, aged 59 years, was admitted to the hospital because of nausea, vomiting, and constant left lower abdominal pain associated with intermittent chills and fever. An appendent omy for these symptoms had been performed elsewhere twelve weeks previously. Examination revealed an ill-appearing woman who had a firm, tender mass

filling the entire pelvis, and, in addition, a huge mass which filled the entire right abdomen Roent-genologic examination revealed a mass in the upper abdomen causing downward displacement of the colon and elevation of the right diaphragm.

Abdominal exploration was performed, and a huge, simple cyst involving the entire right lobe of the liver and filling the entire right abdomen was found. At least 4,000 cc of clear fluid was evacuated from this cyst and the cyst treated by marsupialization. There was a huge inflammatory mass involving the lower portion of the sigmoid which felt like a perforating carcinoma.

In view of the history, the possibility of diverticulities could not be excluded, and a loop of transverse colon was brought out as a colostomy. The patient made an uneventful convalescence. The cyst of the liver has completely disappeared. Subsequent roentgenologic examination has demonstrated the mass to be an area of diverticulities.

The patient is having so little trouble from her colostomy that she has preferred to keep it rather than to have a closure or a resection attempted

#### Comment

There is no question in our minds that many more cases of diverticulosis than have been recorded were observed during the period that this review represents In order to obtain these, it would be necessary to go to the v-ray records to find out how often diverticula are found as compared with diverticulities Many of us never make notes on the diagnostic master sheet of diverticulosis, and, hence, any quotation of statistics obtainable from a record department would be most misleading We believe that this point has often been overlooked and, as a result, many unfair statistics have been published interested only in the problem of diverticulities as it pertained to the sigmoid colon, and, for this reason, no cases involving other portions of the gastrointestinal tract have been included in this

It is not fair, without some explanation, to state that in many instances the preoperative diagnosis was incorrect. In all of these cases the possibility of a complication of diverticulitis had been considered, but in view of the serious illness, roentgenologic examination of the colon could not be carried out. In most of these cases it was usually the first attack and the onset had been of a relatively short duration. In a few there were other associated surgical conditions. The tendency seemed to be to decide to operate on the basis of the frequent diagnosis of "acute abdomen" or because of the presence of obstruction.

The complications of inflammation and obstruction are the major indications for the surgical treatment of diverticulities. A direct surgical approach to an inflammatory process, such as

diverticulits, carries a mortality rate much greater than 35 per cent in contrast to a mortal try rate of from 5 to 10 per cent in the treatment of a noninflammatory lesion. It is obvious that as much conservation as possible should be excessed in the surgical treatment of these conditions. We feel that when more than drainage is necessary, an artificial colonic stoma should be first established. Then, after a few months, depending on the patient s progress, the diagnosis a persistence of the deformity and other factors a resection may be indicated.

Many of these problems were illustrated by the 2 cases reported. In each of these cases it was impossible either preoperatively or at operation to differentiate between carcinoma and divertic ulitis. A primary colostomy would have been performed in the first case had it not been possible to exteriorize the mass without much difficulty The finding of both carcinoma and diverticulities was coincidental. In the second case we felt almost certain that we were dealing with a perforating carcinoma but the response and examinations following a transverse colostomy have confirmed a diagnosis of diverticulities. In another case the surgeon felt so certain that he was dealing with carcinoma that an abdominoperment resection was performed. We feel that if cancer is to be coped with intelligently one cannot be too critical of this mistake

Although these 99 cases have not been fol

lowed for a sufficient period of time to be specific certain general observations have been made. A few of the cases of diverticuloss have developed diverticulitis. Approximately one third of the cases of diverticulitis treated medically have continued to have some trouble. The same results were obtained in those cases treated surgically.

#### Summary

A review of 99 consecutively treated cases of diverticulous with or without diverticulius has been made. Forty-seven of these were diverticulous and 52 diverticulius. There were 37 cases of uncomplicated diverticulius which were treated medically. Complications existed in 15 cases and surgical treatment was required. The association of diverticulities and carennoma of the colon is coincidental. Two cases which demon strated the difficulty of clinical differentiation between these conditions were reported.

## CZECHOSLOVAKIA HONORS AMERICAN DOCTORS

Five New York doctors will receive the Order of the White Lion, highest honor of Czechoslovakia. They are among 14 American doctors who will receive the honor for work done last summer as members of the Unitarian Service Committee Medical Teachur, Mission and Czechur, Mission a

Teaching Mission.

The New York doctors are Dr Alexander Frunschwig, clinical professor of surgery at Cornell Medical School and attending surgeon at Monerial Hespital Dr Leo M Davidoff attending neurological surgeon at Monteflore Hospital and professor of neurosurgery at Columbla Unity raity, College of Physicians and Surgeons, Dr L Emmett Holt Jr chairman of the pediatrics department of New 1 ork University and director of pediatric service at Bellovue Hospital, Dr C M MacLeod, chairman of the bacteriology department of N Y U College of Medicine and chief of the preventive medicine section of the Office of Scientific Research and Dovelopment and Dr E. A Rovenstine, director of anesthesia at Bellovue Hospital, and professor of anesthesia at N Y U

## JOINT SERVICE URGED ON DOCTORS DENTISTS

One hundred members of the American Academy of Dental Medicine attended the first annual meeting of the group in June, in the George Washington Hotel.

The physical welfare of patients requires 'not overlapping but integration of dontal and medical health service stated Dr Walter Henry Wright, dean of the New York University College of Dentistry

Diseases requiring the services of both dentist and physician would be brought under control in less time, with less suffering, with less cost to the patient, if dentists and physicians would regard the patients a single instead of a multiple health problem.

It would be difficult to outline the respective sones of influence of the dentist and physician Dr Wright declared adding. It is not uncommon that physician have extracted teeth for alleviation of systemic disturbances or that dentists have administered systemic medication for the relief of dental diseases. It is an othical duty to give the patient the benefit of a modern integrated health service.

## ANTIHISTAMINE DRUGS IN ASTHMA AND HAY FEVER

DAVID LOUIS ENGELSHER, M D, New York City

LMOST yearly new drugs and methods are 1 prematurely offered to physicians and the laity via periodicals, radio, and drug store media, with exaggerated claims for the cure and relief of asthma and hay fever

In previous years, we have had potassium chloride, ascorbic acid, and aerosol penicillin upon which I reported unfavorably 1-3 in spite of the marked enthusiasm for them at the time Histamine, nasal ionization, and phenol cauterization must also be mentioned for their initial enthusiasm

This year the antihistamine drugs, benadryl and pyribenzamine, are foremost Striking scientific reports. 4-6 with their fervor fanned by the lasty press and radio commentators, have produced an unprecedented demand, in my opinion, unwarranted by the following facts Initially, I desire to offer a word of caution The drowsiness which occurs in a considerable percentage of cases is at times so marked as to interfere with the ability to continue one's work This effect on car drivers, machine workers, and others may prove a source of danger to themselves and others This caution should be emphasized

The proof of results is not in animal statistics, but on the patient There are certain criteria which must be used, to evaluate a remedy prop-In New York City, the peak of hay fever suffering usually is Labor Day and Labor Day This period is, clinically, the most concentrated time of ragweed symptoms sions drawn before that time are not accurate since, spontaneously, the symptoms vary extremely during the day Any type of favorable conclusion may be drawn, even from a placebo In addition, a large enough number of cases of a severe persistent type, over a period of two years. and preferably those known to the physician are the other factors necessary for a proper appraisal The reason I state two years of observation is because one year the hay fever season may be comparatively mild as, for example, the ragweed season in New York City in 1946 That season was not as severe, in a general way, although in some cases, suffering was intense

With the preceding factors as a background, I studied the effects of the antihistamine drugs (benadryl and pyribenzamine) on 193 cases of simple, multiple, and mixed forms of asthma and hay fever on patients I had known for a number of years Ages varied from 3 years to 79, sexes were about equally divided, and occupations included housewives, office workers, teachers, physicians, dentists, pharmacists, students, outdoor workers, mechanics, and retired persons

It must be remembered that the symptoms of hay fever are not necessarily alike in all patients In some, sneezing predominates, in others, nasal obstruction or rhinorrhea, eye, ear, or throat complaints are severe in many people study, if the antihistamine drug stopped the sneezing or rhinorrhea, and resulted in nasal clogging, often to prevent sleep, it was not recorded as an improvement The patient would rather have a wet than a dry clogged nose noted such a result as poor Another observer may classify the effect as satisfactory or good because it stopped the sneezing

The above 193 cases were given benadryl and pyribenzamine for a three-day trial One hundred and twenty-seven, roughly two thirds, were either unrelieved or aggravated, because of the drying effect, resulting in cough and asthma in some patients who never before had chest symp-Of the remaining one third, some were definitely improved (9 per cent) and others somewhat better None of the severe cases of asthma was convincingly relieved, most benefit occurred in urticarias

Comparing the antihistamine drugs to our standard pharmaceuticals used in various synergistic combinations, such as ephedrine, epinephaspirin, aminophylline, phenobarbital, codeine, iodides, and others, the new drugs fail by far, in effectiveness in allergy conditions of the respiratory tract I have already mentioned the marked side-effect of drowsiness, dizziness, headache, nausea, and vomiting were also observed

If a procedure could be formulated, voluntary or legal, by drug manufacturers, lay publications, and radio commentators to defer extolling "new cures" for asthma and hay fever (also other disea es), until such time as scientific medical reports definitely affirm their value, the medical profession and drug trades would be saved repeated embarrassment and loss of prestige, and the public a fortune and disappointment

At this time, it is my opinion, that although the antihistamine drugs may be of fair to striking value in a small percentage of hay fever and asthma cases, the vast majority are not convincingly benefited, in asthma, the percentage is of negligible import, and does not compare in value with our standard drugs and procedures

#### CONFERENCES ON THERAPY

DEPARTMENTS OF PHARMACOLOGY AND MEDICINE CORNELL UNIVERSITY MEDICAL COLLEGE AND THE NEW YORK HOSPITAL

THESF are stenographic reports of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and New York Hospital with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital students and visitors. A selected group of these conferences is published in an annual volume Cornell Conferences on Therapy by the Macmillan Company The next report will appear in the October 1 issue.

#### The Treatment of Alcoholism

Dr. HAROLD G WOLFF We will consider today the problem of alcoholusm. It is difficult to deter mine the extent of this malady It has been con rervatively estimated by Kolb, of the United States Public Health Service, that perhaps two and one-half million people in the United States are addicted to alcohol to a degree that in some way interferes with their effectiveness and the ful fillment of their potential It is thought by Kolb also, that approximately 200,000 of these are seriously sick—and the problem of helping them has not been solved Dr Rennie will open the discussion

Dr. Thomas A. C. Rennie From 10 to 25 per cent of admissions to state hospitals are for conditions associated with alcoholism. In addition alcohol runs very high as one of the major causes

of psychoses

There is a growing awareness, fortunately of the fact that alcoholism is a disease not a weak ness of character, and that the alcoholic represents a human being who is escaping from intolerable stresses or strains Hence there is a very large emphasis now on psychotherapy in the treatment of these individuals. Satisfactory treatment is not yet the rule however From a manuscript just released representing a year's study by the Committee on Public Health Relations of the New York Academy of Medicine come the fol lowing rather interesting facts which point to the dearth of facilities for the treatment of the alcoholic. The figures are based on 1 609 replies to a questionnaire which was sent to several thou sand practicing physicians in Now York. Chronic alcoholies are treated by about 75 per cent of the psychiatrists who replied, by about 50 per cent of the general practitioners and by 46 per cent of the internists. They all said they treated some alcoholics however only 04 per cent of those replying said they treated more than 10 per cent of their total practice for problems of alcohol or in other words made any sort of specialty of that problem in treatment. The percentage treating the acute alcoholic was about equal for the psychiatrist the internist, and the general

practitioner with a slightly heavier weighting for the internst

The methods used in treatment ran a strange gamut of performances The largest number of physicians stated that they used psychotherapy A number of them who were questioned as to what they meant by that had great difficulty in explaining what psychotherapy meant most common form of treatment was hospitalization (when it was possible to get a hospital bed) Other forms of treatment relied heavily upon nu tritional aspects massive doses of vitamins, sedatives in one form or another Some physicians. not psychiatrists, mentioned that they used group psychotherapy Others stated that they used electric shock therapy a few that they used conditioned reflex therapy, although few were able to describe what conditioned reflex therapy was Among the psychiatrists about 40 per cent referred patients to Alcoholics Anonymous and about 23 per cent referred patients to various social agencies in the community

It is difficult to get an alcoholic patient into a hospital in this area, and it is a problem through out the country as well According to the an swers to the questionnaire the largest number of patients go either to Bellevue or Kings County hospitals both of which have psychiatric divisions and accept alcoholic patients the next largest number go to the Doctors Hospital the next to the Towns' Hospital and from there down.

Since 1945 all the municipal hospitals in the City of New York have been accepting alcoholic patients and putting them on the medical services only a few have special wings for the treatment of alcoholica

The knickerbooker Hospital about two years ago set ande 15 beds for the treatment of alcoholics referred by and in contact with Alcoholics Anonymous In the last five years from 8 000 to 12 000 patients per year entered Bellevue and New York municipal hospitals for alcoholism, their average stay being less than seventy-two Often they come in at night and go out in the morning. It is apparent that hospital

facilities for the treatment of this great problem are inadequate

Since psychologic factors in alcoholism are now being stressed, the psychiatrist's definition and classification of the alcoholic should be of interest as well as of importance in the treatment of the alcoholic. What is a chronic alcoholic? He may be defined as an individual who is unable to do without alcohol, who is completely and daily dependent upon alcohol for his comfort, and who is apt to take his first drink early in the morning of each day. He is a person who cannot function harmoniously or contentedly without alcohol

We recognize two large groups of chronic alcoholics—the "spree" drinker and the "steady" drinker. The spree drinker presents a special kind of psychologic problem—He is a man who may not drink for months at a time, and then goes off on a spree or "bender". This may last one day to a week or two, during which he drinks extremely heavily, often locking himself in his room refusing to see people—He comes out of the "spree" a few days or a week or so later, and has no desire for alcohol again for perhaps weeks, or months, or even years

The steady drinkers, however, are persons who have to have alcohol every day, and these are usually divided, in an attempt at classification, into four major categories One is that of the individual who has intolerable problems in his life knows what they are, but he cannot meet them with comfort, and he finds solace in alcohol second is that of the so-called psychoneurotic individual whose difficulties, problems, and conflicts he largely within himself, often unknown to him, and who finds that alcohol relieves the intolerable conflict The third category is that of the person who uses alcohol as a symptom of a more fundamental underlying psychiatric disorder Thus, we see patients in depression turning to alcohol, manies turning to alcohol to cele-Schizophrenic patients and the feebleminded are also easy prey to alcohol The fourth category is that of individuals in whom the personality component is not immediately striking, who just regularly and persistently take alcohol because they like the taste and effect of it

The treatment of the psychologic factors which lead to acute and chronic alcoholism, of course, cannot be considered here in detail. There are, however, clinical problems arising out of these conditions which demand immediate treatment. Let us consider these clinical problems in the management of acute alcoholism. I shall not burden you with the details of the picture of acute alcoholism for you all have seen it. It is usually self-limiting, harmless, and apt to be slept off quite satisfactorily, however, coma can intervene in an acute alcoholic spree and may require intensive treatment.

Great reliance is now being placed upon two major aspects of treatment. These stem from the more recent advances in the knowledge of the metabolism of alcohol. It is oxidized in the body rather slowly, about 10 cc per hour, this is best accomplished in the presence of insulin and glucose which facilitate its oxidation in the liver Vitamin B fractions, particularly thiamin and nicotinic acid, are also of value in this respect

Almost all treatment for acute alcoholism, delirium tremens, and other acute alcoholic conditions include the combined use of glucose and in-Usually 1,000 to 2,000 cc of a 5 to 10 per cent solution of glucose is given intravenously, together with 20 or 25 units of insulin, given sub-To this there is usually added, also cutaneously by the parenteral route, 50 to 100 mg of thiamin chloride and 100 mg of nicotinic acid levue Hospital 100 mg of ascorbic acid, as well as 5 mg of riboflavin by mouth per day is given that institution they also add 100 mg of pyridome to the regimen, in the belief that it may reduce the vomiting which so commonly is part of the picture of acute alcoholism Alcoholics require a high caloric diet with large amounts of protein as well as of carbohydrate It seems evident, therefore, that adequate nutrition with vitamin supplementation constitutes the backbone of the treatment as well as of the prevention of theserious sequelae of alcoholism

There are, however, additional important aspects in the care of the comatose, alcoholic patient He should be kept warm, turned frequently to prevent pneumonia, and given stimulants, if If the respiration is depressed semously, carbon dioxide and oxygen mixture may be Large amounts of fluids with electrolytes are required because alcoholics usually lose a considerable amount of fluid and sodium chloride in vomitus and diarrhea Every patient, of course, deserves a meticulous physical examination so that fractures, brain injuries, diabetes, and uremia, are not overlooked The only real dangers. usually, are those of circulatory collapse or pneumonia

Dehrium tremens presents different problems for treatment. The delirious react with great fear and panic, have visual hallucinations which are terrifying, and which are usually confined to small animals and bugs. There is disorientation, the patient does not know where he is and cannot grasp the significance of the environment about him. There is a characteristic tremor which gives rise to the name of the disorder. Delirium tremens is, also, usually a self-limiting disease, running anywhere from one to five or six days, with almost invariable recovery.

For its management it is preferable that these patients be put in a hospital Good nursing care is important. The patients are frightened and

need constant reassurance They find it difficult to orient visibly and should be kept either in a room brightly lighted or in one completely dark. Because they are disoriented and confused, they frequently mustake windows for doors, and a serious accident or inadvertent suicide therefore, should always be guarded against

Hydrotherapy is used commonly in the acute case of delirium tremens. The rest of the treatment is largely supportive. Treatment includes the use of vitamins, sedatives, and the insulin and glucose combination, already mentioned. The most commonly used sedative is paraldohyde. It to 20 cc by mouth or in smaller doses intra muscularly if the patient is unable to take it orally. Chloral hydrate is also used in 0.5- to 1 Gra, doses, and more rarely the barbiturates particularly sodium amytal in 0.25- or 0.3-Gm doses. Some physicians do not use barbiturates in alcoholics because they fear the development of dependence.

These patients also need large amounts of fluid and sodium chloride Routine care also includes a high calone diet preferably fluid (often delirious patients are not able to tolerate solids because of persistent gastratis), and large amounts of car bobydrate and protein. In about five days the patient usually recovers without sequelae One danger in delirium tremens is that of circulatory collapse. Subslightalization is sometimes carried out if there are signs of cardiac distress so that the patient can be digitalized more rapidly if it should become necessary

There are a group of disturbances which result from, or are associated with the long-continued use of alcohol which I have time only to enumer ate but of which we must be aware acute alcoholic excitement, pathologic alcoholism with epileptoid manifestations acute or chronic hal lucinosis alcoholic deterioration jealousy and paranoid reactions Korsakoff's psychosis and the Wernicke syndrome. Many of these are pri marily vitamin deficiency disorders only secondarily due to the use of alcohol These complica tions develop because of poor appetite deficient food intake and the vitamin inadequacy that almost invariably accompanies it Their treatment involves restoration of vitamins by massive doses, either orally or hypodermically over a long period of time Some of these disorders do not clear up rapidly even though the vitamin defi ciency is treated

Finally, we come to the problem of the chronic alcoholic the psychologic types of which I have already defined. The chronic alcoholics are best treated in a hospital although very few of them are willing to accept that formulation. Hospital intion removes the alcoholic from all sources of alcohol. In the hospital he is separated from an

environment which is stressful. It is a neutral environment in which the nursing staff as well as the physicians are understanding of his problems. The psychiatrist has the opportunity to observe his day by-day reactions and his responses to other patients, to analyze his anxiety reactions as they occur, and to proceed much more rapidly with the psychotherapeutic exploration. For these reasons, hospitalization is desirable—hospitalization for a fairly protracted period a minimum of three and preferably, six months or longer

In New York State it is not possible to commit alcoholies. Revision of the laws of the State to make this possible should be given careful consideration because one of the great difficulties with the complete treatment of chronic alcoholics is that usually four to six weeks after alcoholics have stopped drinking they attain a state of mild ouphorm, and think they have solved their problems and no longer need to go on with therapy If they demand it, they must be released from the hospital Alcoholics can petition for a voluntary In such a case hospitalization can commitment be ordered by a judge and the patient kept in a hospital until cured although at some earlier time he may desire to leave

The first problem of course, is to get the alcoholic to stop drinking At Payne-Whitney we withdraw alcohol immediately. We feel that there is no valid psychologic reason for a tapering off procedure Removal of alcohol requires strong reassurance suggestive measures attention to dietary needs and sedation if discomfort is great Prequently hydrotherapy is the best form of nonchemical sedation The second major problem is through self-analysis to get the man to understand the primary causes of the emotional distress that lies within his own personality He eventually may attain complete insight into the forces which so commonly are subconscious and which he does not usually or easily recognize

Several other procedures are of sufficient value to merit mention. There has been a growing in terest in the past few years in a process called conditioned reflex or conditioned-aversion therapy which was developed on the West Coast and is used in several hospitals today It consists of the injection of 0.25 to 1 cc of a mixture which contains, in each ce 75 mg of emetine and half as much pilocarpine and ephedrine Ав уон сал imagine it produces violent nausen. The injection is given to the patient together with alco-Treatments are given once a day for three to seven days Reinforcement single treatments are given at the end of one month and two months and following that at three-month intervals for a year The Washingtonian Hospital in Boston which is one of the few hospitals

in this country devoted exclusively to alcoholism, claims excellent results from that procedure, having as high as 70 to 80 per cent of cures as measured by abstinence for periods of two or three years

One of the large private hospitals in this area stated that 25 per cent of their cures of alcoholics was accomplished through Alcoholics Anony-Indeed, so important is that organization that every physician should be aware of what it does, and how they can get help from it holics Anonymous is an organization of nondrinkers, all formerly alcoholics, banded together some twenty years ago, now numbering 25,000 members in 750 cities throughout the entire world They are dedicated to the cure of alcoholics the request of any alcoholic patient they go to his home, get him to a hospital, and stay with him through his hospitalization. When he gets out they find a job for him What is still more important, they provide for him what is so difficult to provide for the alcoholic, a social environment in which alcohol does not figure as a major tool of release and relaxation Alcoholics Anonymous is an extremely important development in the treatment of alcoholics which should be drawn upon much more

Few general practitioners are aware of the extent to which social service workers' organizations can be helpful in the total problem. They can help in providing hospitalization, they can provide jobs, they can provide support and reassurance throughout very difficult periods. They are far too little drawn upon by the general practitioner.

I have told you of the dearth of facilities in this area and the dearth that exists throughout the country Obviously, what is needed are more provisions for the medical treatment of this vast group of disabled people. There is a growing conviction that their treatment lies primarily with the general practitioner, the internist, and not so much with the psychiatrist, and that ideally facilities for the treatment of these individuals should be set up in general hospitals, not in psychiatric hospitals. Another important development is the establishment of outpatient services such as have been evolved at the Yale Medical School (The Yale Clinic Plan)

Finally, we must recognize it as a truly great public health problem, the importance, the magnitude, and the requirements of which must also be brought to the attention of the public. In our social planning for alcoholics, we lag far behind that which is already under way in Sweden and Switzerland. There they have local temperance units in all the small cantons and small communities. Immediate emergency help is available

and the patients are referred to appropriate sources for additional help. This type of social planning has shown little evidence of emerging in the United States

For those who want more specific help with the management or understanding of these problems there are now three national agencies concerned with the treatment of alcoholism. One is the Research Council in Problems of Alcohol, a national organization in New York devoted to the aspects of research into the causes and prevention of alcoholism. Another is the National Committee for Education on Alcoholism, also in New York, and the third, the National Committee of Alcohol Hygiene, is located in Baltimore

DR WOLFF Dr Rennie, in referring to the management of the acute alcoholic you spoke about the use of stimulants What did you mean specifically?

DR RENNIE The one most commonly used is caffeine sodium benzoate, 0 5 to 1 Gm Another fairly common one is benzedrine sulfate, 5 and 10 mg

DR CARY EGGLESTON Circulatory rather than cardiac stimulants?

DR RENNIE Yes

DR WOLFF Is anyone convinced that giving vitamins to a person in the acutely alcoholic state could be effective in the short time that the individual remains in that state? I take it that it would be a matter of twelve or fourteen hours at the most

DR HARRY GOLD There does not seem to be very much doubt that the actions of the vitamins may appear fairly quickly A bird that is unable to fly because of vitamin B<sub>1</sub> deficiency may be able to fly off within a few hours after a massive dose of vitamin B<sub>1</sub> A person with scurvy may after a massive dose of vitamin C, show unequivocal improvement within twenty-four hours This, also, applies to the case of defective dark adaptation, after a massive dose of vitamin A

If these patients are really suffering from a vitamin deficiency and receive adequate doses, considerable improvement might take place in the course of a few hours after administration

DR McKeen Cattell Dr Wolff, I think there is a certain amount of logic in the use of insulin and glucose, but I would like to point out that one could not expect too much from them I do not remember the exact figures now but approximately half of the total metabolism may result from the burning of alcohol It is apparent that that percentage cannot be increased very much without burning up the individual I think the actual increase in the elimination of alcohol by that procedure cannot be very important

DR WOLFF It could, perhaps have some other role than in total elimination. Could it have a specific effect in tissue?

Dr. CATTELL That might well be, as a matter of fact, it is known that life may be protected by such treatment The procedure possibly may be worth while in the treatment, and there is some evidence that the addition of glucose may im prove central nervous function, but I was thinking of the usual explanation that is given As far as promoting elimination is concerned. I believe that that cannot be accomplished to any important degree

DR WOLFF I would like to ask about subdigitalization in patients with delinum tremens Dr Gold, would you suppose, if a person were in danger of circulatory collapse as the result of this disorder, that it would make much difference whether he were getting subdigitalization doses. or full doses, or none at all?

DR. GOLD Unless there is fairly clear evidence of heart failure, I believe that digitalis would have no influence at all

Dr. Rennie The only death I have ever seen in a delinum tremens was due to cardiac failure DR Gold And not peripheral circulatory collapse?

DR RENNIE No, heart failure

Dr. Gold Of course, since there are about 13 000,000 cardiac patients in the United States and 2 500 000 people with alcoholic troubles, it would not be strange if coincidence produced a patient with both conditions from time to time I should think in the absence of heart disease, the problems of the heart in delirium tremens would not be those requiring digitalis

Dr. Wolff Would you suppose that alcohol would harm a heart that was not in failure or be-

ginning to fail?

Dr. Gold I doubt very much that it would in the range of concentrations in humans

Dr. Wolff If it did, would you suppose digr talis would make any difference?

DR GOLD I would doubt it.

Dr. Wolff Dr Rennie we see from time to time individuals who have been addicted to one form of a sedative or who take sedatives for con vulsions, who have fits precipitated by the sudden withdrawal of such a medicament. Apparently there is danger of fits in the alcoholic who sud dealy has his alcohol withheld (Dunning Inter national Clinic III vol 3, 1940) When you say that alcohol should be completely and suddenly withdrawn in chronic alcoholics, do you consider such a possibility? Is hydrotherapy and I assume you mean submersion in a tub for hours sufficient, or might the alcoholic in addition receive a bromide a barbiturate or some agent other than alcohol, or would you withdraw all medicaments during this precarious period?

DR RENYIE I would not withdraw all medica Routinely in a delirum tremens patient. when I remove alcohol I replace it with a sedative, preferably paraldehyde. Most alcoholics prefer it and it also seems to be about the most effective No I would not remove alcohol and leave that person with no support at all He is much too tremulous, anxious and frightened clearly needs sedation as well as prolonged baths This holds for the management of the chronic, the acute alcoholic, as well as the patient with delir

May I say something about the convulsive manifestation?

DR WOLLE Please do

lum tremens

Dr. Rennie There is a very rare condition associated with alcohol but more with the ingestion of it and not with the cessation of it and that is the condition which I designated as pathologic There are cerwith epileptoid manifestations tain individuals, probably epileptoid, who may not have convulsive scirures without alcohol but who show them after the long-continued use of I have never observed the production of a convulsion as the result of the withdrawal of alcohol as we do see convulsions following the immediate withdrawal of barbiturate medication \*

DR WOLFF You referred in your discussion of the management of delirium tremens to the use of sodium chloride and large amounts of fluid Is there not the impression—and perhaps I am wrong—that some of these people have "wet" brains?

DR RENNIE Dr Wolff is needling me because I wrote a manuscript recently in which I recom mended hypertonic glucose for the edema of the brain Dr Wolff, you could answer that question better than I can

DR Wolff Although postmortem edema in patients with delirium tremens has been considered to be present by Nazum and Le Count (J.A)M.A 67 1822 (1916)) I am personally not convinced that it makes much difference whether one gives more or less than the usual amount of fluid or salt Perhaps some of these people are pretty ' dry 'after hours without fluid or food and therefore are entitled to fluid for reasons of their dehy dration

Dr. Rennie Most of them are usually badly dehydrated

DR. Gold What i the fact in relation to hypertonic glucose solution? Does it seem to make them better or is it one of those practices continued by the momentum of tradition?

<sup>\*</sup> Since these comments, I have seen one lcoholic patient wh soffered a convolution during withdrawal. He had a normal electrocardi gram.

DR RENNIE Dr Bender, whom I have heard discuss alcoholism, has always used the so-called alcoholic wet brain, the edema of the dura and pia-arachnoid, as the paradigm of what alcohol does to the rest of the human body If one assumes that in delirium tremens there is intracranial edema, there is a rationale in attempting to reduce it by the use of a hypertonic solution You have also heard that Dr Wolff does not agree with that

DR WOLFF It does not matter whether I agree with it or not I don't believe it has been demonstrated I would also like to know whether there has been any evidence to the contrary

DR GOLD How do we now stand with regard to the precipitation of delirium tremens by the withdrawal of alcohol?

DR RENNIE It is my impression that more patients with delirium tremens are precipitated into it by the abrupt cessation of taking alcohol than those who develop it during the course of the continuous use of alcohol. One sees it occasionally on a surgical service after a patient who has not been recognized as an alcoholic has had an operation. Following the operation, with abrupt withdrawal of alcohol, one may get a delirious patient.

Nevertheless, we withdraw alcohol abruptly These are our reasons—If the patient already has delirium tremens there is no problem of inducing delirium. If the patient is a chronic alcoholic, but has not developed delirium tremens, we take the chance that he can, with adequate medication, avoid delirium. As I remember, some ten years ago in a large series, I think at Bellevie, or perhaps at one of the state hospitals, in several thousand cases alcohol was abruptly withdrawn, and, in another large group, the patients were tapered off. There seemed to be no significant difference in the incidence of delirious reactions in the two groups.

DR GOLD Wortis wrote a paper a few years ago on his experiences in Bellevue in that connection. He said there was nothing to the idea of precipitating delirium tremens by the abrupt withdrawal of alcohol. He used as evidence the experience there, in which it was found that very few cases of delirium tremens developed on the wards when the withdrawal was abrupt

DR WOLFF It is only fair to say that a certain number of people stop drinking as the first manifestation of their delirium tremens. This may confuse and cause some to believe that the withdrawal of the alcohol has caused the gastritis, restlessness, and anxiety. Would you care to comment on this point?

DR RENNIE I think that that is probably so There is a difference between abrupt self-withdrawal with no further support and abrupt withdrawal in the hospital with the support of sedation, hydrotherapy, and psychotherapy. The latter makes an appreciable difference in whether or not delirium develops

DR WALTER MODELL Dr Rennie, you expressed a fear that in alcoholics there was a danger of dependence on sedatives, on the barbiturates, and especially in the case of chloral hydrate

DR RENNIE I did not mean it was greater than in other addicts It is the tendency of alcoholics to lean on props

VISITOR I would like to ask Dr Rennie if he had any explanation of why the hallucinations of delirium tremens are so terrifying while hallucinations induced by other drugs may actually be amusing or pleasant

DR RENNIE They are not invariably terrifing in delirium tremens. I have seen patients in
delirium tremens who were vistly amused by the
parade of bugs across the wall. It need not be,
although most commonly there is a fear reaction
Why that is, I don't know. Do you, Dr Wolff?

DR Wolff I have examined 106 people with delirium from 27 different etiologic agents, and I could not see that the precipitating cause made much difference in the content of the delirium. It happens that delirium is commonly induced by or associated with the use of alcohol (in 30 of the 106 patients I studied). It also happens that many people are frightened when things become unreal.

They get shaky when they have visual hallucinations But there are some who can look with detachment upon such things, just as they can look at other deviant circumstances in their lives I think that the reaction depends on the temperament and experience of the patient, and is a highly individualized matter

DR GOLD I wonder if Dr Rennie would say something about that strange mixture which is used to produce vomiting. Why a mixture of pilocarpine and emetine? Why ephedrine should also be used I cannot understand. It seems to me there ought to be much simpler ways of producing sustained nausea. A few teaspoonfuls of syrup of ipecac will make people remain in a state of nausea for hours on end. Is there anything more to that mixture? Had the originators any thoughts in mind other than to produce nausea?

DR RENNIE I don't know

STUDENT I should like to know what Dr Rennie thinks of conditioned-reflex therapy?

DR RENNIE There is nothing very new about conditioned-reflex therapy In 1890 there was the Keely cure, which is comparable. The only new item is the use of the scientific term, conditioned-reflex. One might think of this procedure, producing a conditioned type of response, conditioned vomiting, because it occurred, previously, so regularly in association with the taste of alcohol. I have not used the method.

VISITOR Is the victim aware of what he is getting with each drink or is it just slipped in very quietly?

Dr. Rennie A friend of mine told me of a third person whom he met on his way to his doctor's office with a pint of gin in his pocket. "See this," he said, "I am going to get one ounce of it, and then I have to turn the bottle over to the doctor "

He had to bring his own alcohol for his treat He knew perfectly well what he was get The rationale of the treatment is made perfectly clear to these patients, and they are cooperative with the procedure

DR. CATTELL This treatment actually sets up conditioning so that they respond later to the alcohol alone, with vomiting?

DR RENVIE Right

Dr. Wolfr Would that work if a man did not wish to be helped?

Dr. Rennie I don't know of any therapy for alcoholies which will work against the wishes of the person to be helped

STUDENT Is it not likely that the alcoholic who uses alcohol for purposes of release will turn to something else if he is deprived of alcohol?

Dr. Revnie I am very glad you brought that up For that reason treatment must always be combined with active psychotherapeutic measures VISITOR Would you say something about the

incidence of suicide during the withdrawal in debrium tremens? DR RENNIE I have not heard that it was in

any souse a common occurrence Same Visitor Don't alcoholics, during with drawal, use the threat of suicide as sort of a drive

to get more whisky?

Dr. Rennie That has not been my experi

VISITOR Dr Rennie is it your impression that when things are worked out more ideally at some luture date that in the over all management of the patient some attention would be paid to the family of the alcoholic, not only to the wife of the married man but also to his parents?

Dr. Rennie I think that is extremely important A great deal of attention must be devoted to the family or the desperate human beings. They make anxious and They are anxious and the more the more they are worned They are apt to have the more common prevailing social attitude that this is a weakness a defect of character They are frequently either extremely overindulgent with the alcoholic or overly punitive. They are rarely able to accept this as a genuine illness, deserving of medical care. They need a great deal in the way of education and understanding not only as to what the problem is, but also what the steps in

the treatment should be Obviously, where they play a leading role in the psychogenesis of an alcoholic's problems, they must be drawn into the treatment Sometimes indeed they need help themselves, but there is a very large area in the whole psychotherapeutic problem in which the family plays a leading role and into which they must be drawn if treatment is to be effective. Dr. Wolff Dr Rennie, I know it is hopeless to try to make a prognostic statement. Cures seem to vary anywhere from 1 to 3 in 10 to 7 or 8 in 10 Does that depend on the type of patient selected or the type of therapy? What would you say the variables are?

DR. RENNIL The highest figure I know is about 85 per cent cures. That was in a group of patients who were not in a hospital but on a farm where they worked all day, contributed to the life of the group, and where they had only fellow alcoholic patients as companions.

Obviously, the percentage of cures depends on a number of factors What is the fundamental cause of the disorder? Is it a relatively reactive condition amenable to direct attack, or is it so deeply ingrained in the personality makeup of the individual that it requires a long devious intensive psychotherapeutic exploration? Does it occur as a symptom in a well-integrated, well organized successful individual with many assets to draw upon or does it occur in a so-called psychopathic personality unstable and undependable and lacking in rational goals? Personality makeup makes a tremendous difference The duration of disability makes a difference, as does the age of onset or age in which the condition reaches its All of these factors may affect prognosis. peak

The skill integrity and sincerity of the therapist make a still greater difference in prognosis The man who claimed the 85 per cent cures which I just mentioned is one who very early in his career of treating of alcoholics felt that he had to give up drinking himself that he could not hope to be sincere and to sell a patient the idea that a nondrinking life could be useful and constructive if he were having cocktails at dinner convinced that unless one is a nondrinker one can not be a good therapist of the alcoholic.

The Alcoholics Anonymous group rely very heavily upon an inspirational quality of therapy which is wo ren into a relimous consideration of the power of God in giving strength to these people. Something of the same kind of fervor marks the personality of a good therapist of an alcoholic.

Dr. Wolff The hour is up and we shall have to end our discussion.

#### Summary

Dr. Modera Alcoholism is still a vast un

solved therapeutic problem approximately 200,-000 persons in this country are disabled by it and more than ten times as many are affected to a It was brought out that most lesser degree physicians who treat alcoholics are not serious students of the problem, that there are few hospitals prepared to take care of alcoholics, and that there are only a few groups in this country who, like Alcoholics Anonymous, attempt to provide help for the treatment of all aspects of the broad problem

The cure of the chronic alcoholic requires the integration of the psychologic, medical, and social aspects of the patient's problems therapy is of outstanding importance proper psychiatric classification of the patients, whether he is a "steady" or a "spree" drinker, and the reasons for the drinking will determine psychotherapy

The alcoholic is best treated when removed to a hospital or other environment less stressful Alcohol is generally withdrawn than his own abruptly and without any "tapering off" Psychotherapy, sedation, assurance, and good nursing are substituted A novel approach to alcoholism called the conditioned-reflex or conditioned-aversion treatment, which has proved highly successful in some institutions, was discussed form of therapy the patient is given, together with an alcoholic drink, an injection of an emetic mix-This conditions the patient so that eventure tually he vomits from alcohol alone Regardless of the method used, however, unless the difficulties which drove the patient to become an alcoholic are corrected, and the patient is cooperative, the "cure" will be temporary, and the patient will return to alcohol or turn to some other form of escape

The medical treatment discussed concerned acute alcoholism and delirium tremens alcoholism about 25 units of insulin is given together with an infusion of one or two liters of 5 or 10 per cent glucose solution Although the purpose is to accelerate the rate of oxidation of alcohol in the liver, it was pointed out that, on a physiologic basis, this had only limited possibility in that direction, but that, on the other hand, the therapy might serve other useful purposes Special attention is paid to diet, and especially to vitamin supplementation Massive doses of many vitamins are often given Some feel that vitamin B fractions are of assistance in facilitating the metobolism of alcohol However, since these patients, usually, are poorly nourished and frequently suffer from clinical or subclinical vitamin deficiencies, this may serve as the basis for the rational use of vitamins The parenteral administration of saline is indicated in cases in which there has been considerable fluid loss, as after prolonged vomiting or diarrhea Intercurrent infections are watched for Pneumonia and circulatory collapse are the most common, serious com-A careful physical examination is necessary since, although alcohol may be detected on the patient's breath, his coma may be due to other causes such as fracture of the skull, diabetes, or uremia

Delirium tremens presents other problems is usually a self-limiting manifestation of alcoholism, lasting about five or six days ization and reassurance are indicated of the disorientation, serious accidents must be guarded against The treatment for acute alcoholism is followed Sedatives, most frequently paraldehyde, 10 to 20 cc by mouth, or smaller doses by muscle, may be necessary therapy is a most useful, nonchemical, sedative

The precipitation of delirium by the abrupt withdrawal of alcohol was discussed It was brought out that although this might precipitate delirium in occasional cases, it was not a serious contingency in the well-organized alcoholic ward, in which the patient is not left without support and sedation, and where psychotherapy is applied simultaneously with the withdrawal of the alcohol

## DR REULING WILL HEAD TUBERCULOSIS ASSOCIATION

Dr James R Reuling, director of medicine of Flushing Hospital and Queens General Hospital, New York City, was named president of the National Tuberculosis Association at the Association's annual meeting in June He succeeds Dr William Shepard, of San Francisco

A member of the N T.A. board of directors since 1940, Dr Reuling is treasurer of the Medical So-

ciety of the State of New York, a member of the American Medical Association and the American Trudeau Society, and a fellow of the American College of Physicians He formerly was president and chairman of the board of trustees of the Queens County Medical Society and president of the Queensboro Tuberculosis and Health Association

#### NECROLOGY

Albert F Barry, M.D., 79, of Amityville, died on December 12 1046 A graduate of New York University College of Medicine, in 1888 Dr Barry was resident physician at Brunswick House in

Amityville

Michael Block, M.D., 73 of New York City died in June. Dr Block was a graduate of the Medical College of Virginia in 1900 He was assistant physician at the Good Samaritan Hospital and a member of the American Medical Association and the New York State and County medical societies

Norbert Odeon Bourque, M.D 69 of Now York City died on November 23 1940 He was a member of the American Medical Association and New York State and County medical societies. A graduate of the University of Tennessee Medical College in 1906 Dr Bourque also was graduated from the University of Lausanne in Switzerland in 1923 and the University of Paris in 1925 He was a member of the staff of the Mother Cabrini Memorial Hos-

pital in Chicago, Illinois
Dayre B De Waitoff, M.D., of Brooklyn, died on
June 19 Ho was 87 years old Born in Russia Dr
De Waltoff, was graduated from St. Vladimir's Medical College in 1887 and later from the Long

Island College of Medicine.

William Donovan, M.D., 78, of New York City died on January 30 He was a graduate of Bellevue Medical College in 1898 and an alumnus of City Hospital. He was a member of the American Medical Association and the New York State and

County medical societies

Martin Downey M.D. 80, of New York City, diod on November 4 1948 He was a graduate of Bellevue Hospital Medical College in 1893 He was a member of the New York Academy of Medicine the American Medical Association, and the New York State and County medical societies

L. B Gardner, M.D., 73, of Geneva, died on September I, 1946 He was graduated from Eclectic Medical College, in Cincinnati in 1899 A member of the American Medical Association, the New York State and Ontario County medical societies he was on the staff of the Geneva General Hospital

John Russel Foshay, M.D., of Peckakill, died on June 14, at the age of 67 He was graduated from the College of Physicians and Surgeons, Columbia University in 1909 and interned at French Hospital, New York. Until his retirement in 1946 Dr. Foshsy practiced medicine and surgery in Peckskill for thirty five years He had been president and sceretary of the medical board of Peckskill Hospital and was a member of the hospital a board of directors. He was a member of the American Medical Association, and the New York State and Westchester County medical societies

Ralph William Hall, M.D., 63 of Brooklyn formerly of East Chatham died on September 7, 1948 He was graduated from the Long Island

College of Medicine in 1911

Edward L. Hanes, M.D., of Altadena, California, and formerly of Rochester died June 14 at the age of 76 A neuropsychiatrist Dr. Hanes was graduated from Albany Medical College in 1899 and served the latest the control of the contro his internship at the Lying In Hospital in New York In 1909 he began private practice in Roches ter, serving also as neurologist at General, St. Mary s, and Genesee hospitals in Rochester He had charge of the neuropsychiatric division of

Base Hospital 19 overseas in the first World War and later was a consultant to the Veterans Administration He was also on the staffs of Craig Colony at Sonyea, the Hudson River State Hospital in Poughkeepsie, and the Rochester State Hospital

## House of Delegates Minutes of the Annual Meeting May 5 to May 7, 1947

THE 141st Annual Meeting of the House of Delegates of the Medical Society of the State of New York was held at the Memorial Auditorium, Buffalo New York, on Monday, May 8 1947, at 10 10 A.M. Dr Albert F R. Andresen Speaker, Dr Walter P. Anderton Secretary Dr W Guernsoy Frey, Jr Assistant Secretary
SPEAKER ANDRESS The House will please come

to order

I will ask the Secretary for a report from the

Reference Committee on Credentials.

Schetary Anderton Mr Speaker there are no disputed delegations I am informed by the Chair man of the Reference Committee on Credentials and all on our rolls are entitled to vote.

SPEAKER ANDRESEN The Speaker declares the 141st Session of the House of Delegates open for the

transaction of business.

#### Section 1

#### Report of Reference Committee on Credentials

SPEAKER ANDRESEN We will now hear from the Chairman of the Credentials Committee McCarty

SECRETARY ANDERTON He is out at the desk, but

a quorum is present, sır The Secretary reports that SPEAKER ANDRESEN a quorum is present. Sixty members constitute a quorum, so that we are ready for business.

#### Section 2

#### Opening Remarks of the Speaker

SPEAKER ANDRESEN It is with a feeling of sadness that I appear before you this morning as your Speaker When you elected me your Vice-Speaker last year I expected to sit here at the side of the Speaker my friend, Dr Sullivan, and learn from him the job of conducting this meeting, in the expecta-tion that perhaps some day I might become the Speaker but this happy genial friend of every mem-ber of this House, this indefatigable worker for the best interests of our profession this fine surgeon who should have had before him many years of service to humanity has been taken from our midst. We mourn his passing we are grateful that he was amongst us. I ask you to rise and spend a minute in selent meditation in memory of our friend, Frank Leslie Sullivan and in consideration of the responsibility be passed on to us to further the interests of

the medical profession of the State of New York.

The members arose and stood with bowed heads in silent memory of their departed colleague,

Dr Frank Lealle Sullivan

SPEAKER ANDRESEN I hope that the members of this House will have patience with me as a neo-phyte in this job of Speaker especially as my prede-cessor Dr. Louis H. Bauer generally recognized as perhaps the most brilliant presiding officer in the medical profession who hold this office for six years, set a precedent which would be difficult for anyone to follow I have not been a delegate long enough to know you all by name, and this fact, combined with my notorious lack of memory for names, will make it necessary for me to ask each member dear ing to speak to mention his name and the county he

represents. This will avoid embarrassment to the member and to me. To expedite business I also request that anyone wishing to make a motion or to address the House should come up to the rostrum and speak distinctly into the microphone and to speak briefly and to the point. It is a rule of this House that except under extraordinary circumstances and then only by the consent of a majority vote of the House no one may be allowed to speak for longer than five minutes nor more than once on any subject. It is the violation of this rule which so often delays proceedings and prevents our hear ing the opinions of others who do not enter into a discussion in order not to take up unnecessary time.

I expect to enforce this rule

As a delegate to this House and to the House of Delegates of the American Medical Association I have often been impressed with their resemblance to our legislative bodies, in Albany and in Washington While we here represent only the medical profession and the legislative bodies represent the entire population, our methods of procedure are similar tions made on the floor and reports of officers and standing committees are referred to reference committees whose recommendations are acted upon by the House as a whole The same rules of order are applied, and the business of both houses is often delayed by garrulous speakers, yet how different is the spirit displayed by the members. In Congress unfortunately for the good of our Country as a whole, too many congressmen think more about their re-election than about their responsibility to the Nation, spend more time seeking to get appropria-tions and favors for their local constituency or for pressure groups than to enact legislation of benefit to the Country and to the world at large I have been pleased to observe that in our medical assemblies no such localism no such deare for self-aggrandise-ment, no such abject surrender to special interests has been noticeable. When our delegates make motions their purpose practically always is altruistic and while of necessity the business of the House will concern matters of importance to the preservation and betterment of medical practice and of the status of the individual practitioner in the end all improvements in medical practice must accrue to the benefit of the public whose health and happiness are so largely dependent upon the type of medical care provided for it.

Members of the House, I am proud to be your presiding officer—I shall do my best to act as your umpire at this meeting and unlike the umpires at Ebbet's Field in my county I am protected by the fact that the management of this House has for bidden the sale of soda pop among the spectators.

#### Section 3

#### Approval of the Minutes of the 1946 Session

SPEAKER ANDRESEN The first order of business is the approval of the minutes of the 1916 Session. SECRETARY ANDERTON I move that the reading of the minutes be dispensed with, and that they be approved as published in the July 1 1946, July 15 1046, and August 1, 1946 issues of the New York STATE JOHNAL OF MEDICINE.

Dr. Clarence G Bandler, New York I second that motion

There being no discussion, the motion was put to a vote, and was unanimously carried

(Sec 51) Section 4 Reference Committees

SPEAKER ANDRESEN Will the Secretary read the

Reference Committee appointments?

SECRETARY ANDERTON The Reference Committees for the 1947 House of Delegates are as fol-

SPEAKER ANDRESEN You have heard the list of Reference Committees and their Chairmon It is customary for those Committees to meet either immediately after this session, which I hope will be around half past twelve or one o clock or at some later time in the afternoon We ask that the Chairmen let Miss Dougherty know when they are going to moet so the list can be posted. We are going to have a list of the Committees, with their Chairmen and it is going to be posted by the door, with the time and place of their meeting noted thereon. I think it would be a very fine thing if anybody who is interested in any of the subjects that are brought up today or in any of the reports will go across the hall to the meeting of the appropriate reference com mittee and first fight out there what he has to say, so we will not have to take up so much time here tomorrow on the floor Very often motions that are made here on the floor amending committee reports could just as well have been raised and straightened out over in the reference committee meeting, and could have been disposed of there without taking

extra time to do so on the floor of the House We also would like the officers and council committee members who are concerned with any of the reports to hold themselves in readiness to come over and explain anything that they have written to the

reference committees.

We have heard from a few of the reference committees who are going to meet immediately after the

others are going to meet.

SECRETARY ANDERTON Mr Speaker, I move that the Reports and Supplementary Reports of Officers, Council Trustees and District Branches that have been published and distributed to the members of the llouse be referred to the respective reference

onunities without reading.

The motion was seconded by several
Da. Francisca W WILLIAMS, Bronz. On that
motion, the Bronx County Medical Society has directed me as one of its delegates in the discussion
of this motion, the country by the countr of this perennial motion by the Secretary to call the attention of all of the delegates to certain features of these reports, which Bronx County considers of

vital importance and worthy of deliberate consideration by each and every delegate during this 808810D

In the report of the Finance Committee a 1 recommendation to raise the dues is contemplated as a rider to the financing of our War Memorial

In the report of the Legislative Committee we were committed to the support of the Clancy Bill which specifically in the report of our Legis-lative Committee permits dentists and podiatrists to diagnose x rays of any part of the body

3 In the report of the Trustees, we wish to point

out it was necessary for us to pay for the audit of the Group Malpraetice Insurance Plan which the

House directed be made last year

4 Finally in regard to the report of the Mal practice Defense and Insurance Board and the resolution acted upon by this House at its last session I have been instructed to move an amendment to the motion of our Secretary that the report be read in full so as to inform all of the delegates and the mem bers of the Reference Committee that we may act intelligently tomorrow when the report comes before

In compliance with this specific instruction I so move you, Mr Speaker

SPEAKER ANDRESEN That will have to be an amendment to the motion already on the floor

Dr. WILLIAMS I am satusfied that it go through as an amendment

SECRETARY ANDERTON Does that contemplate

the reading of all the reports?

Dr. Williams No merely that of the Malpractice Defense and Insurance Board.

DR. THOUAS McCARTHY Bronz I would like to

second that amendment and then to speak on it.
Speaker Andresen The Chair rules that according to our regulations we are to refer any reports to Reference Committees and the discussions are to take place first in the reference committees and also if necessary are to take place on the floor when the reference committee is giving its report Therefore I consider that this particular amend ment is not in order

DR. WILLIAMS All I have done is to amend the motion that the Secretary made that we refer these reports and supplementary reports to the Reference Committees without reading. I have brought to the attention of the delegates several points that the Bronx County considers vitally important and also asked that one report be read Wo feel it is of such importance that every member of the House should be informed as to the details of it. That is all we aak in our amendment.

SPEAKER ANDRESEN May I also say that the Report of the Malpractice Insurance and Defense Board is going to be given in full later on this morning in the executive session. Will that satisfy you if that is given in full then?

DR. WILLIAMS It is going to be read before the

entire House?

SPEAKER ANDRESEN Yes.

DR. WILLIAMS Then that is satisfactory DR. J. STANLET KENNEY (Councilor) It is not

the intent to read the report in full at that executive session because the report has been circulated to every delegate. Each delegate has a copy of it. I have no objection to having it read in full, and am perfectly willing to have it done if the House so wishes, but I just wanted to clarify the situation that at the executive session it was not the intention to read the report

SPEAKER ANDRESEN Those reports have been distributed.

DR McCarthy Point of order I asked for the

floor to speak on the amendment SPEAKER ANDRESEN The report has been dis-SPEAKER ANDRESEN I don't know why we should have all of this discussion about reading it Everybody here, I hope, can read for himself the reports that have been distributed

DR WILLIAMS Can you assure me that every delegate here has read it?

SPEAKER ANDRESEN I don't know whether they have read it or not, but they are supposed to have read it

Dr. Williams That is what we would like to be sure of, Mr Speaker, that they are cognizant of what is actually contained in that particular report

DR THOMAS M D'ANGELO, Queens If the reports have been distributed we have done what we could for each individual delegate to bring them to their notice I don't see how this House can force each delegate to read the reports that have been distributed to him We carry out our duty and obligation when we see that each delegate gets a copy, and then it is up to him to read it. I have no objection to the report being read aloud now, but I think it is going to be a waste of time

Dr. McCarthy May I have the floor on this

amendment now?

Speaker Andresen Yes

DR McCarthy This amendment has been presented by Dr Williams, for the Bronx delegation, for several reasons This is the initial report of a Board created by the House of Delegates in 1946 We feel that the report is an excellent one, and that the distinguished and able members of this Board deserve our thanks They have been diligent, and they have produced something that is informative and comprehensive The reading of this report would be a fitting tribute to the Chairman of the Board, Dr J Stanley Kenney In the direction of this Board, as in his efforts with the preceding committee, Dr Kenney has labored long and earnestly He has never spared himself in his endeavor to serve this Society, and we feel that he deserves well of the Medical Society of the State of New York Read ing this report would, we feel, emphasize to the House of Delegates that in the possibly perilous years ahead for organized medicine loyalty of the membership based upon free and open information would be a stronger bulwark than that which is unenlightened and dissatisfied The Bronx delegation feels that the report is progress in the right direction

DR JOHN J MASTERSON (Trustee) In order to clarify the situation I would suggest that the Speaker request Dr Kenney to read the report in its entirety when the House goes into executive session later in the morning. Everybody has received a later in the morning Everybody has received a copy of the report, but I dare say many of the delegates have not read it. It is an important document, and I think it would refresh our memory if we

all heard it again

Speaker Andresen Is there any further discussion? If not, we will put the amendment to a vote that the report of the Malpractice Defense and Insurance Board be read in its entirety at the pres-

Dr. Joseph A Geis, Essex Those of us who have not read that report have the whole afternoon to Why take up the time of this body to read it over do that

The question on the amendment was called, and the amendment was put to a vote, and was

SPEAKER ANDRESEN Is there any further discussion on the motion to refer the reports and supplementary reports to the reference committees without

reading them in this House?

The question was called, and the motion was put to a vote, and was carried

Section 5 (See 92)

#### Supplementary to the Report of the Secretary

To the House of Delegates—Gentlemen

In conformance with a request from the Board of Regents of the University of the State of New York. the Council submitted the names of six members as nominees for two vacancies on the Medical Grievance Committee of the New York State Education Department The Board of Regents has recently appointed to membership on this Committee Dr William Walter Street, of Syracuse, and Dr Clarence Proctor Thomas, of Rochester

Respectfully submitted, W P ANDERTON, M D, Secretary

Section 6 (See 123)

#### Supplementary Report of the Board of Trustees

To the House of Delegates—Gentlemen

It is recommended that the House of Delegates direct

That a business survey be made of the greatly extended activities of the Society during the past eight years by a competent firm or other qualified persons, such firm-or persons to be chosen by the Council or a Committee thereof, appointed by the President of the Society, subject to the approval of the Board of Trustees, and under the direction of the Council, in order that the efficiency of the Society be increased, the relationship of expenditures of various departments to the over-all efficiency of the Society be evaluated, and such changes be made in the administration of the affairs of the Society by the Council upon the recommendations made in the report submitted after survey, subject to the approval of the Board of Trustees, as to the entailed expenditures only

That a new Committee of the Council be created entitled the Committee on Committees, to be composed of the Chairman of each of the Council Committees, the President, the President-Elect, the Past-President, and two additional members to be appointed by the President with the approval of the Council This Committee would act to coordinate all of the functions of the Council Committees so that unnecessary overlapping of functions would be diminished, integration of all of the work of the So-

ciety be made more efficient, and unnecessary expenditures be lessened

It is further recommended that careful consideration be given by the House to the fact that in the very near future the activities of the Society, limited as they must be by our dues income, must of necessity be diminished or the annual assessment of the members increased The Board desires to bring to the attention of the House the fact that the per capita dues of this Society are the lowest of those of any of the other State Societies of the United States comparable to the total State population or the total A list of the number of members of these Societies dues of the various State Societies will be furnished the House in the Report of a Committee of the Council

> Respectfully submitted, JAMES F ROONEY, M D, Chairman ALBERT A GARTNER WILLIAM H ROSS JOHN J MASTERSON EDWARD R. CUNNIFFE

#### To the House of Delegates-Gentlemen

The Planning Committee for Medical Policies has completed its fourth year of study and analysis of policies concerning medical practice. In this report particular emphasis is placed on those topics related to government in medicine.

1 Organization —The organization of the Com

mittee has been the same as in previous years Since the last meeting of the House of Delegates in May, 1946 in New York City the following gentle-

men have made up the personnel of the Committee

J Stanley Konney, M D Chairman, New York
William Hale, M D (deceased) Utica
Louis H Bauer M D, Hempstead
F Leslie Sullivan M D (deceased) Schenectady
A. A. Gartner, M D Buffalo
Walter P, Anderton M D, Now York
Leo F Simpson M D, Rochester
Norman S Moore, M D, Ithaca
Walter W Mott M D White Plains
O W H Wilchell M D, Syrgense O W H. Mitchell, M D Syracuse Peter J Di Natale M D Batavia

Invitations to the meetings were extended to Laurance D Redway M D, Literary Editor of the Journal Robert Hannon M D Executive Officer of the Society, Mr Dwight Anderson, Executive Secretary, Daniel Mellen M.D. Chairman of the Committee on Rural Medicine Joseph S Lawrence M.D., Director of the Washington office Council on Medical Service of the American Medical Asso-These gentlemen have honored us with their presence and their contributions to our de-liberations have been wise and constructive. The Committee is appreciative and hereby acknowledges its thanks to them.

In the proper place during this 1947 meeting of the House of Delegates appropriate tribute will be paid to those officers and members of the House whom God in His wisdom has seen fit to take from our midst. At this time we pause to record a reverent expression of our esteem and regard for the two members of this Committee who have passed to their Eternal Reward-our late President, Dr William Hale, and the late Speaker of the House Dr F

Leslie Sullivan. These colleagues served our Committee with distinction and wisdom. They are sorely missed and the memories of their genial per sonalities will live always in the hearts and minds of those of us whose privilege it was to know them and work with them Dr Bauer sponsor of this Committee who has been a member since its beginning, now serves in his capacity as President of our State Society and we welcome Dr Albert F R. Andresen, who, as the new Speaker of the House new becomes a valued member of this Committee

2 Overlapping Duties of Council Committees — On September 12 1946 the Council referred to the Planning Committee for study and recommendation the following excerpt from the minutes of the meeting of the 1946 House of Delegates of the Medical

Society of the State of New York

The overlapping suggested by the President in the work of the necessarily complicated system of committees of the Society has not been demonstrated to your Reference Committee but if In the opinion of the Council, such duplication of function does exist we recommend the creation of a special Council committee to study the matter and formulate such amendments to the Constitution and Bylaws as will remedy the situation.

Your Planning Committee has given these in structions from the Council careful study month the Council agenda carried the listing of thirty-seven committees and subcommittees some of which report regularly from month to month and some very infrequently or not at all. Study showed that much overlapping and duplication of effort was apparent and a streamlining of these many commit tees in the interest of efficiency and to expedite the already heavy work of the Council seemed neces-In the process of reorganization some committees have been dropped entirely others transferred to already existing standing committees and in three instances, the titles have been changed to bring them in conformity with existing and compar able American Medical Association Committees and with the work they are performing in the administrative set-up of our Society

We would recommend the following changes and adjustments

That the National Casualty and Indemnity Insurance Committee be discontinued

That the Committee on Revising Principles of Professional Conduct be discontinued and its duties and functions be transferred to the Committee on Questions on Ethics.

3 That the Committee on Veterans Affairs be discontinued

That the Committee on Woman Medical Student and Intern which was set up at the time of the war omergency be discontinued and its func tions transferred to the Committee on Public Health

and Education

5 That the Advisory Committee on Ophthalmological Problems be discontinued We felt that continuing this committee might be setting a precedent whereby perhaps every scientific section in the State Society might want a Council committee simi

lar in nature

6 That the Council Committee on Medical Service and Public Relations henceforth be desig nated as the Council Committee on Medical Service This Council Committee was created at the time the American Modfcal Association set up the parent council At the meeting of the House of Delegates of the American Medical Association held in San erally The interest now being evinced in it is rather a natural outcome of an evolutionary process and reflects today's trends in hospital planning in

general.

The functions of public health and preventive medicine and the functions of curative medicine, while each is an entity in the over-all medical care program, nevertheless, have much in common They require, first, the people who actually do the work—the general practitioners and the physicians practicing in specialties, second, the provision of facilities for doing the work adequately, third, the provision of the ancillary and follow-up services, and fourth, the provision of the administrative organization that will make those facilities and services most effectively available

For discussion purposes a tentative plan has been drawn up which possibly may form a pattern that could well apply to 22 to 24 other counties or areas of this State in the future if the level of interest that appears to exist at this time is maintained. This plan is prepared to serve the particular needs of Schoharie County. This county is one of the areas which our State Medical Society survey in 1945 selected as a prospective site for an experiment in the health center development. As most of you know, it is almost entirely a rural county, located in the Catskills southwest of Albany County. With a ratio of approximately 0.8 bed per 1,000 and 4.5 per 1,000 (3 in rural areas), as the generally accepted figure, we can say that this county's outstanding need is hospital beds, and, consequently, their request seems an entirely appropriate one. (See Appendix "C")

In the Schoharie County plan and in the future where a county might wish to build its health services, starting with the county hospital, it seems entirely justifiable, also, to expect that county to set its Public Health Services in order. It was agreed, after much deliberation, discussion, and conference that the requirements should be that a county has to organize a full county health district before it would be eligible for additional State and in the building of a county general hospital. That important

element is in this Schoharie County plan

The planning, then, envisages a 50-bed hospital to start with, excluding facilities for the chronically ill. with provisions for expansion to 75 beds—which it is believed would eventually be the actual need, also, provision for the inclusion of the county health department—to house it and such clinic services as it may have to operate, and provision for the proper coordination of the services of the hospital and the county health unit. The details of management both lay and medical, still remain to be worked out One of the requirements, however, is that there must be a regularly constituted medical board, just as in any general hospital, and all medical policies, staff appointments, ratings, etc., would devolve upon this board. There would also have to be arranged an affiliation with a regional medical center for the furnishing of the necessary teaching and consultative services The desirability of this relationship to maintain the quality of service in the hospital on the one hand and to enable it to take better care of more patients and to provide the doctors with a center to which they could refer the more complicated and highly specialized problems seems clearly established

The idea is to furnish regularly scheduled consultation services to the hospital staff, not to individual patients but to the hospital staff—in all phases of its operation. Perhaps a similar type of consultation service could be worked out in the field

of nursing administration and that of hospital administration as a whole. It has been suggested as a possible means of financing such service and to prevent unreasonable demands on the specialists' time that the hospital might reimburse these men from hospital funds and enter that expenditure as a legitimate hospital expense. It really is just that, a service to the hospital staff and not to individual patients

This coordinated planning for the integration of the county health department and the county general hospital is on a strictly voluntary basis. The time is appropriate, with these twin programs confronting us, for the Medical Society of the State of New York to reaffirm its endorsement, first of the development of county health units, and second, of the requirement that where State-supported county hospitals exist or may be planned in the future they contain a county health department. We would recommend that they reaffirm this position. Such action is in line with the platform of the American Medical Association.

The Committee is of the opinion that there would seem to be no need in this State for health centers of the so-called nursing unit type with beds for medical care that are included in the plans of the United States Public Health Service. We feel that it would be unfortunate to have health centers of that sort established throughout the State, as it would interfere with the above program of properly organized.

and planned hospitals

The Hospital Council of Greater New York, of which Dr John B Pastore is the Executive Director, is the counterpart for New York City of the Joint Hospital Board for the upstate area. They have made an exhaustive survey of all the metropolitan hospitals and ancillary facilities, and have recently released their report outlining the master plan for guidance in the development of hospitals and related facilities in New York City. It is not within the scope of this report to make any analyses or recommendations on this plan. It is being studied by the five metropolitan county medical societies and appropriate comment will be forthcoming in due time.

The plan was drawn by a committee of eleven authorities after two years of study It is offered in six major sections and stresses that facilities needed for adequate medical care of the people of the city should include, among other things, provisions for general hospital care, acute communicable diseases, convalescent patients, chronic and long-term illnesses, patients with tuberculosis and mental diseases, preventive medicine and ambulant patients Emphasis is placed upon the continuity of medical supervision and the services required by the people irrespective of their economic status The plan recommends, also, extension of present facilities for medical education and training to prepare physicians for present facilities for medical education and training to prepare physicians for present facilities for medical education and training to prepare physicians for present facilities for medical education and training to prepare physicians for present facilities for medical education and training to prepare physicians for present facilities for medical education and training to prepare physicians for present facilities for medical education and training to prepare physicians for present facilities for medical education and training to prepare physicians for present facilities for medical education and training to prepare physicians for present facilities for medical education and training to prepare physicians for cians for practice throughout the country cludes sections on medical research and group prac-Proposals to zone the city and set up regional divisions to bring about closer interhospital relationships are part of its recommendations. This master plan in its major provisions tends to do for Greater New York what the regional planning expects to provide for the State at large The physicians most provide for the State at large directly concerned with the developments of this plan should give it careful study It will bear close scrutiny

The program for the Care of the Chronically Ill is closely hooked up with the planning for new hospitals and expansion of facilities which has just been reviewed Certain principles regarding the care of the chronically ill are so well accepted that they can be considered to be beyond the controversial stage. For the hospital care of the chronically ill the best information that has been guthered up to the present is that between 11/2 and 2 beds per 1 000 population are the basic need. It depends a great deal on what other facilities are going to be made available. If no other institutional facilities are provided, more than that may be needed, but for the legitimate hospital needs of the chronically ill this is the basic number Applied to the Schohare pattern that would mean about 40 beds. Of course the hospital care of the chronically ill is only one phase and recommenda tions regarding improving the home care of these pa tients where the majority will be taken care of and the so-called in between care that is, between hospital and home some institution for those chronically ill persons who do not need hospitale are and who cannot be cared for at home will undoubtedly be forthcoming.

Any program ultimately developed must include education, research, rehabilitation as well as improvement of facilities for the care of chronic ill-

ness.

It must be a cooperative effort shared in alike by the medical profession the nursing profession, hospitals, and all other health and welfare agencies, and must encompass services for the prevention of chrone disease. The Health Preparedness Commission of which Mr Lee Mailler is the general chair man, has been developing for years the Biates a program for the care of the chronically ill. Because this planning is now in an advanced stage and the program nearing completion it would not be justifiable at this time to speak too definitely regarding it. We can, however support these general principles which have been stated

It may be said that the idea of the regional divisions of the State with a chronic descape hospital center as a focal point had its concept in this Commission, and for the purposes of planning this pattern will be followed. It will provide for the designation of special wings, wards, or fleers of general hospitals for the care of chronic illness and, in some instances for separate but contiguous buildings and some formal professional affiliation between such hospitals and the regional chronic disease hospital will be of feeted similar to the consultation services contemplated in the county hospital plan. This phase of medical care however has its own peculiar problems and will require broad perspectives as it reaches into the aspects of convalescent care nursing homes domicillary care and smilar services.

The trend today based largely on the war experence, is toward short hospitalization and this is becoming increasingly ovident in civilian practice. One form of military practice was to transfer patients to a convalencent or rehabilitation section when the acute or definitive stage of treatment was completed By this procedure beds were saved for acute patients and the patients transferred had the advantages of planned convalescent activities and rehabilitation training. Furthermore, the cost of building and operating convalescent homes is approximately half

that of acute hospitals.

The attempt has been made in these summanes to inform you of what is taking place today in hospital planning and related medical caro facilities and to feeus attention more shurply on vital aspects of the situation in our State. Our State Society, representing as it does organized medicine should be keenly alert to all these projects. We have a very definite stake in them. We must exercise the leadership and influence that is rightfully ours by furthering and

cooperating in the advancement and implementation of these plans.

5 United Mine Workers Welfare and Retirement and Health and Hospital Funds -A word of caution would seem appropriate in this report rela tive to possible developments that may grow out of the agreements regarding health practices and welfare and retirement reached between the United Vine Workers and the government in the recent coal mine disputes
promulgated one, the Welfare and Retirement rund, and two the Health and Hospital Fund. Boft coal is mined in 26 states The agreement does not concern New York State at this time except as it concerns the whole medical care problem of the United States Your Committee recognizes in these proposals a new type of economic philosophy which well may influence and possibly change the whole basic pattern of medical practice The principles embodied in these proposals will undoubtedly play an important role in collective bargaining in the future. Their probable extension into fields other than coal mining is obvious and we should be prepared to cope with this rapidly developing situation

The Taft-Smith Ball Donnell Bill -At the March 12 1047 meeting of your Planning Commit tee there took place very considered discussion of S-545 the Taft-Smith Ball-Donnell Bill generally referred to as the National Health Act of 1947 No statement on the Bill or analysis had yet been issued by the American Medical Association Since then, however there has appeared in the March 22 issue of the Journal of the American Medical Association an extensive analysis of the Bill with initial comment and a brief editorial reference. No public hearings as yet have been scheduled for this legislation. It is expected that when such hearings are announced representatives of the American Medical Association will be invited and an official pronouncement will be forthcoming It is hoped, also that constituent State societies may be accorded the privilege of tes-

tifying at these hearings.

With the philosophy of the Bill and with most of its objectives we are in accord. This proposed legislation goes along pretty well with the Program for Medical Care we have already adopted and are sponsoring, and it does afford the means of carrying out some of the provisions of our program. It undoubtedly will need clarification and amendments in certain parts. We feel at this time that we should withhold full approval of this Bill, emphasize our agreement with its general philosophy and purposes and leave ourselves free to suggest changes for improving it

We shall point out in this portion of our report only the highlights of the National Health Act. We urgo again careful reading of the detailed analysis which has appeared in the March 22 issue of the  $J \stackrel{\wedge}{A} M A$  just alluded to

The more aignificant proposals of the Act are

I To collect all the health activities that are now distributed among various government bureaus except those of the Army Navy and Veterans Administration into a single agency. Its administration would be a licensed physician outstanding in the field of modicine, selected by the President and approved by the Senate.

by the Senate
2 Under this physician-administrator of the National Health Agency would be brought the US
Public Health Service transferred from the Federal
Security Agency

3 Provision for including medical indigents in the program by the government paying the premium in voluntary hospital and medical care plans provides further for assistance by the government for those who can pay only part of the premium but

4 Provision for the use of certain funds for physician subsidies to attract and hold competent doctors in rural areas This ties in with the 10-point American Medical Association program It is purely voluntary No state has to come in on it if it does not desire to This provision should materially assist the problem of the better distribution of physiclabs

Emphasis on a medical survey to be conducted by each state to determine its true medical needs, this is patterned after the Hill-Burton Bill hospital These studies would draw \$3,000,000 in surveys federal funds and nould require matching funds

from each state

Provision for withholding from wages of government employees who desire to participate in a voluntary plan This provision is purely voluntary

Transfer of the functions and duties of the Children's Bureau to this agency, removing it from

the Federal Security Administration

Provision for dental health services and the inclusion of a special appropriation for the prevention and control of cancer

The Bill postulates that the National Health Agency shall be composed of the following

The Office of the Administrator

The Public Health Service, which in turn shall assume the administration of St Elizabeth's Hospital and Freedmen's Hospital The Office of Medical and Hospital Care

Services

The Office of Dental Care Services

The Office of Maternal and Child Health

The Office of Health Statistics

The Office of Food and Drug Administration

Such other constituent units as the Administrator finds necessary

All of these units would be ranked equally and nould rome directly under the Administrator of the

National Health Agency
The Director of the Office of Medical and Hospital Care Services would be a doctor of medicine, licensed to practice medicine in one or more states, who had had at least five years of active medical practice, and who was outstanding in the field of medicine would be in immediate charge of the medical grants-in-aid program. He would rank administratively with the Surgeon General of the Public Health

A National Medical Care Council, of which the Director would be a member ex officio, would consult with him in administering the grants-in-aid program. This Council would consist of eight members in addition to the Director, four of them physicians appointed by the National Health Agency ad-

This Bill, S-545, recognizes throughout the prin-

ciple of local responsibility and local control
7 Two other bills, S-140, known as the Full-bright-Taft Bill, and S-712, the Aiken Bill, have been introduced into the 80th Congress and hearings are being held on both

The Fullbright-Taft measure would create a Department of Health, Education, and Security in the Federal Government The new department would be administered by a Secretary of Health, Education, and Security to be appointed by the President, by and with the advice and consent of the

Senate, and by three undersecretaries similarly appointed The Undersecretary for Health would be a doctor of medicine "who shall perform such duties concerning health as may be prescribed by the Secretary or required by law" The Office of the Federal Security Administrator and the Federal Security Agency and its constituent units, together with all their powers, functions, and duties, would be transferred to the new department

S-712, introduced on February 26 by Mr Aiken of Vermont, is a bill to constitute the Federal Security Agency a Department of Health, Education, and Security It was referred to the Committee on Expenditures in the Executive Departments Bill would convert the Federal Security Agency into an Executive Department of Health, Education, and Security to be administered by a secretary with Cabinet rank and an undersecretary, and two assistant secretaries, all to be appointed by the President with the advice and consent of the Senate No provision is made for separate administration for the three included activities

These bills would interpose a lay intercessor between the health division in the new department and the President He could and probably would prescribe what the health and medical division or bu-

reau would do

Dr E S Bagnall, of the Massachusetts Medical Society testifying before the House Committee on Expenditures, told them that his state had tried combining health and welfare and it had not worked He contended that physicians were at a disadvantage with social workers in the matter of governmental setups. Social workers often were "on the career jobs which evolved these plans," whereas medical men were individualists who combined publie work with medical practice. He predicted that the proposed new Cabinet post of Health, Education, and Security would be foredoomed to failure He advocated the Taft-Smith-Ball-Donnell Bill setting up the National Health Agency, which, he

said, might develop into a Cabinet post Dr R L Sensenich and James R. Miller of the Board of Trustees of the American Medical Association testified, also, that health should have a cabinet post of its own They stated that the American Medical Association was opposed to the proposed Department of Health, Education, and Security and said, further, that if a Cabinet post for health was not now attainable the American Medical Associa tion would back the Taft Bill to create the new Na tional Health Agency They expressed the fear that if the field of health were combined in federal classi fication with education, now widely recognized as in need of more funds, and with welfare, also requiring more funds, "nothing will happen but stagnation" so far as health is concerned. They contended further that the lumping together of these three departments nould lower the quality of health services to the people Although the American Medical Association has long advocated a Department of Health with Cabinet status it is greatly concerned that such a post might be a step toward socialized medicine if unlimited power were put in the hands of a lay Cabi net secretary

We would reaffirm our position that health and medical functions within the federal government be under medical control. The thinking and planning of social and welfare workers and some spokesmen for organized labor are so predominantly at variance with the ideals and philosophy of American medicine that any such grouping of these functions as con-templated in this legislation would be detrimental to public and professional welfare alike It is logical to

assume that such an agency would be dominated by these groups in this country that would go all out for national compulsory sickness insurance. We should support atrongly those legislative proposals which would separate health and medical functions from the control of the Federal Security Agency

With the position of the American Medical Association in relation to this proposed legislation we are

in complete accord,

8 Group Practice—The Planning Committee in the 1946 report to the House of Delegates presented a general survey of this subject and included 'a set of principles for group practice approved by the Coordinating Council of the five County Medical Societies of New York as of November 1 1945' In summary the action which we took last year is as follows:

"These principles are incorporated in this report as Appendix B. They constitute a reasonably sound framework which should guide the organization of any group. The Planning Committee approves these aforementioned principles. Organized modleme is frequently criticized as opposing group practice. We should like to correct that impression. Medicine does approve group practice but insists it should be conducted on a highly ethical plane and should conform to such basic principles as those conformation in Appendix B.

"The Committee feels also that the formation of any group is entirely a local problem and should adapt itself to the cituation in each community We cannot recommend at this time any particular

type of group practice

An increasing interest in group practice is taking place because there is much thinking on this method of practice, especially by those younger physicians returning to practice after service in the armed forces and by the new graduates and young interns because of the indoctrination in this phase of practice they are receiving. Recently two bills passed the State Legislature and have been signed by the Governor One will permit physicians to practice in partnerships and to pool fees The other measure allows under the provisions of 0-C of the Insurance Law, the employment of physicians by nonprofit medical indemnity and hospital service corporations to treat persons insured by them. The State Society opposed this legislation not in principle, but because we felt that the bills were loosely drawn and opened up avenues for fingrant violations of medical ethics and that they would be contrary to the best interests of the public. It is not unlikely too that such a proposed system might cause a deterioration of the quality of modical and hospital care through the elimination of the principle of free choice of physician.

In the minds of the members of this Committee this subject of group practice is one in which the State Society should show increasing concern. We therefore recommend that this House of Delogates authorize the Council to have drafted suitable legislation to cover the matter of partnerships and group practice within the principles already approved by the State Society and that in the drafting of this proposed legislation other interested agencies be consulted and their aid and cooperation solicited.

In conclusion the attempt has been made to abstract and correlate from the mass of material coutsined in the minutes of the meetings of this Committee and in the proceedings of the conferences participated in by its chairman and others of its members the salient and perthent data which might

assist this House of Delegates in its deliberations and decisions. Annual reports, studies by similar groups working in these fields reliable press releases and other sources of information have been freely consulted. Although this has been no inconsiderable task, it has proved a stimulating one. Omissions have necessarily occurred nevertheless in its scope and detail the report is believed to cover the executial facts of those subjects which we have reviewed.

Uppermost in the minds of people today is socurity. Opportunity challenge initiative, seem to be forgotton words. The individual is being throttled for the blanket protection of the mass. The psychology of the times is to lull him with a sense of security and at the same time to take away the incentive and opportunity for individual initial tive. This road leads only to more and more regimentation and finally through logislative security to full State control

Medicine in this changing order must preserve and maintain its independence and freedom of action. This position is succincily and simply stated in the following quotation from the leading editorial in the NEW YORK STATE JOURNAL OF MEDICINE for April I

Medicane must preserve its fluidity it must be able to adapt itself functionally to the real, the demonstrable needs of a changing economy a changing social structure and to make its own constantly improved technology and practice readily available to the sick. It must be pealous of its own independence of thought and action but with out arrogance it must remain free from the clutching claws of a ruthless and stullifying bureaucracy it must scrutnize closely all proposals for change to be sure that such are practical and not merely apparently so "

The Chairman takes this opportunity to thank sincerely all the members of this Committee for the faithful attendance at its meetings and their valuable contributions to its deliberations. Without their fine cooperation this work could not have been accomplished

To Mrs. Augusta L. Grimm, Miss Doris Doug herty, and her associates on the office staff, also, go the thanks of the Committee for their loyal cooperation and assistance at all times

Respectfully submitted,
J STANLEY KENNET M D Chairman

#### Appendix A

The National Health Program of the American Medical Association

1 Minimum standards of nutrition housing, clothing and recreation are fundamental to good health.

2. Preventive medical services should be available to all and should be rendered through professionally competent health departments. Medical care to those unable to provide for themselves should be administered by local and private agencies with the aid of public funds when needed preferably by a physician of the patient's choice

3 Adequate prenatal and maternity care should be made available to all mothers. Public funds when needed should be administered by local and

private agencies

4 Every child should have proper attention including scientific nutrition immunization and other services included in infant welfare. Such services are best supplied by personal contact between

the mother and the individual physician but may be provided through child health centers administered locally with support by tax funds whenever the need

can be shown

Health and diagnostic centers and hospitals necessary to community needs are preferably supplied by local agencies When such facilities are unavailable, aid may be provided by federal funds under a plan similar to the provisions of the Hill-Burton Bill

Voluntary health insurance for hospitalization and medical care is approved, the principles of such insurance plans to be acceptable to the Council on Medical Service and to authoritative bodies of state

medical associations

Medical care, including hospitalization, to all veterans should be provided preferably by a physician of the veteran's choice, with payment through a plan agreed on between the state medical association and the Veterans' Administration

Research for the advancement of medical science, including a National Science Foundation, is

endorsed

Services rendered by volunteer philanthropic

health agencies should be encouraged

10 Widespread education in the field of health, and the widest possible dissemination of information regarding the prevention of disease and its treatment are necessary functions of all departments of public health, medical associations, and school authorities

#### Appendix B

#### General Recommendations to House of Delegates General Recommendations

The Council on Medical Service of the American Medical Association in its report to the present ses sion of the House of Delegates deals generally with this subject as follows

"At the request of the Board of Trustees, the Council has contacted the state medical societies in an effort to impress upon them the importance of preparing a plan of cooperation for putting into effect the provisions of the Hill-Burton law When the states have completed the hospital survey and the material has been placed in the hands of the American Hospital Association the results of these surveys will be utilized in developing a statewide hospital construction plan What part the medical profession plays will depend upon its preparedness and willingness to cooperate with other groups in utilizing funds provided for in the As a service to the states, the Council is preparing a statement of principles as a guide to such cooperation and a set of minimal standards for diagnostic clinic facilities Because of the extreme inportance of this program, the Council presents the following recommendations to the House of Delegates

"The importance of the Hill-Burton Hospital Construction law in the over-all program of medical and hospital care should be recognized by all

medical societies, state and county

"The medical profession, through its state and county medical societies, should be encouraged to participate actively in plans or programs formulated under the act

"This participation should include an early review of the membership of the advisory council to the state agency charged with the responsibility of carrying out the provisions of the law in order to determine the adequacy of medical representation. If necessary, action should be taken by the state medical association to obtain acceptable medical representation

"This participation should include a positive effort to see that local autonomy is maintained, that facilities are placed only where a specific need for them is shown, that any diagnostic clinic facilities be creeted only with the approval of the county medical society in whose area they are placed "

# DEPARTMENT OF THE VETERANS MEDICAL SERVICE PLAN, INC.

## Operation of Veterans Medical Service Plan

TWO questions have arisen recently—one, regarding the issuance of prescriptions by private physicians to veterans under the Veterans Administration Pharmacy Service Plan, and the other, regarding the Veterans Administration limitation on double appointments of doctors, dentists, and nurses, and on the annual salary which one doctor, dentist, or nurse may earn on a part-time or fee-basis through his association with the Veterans Administration

With reference to the first question, the circumstances are as follows. In issuing a prescription to a veteran under the Veterans Administration Prescription Service, a private physician is required to sign on the prescription a legend which reads, "I am authorized to treat and prescribe for the abovenamed VA beneficiary." Throughout the nation, it has commonly occurred that private physicians is sued prescriptions to veterans, with the signed legend, without actually holding an authorization from the Veterans Administration to treat the veteran for a service-connected disease or disability. In these cases, druggists have filled the prescriptions in good faith, only to have payment denied by the Veterans Administration because the veteran's treatment was not authorized.

It should be emphasized that a private physician should not issue prescriptions bearing the VA legend to veterans unless he holds a current VA authorization to treat the service-connected illness or disability for which the prescription is written Nonobservance of this rule may constitute a violation of

Federal Statutes

Any private physician who finds it necessary to prescribe for a VA beneficiary for whom authorization for treatment has not been obtained should

1 Mail, or suggest that the veteran mail, the prescription to the nearest VA medical installation

for filling, or,

2 If a medical emergency exists, mark the prescription "emergency" for filling locally, without signing the standard authorization legend Prescriptions marked "emergency," however, cannot be filled without cost to veterans under the terms of the existing VA agreement with the New York State Pharmaceutical Association The veteran in these circumstances may apply to the Veterans Administration for reimbursement of the cost of the prescription, which will be granted if the condition prescribed for is found to be service-connected

The second question of Veterans Administration policy is that which concerns the employment of part-time or fee-basis doctors, dentists, and nurses The main provisions of this policy are as follows

1 A limitation of \$6,000 is placed on the maximum per annum salary of physicians, dentists, and

nurses who are employed by the Veterans Administration on any but a full-time basis. This ruling applies to physicians who treat veterans under the Veterans Medical Service Plan of New York and receive fees from the Veterans Administration for their services. In addition, physicians employed on a part-time basis by the Veterans Administration are not to be permitted to treat VA patients on a fee-basis during the hours in which they are engaged in private practice.

2. The maximum \$6,000 applied select limitation.

2 The maximum \$6,000 annual salary limitation is applicable to individual doctors, dentists, and nurses regardless of the number of separate Veterans Administration appointments he or she may hold during the year and regardless of whether the appointments ran consecutively, concurrently, or remain separate and distinct. In addition, the limitation is applicable whether or not such separate appointments are held at different Veterans Adminis-

tration installations

3 Rates of pay for WAE (when actually employed) and per diem consultants and attending physicians are limited to \$50 and \$25 per day or fraction thereof, respectively. The \$6,000 maximum per annum salary limitation is applicable to consultants and attending physicians if they are appointed for a period of a year or more. If the appointment is for less than a year, the maximum limitation is prorated in accordance with the length

of their appointment
4 Doctors, dentists, or nurses may not hold
more than one type of appointment with the Veterans Administration at one time. This applies to
temporary, full-time, part-time, consultant, attending, or fee-basis appointments. However, at the
direction of the Branch Medical Director, consultants appointed on the rolls of the Branch Office (846
Broadway, New York City) may be utilized at different field stations when consultants in the same
specialty are not available at field stations when
their services are needed

5 Payment of both a VA fee and VA full or parttime salary is not to be made for service rendered at the same time or on the same day, regardless of how the doctor, dentist, or nurse is appointed or the circumstances under which the services were rendered

or emergencies included

6 Any exception to the policies outlined above must be initiated and recommended by the Manager of the Veterans Administration Regional Office under whose jurisdiction the services in question are performed

"Over Forty-five Years devoted to pleasing particular people"

### Robert Koch (1843 1910) proved it in bacteriology ..

koch showed in his postulates that he know the value of experience Specificity is demonstrated only when the microorganism (1) is present in all cases of the disease (2) can be cultivated in pure culture, (3) produces the disease in susceptibles on inoculation, and (4) can be recultivated in pure culture.

### Yes, and experience is the best teacher in smoking too!

The wartime cigarette shortage was a real experience for smokers. Millions of people smoked whatever brand was available—more different brands than they might ordinarily have tried in years. And from that experience so many more smokers close Camel as their cigarette that today more people are smoking Camels than ever before.

But no matter how great the demand we don't tamper with Camel quality Only choice tobaccos, properly aged, and blended in the time-honored Camel way are used in Camels.

According to a recent Nationwide survey:

# More Doctors smoke **Camels**

than any other cigarette

## NOW AVAILABLE AGAIN ...

HESODA

Supplied-in 71/2 grains with and with out Phenobarbital 1/2 grain in 5 grains with Potassium Iodide 2 grains and Phenoburbital 1/2 grain, and in 324 grains with and without Phenobarbital 14 grain. Capsules not enteric coated. ar available in the same potencies, for supplementary medication,

to control frequency and severity of attacks in CARDIOVASCULAR AND RENAL DISEASES and to prevent EDEMA

The ORIGINAL ENTERIC-COATED TABLET OF THEOBROMINE SODIUM ACETATE

Clinical experience and studies have proven the value of Theobromine Sodium Acetate in certain Cardiovascular and Renal Diseases In Angina Pectoris, used adequately, it permits more work by the individual without developing precordial pain or distress As one of the most effective Xanthine Vasodilators it helps increase the available blood supply to the heart and kidneys to increase the efficiency of these organs

It has also been found an effective aid in treating and preventing Edema of Cardiac or Renal origin. The enteric coating (especially developed for Thesodate) permits larger doses without the drug's contact with the Gastric Mucosa

# IN SLOW-HEALING WOUNDS

Indolent ulcers,

Indolent ulcers,
Burns, Infected
Surface wounds,
Non healing
Lesions

The value of local therapy in chronic skin ulceration lies in speeding up the healing process and there by shortening the period of disability, and in procuring an end result which is as nearly normal and free from dis figuration as possible

To these ends Morruguent and Morumide Ointments lend themselves admirably — The active ingredient of Morruguent is cod liver oil concentrate (with a 25% greater content of the unsaponifiable fraction than that contained in cod liver oil USP) In Morumide, sulfamilamide (10%) has been incorporated, in addition, for its bactericidal action

Cod liver oil lowers the vitality of pyogenic organisms, sulfanilamide is an active bactericide. These preparations prevent or retard infection on an ulcerated surface, reduce systemic absorption of toxic metabolites, hasten granulation and epithelization, and make for a pliable, elastic epithelial surface. Healing takes place with a minimum of surface disfiguration.

Morruguent and Morumide Ointments are indicated for topical treatment in chronic indolent ulcers, burns (of any degree), suppurating wounds, non-

healing amputation stumps, and similar lesions of the skin

Consistently Zero!

CLINICAL ADVANTAGE IN FEEDING THE PREMATURE

Because Similac, like breast milk, has a consistently zero curd tension, it can be fed in a concentrated high-caloric formula without fear of increased curd tension and lengthened digestive period. Hence, premature infants unable to take a normal volume of food may safely be fed a concentrated Similac formula supplying as much as double the caloric value (per ounce) of the normal dilution. The use of a concentrated formula often avoids serious loss of weight and manition in the premature infant, and permits a more rapid return to normal weight gain.

M & R DIETETIC LABORATORIES, INC . COLUMBUS 16, OHIO

SIMILAC

Similar to milk breast milk

A powdered modified milk product especially prepared for infant feeding, made from tuberculin tested cows milk (casen modified) from which part of the butter fat has been removed and to which has been added lactose coconnut oil cocoa butter corn oil and olive oil Each quart of normal dilution Similac contains approximately 400 U.S. I units of Vitamin D and 2500 U.S.P units of Vitamin A as a result of the addition of fish liver oil concentrates

# for the patient with distressing urinary symptoms

The prompt symptomatic relief provided by Pyridium is extremely gratifying to the patient suffering from distressing symptoms such as painful, urgent, and frequent urination, nocturia, and tenesmus

Pyridium, administered orally in a dosage of 2 tablets t.id, will promptly relieve these symptoms in a large percentage of ambulant patients, thereby permitting them to pursue normal activities without undue discomfort.

Since Pyridium acts directly on the mucosa of the urogenital tract, this important effect is entirely local It is not associated with or due to systemic sedation or narcotic action.

Therapeutic doses of Pyridium may be administered with little fear of serious toxic effects throughout the course of most cases of cystitis, pyelonephritis, prostatitis, and urethritis Literature on request.

For Speedier Recovery
In ANEMIA

Combining the therapeutic effects of iron with adequate amounts of other essential nutrients makes for speedier and more efficient recovery in hypochromic anemia

Frequent occurrence of multiple vitamin deficiencies in patients with hypochromic anemia makes it especially desirable to supplement specific iron medication with adequate amounts of all the lacking vitamins. Iron alone is inadequate.

The Heptuna formula is based on this rational approach to anemia therapy

# Putting <u>palatability</u> into <u>hig</u>h-protein diets

# Swift's Strained Meats

### Prepared originally for infant feeding now used extensively for special diet cases

Good food plays a psychologically as well as a physiologically important part in aiding recovery. This is one reason so many doctors are now using Swift s Strained Meats for patients on high protein low residue diets containing chemically and physically non irritating foods. Swift's Strained Meats provide a palatable natural source of complete high-quality proteins, B vitamins and minerals for patients whose condition prohibits the use of meats prepared in the ordinary mainer. Each of the six kinds beef lamb pork, yeal liver and heart offers a tempting distinctive meat flavor more readily accepted by patients even when normal appetite is impaired.

### Lean meat—strained fine enough for tube feeding

Swift s Strained Meats developed originally for feeding to young babies are prepared from selected lean U S Government Inspected Meats They are carefully trimmed to reduce fat content to a minimum. The meats are slightly

salted and strained so fine they will pass through
the nipple of a nursing bottle may easily be
used in tube feeding. Convenient to use—espe
cially for patients at home—Swift a Strained Meats
are ready to heat and serve! Each vacuum sealed
tin contains 3½ ounces of meat.

#### Swift's Diced Meats—tender julcy cubes

For soft smooth high protein and low residue diets these small cubes of lean meat offer new convenience and appetizing variety. Swift's Diced Meats are tender juicy pieces of meat easily mashed into smaller particles if desired. 5 ounces pet tin.

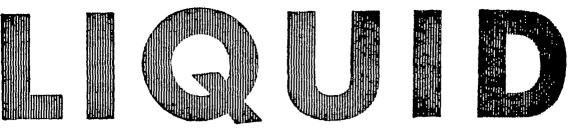

We will be glad to send you further information about Swift's Strained and Suff's Diced Meats with samples Write Swift & Company Dept BF Chicago 9 Illinois.

## Atomic Energy and World Health

Current emphasis as might be expected centers on the military aspect of the use of atomic energy The atomic bomb, with its potentialities as an instrument of destruction, has been demonstrated, pictured, exhaustively described in all its physical, political, and social aspects as perhaps no single military weapon has been before There is little probability that public ignorance of this phase of the use of atomic energy can still exist At the moment, official statements concerning the dangers of the uncon trolled use of fissionable materials seem to be realistic

This realism is commendable and will appeal to doctors If as citizens we have to prepare to use a new modality destructively. it is dangerous and futile to becloud the issue. Complete comprehension by the pubhe and forthright speaking by responsible officials are necessary and welcome expects immedate success in the procurement of permanent world peace by any arrangement that could be made But the United Nations has undoubtedly made considerable progress in many directions in the baleful ahadow of the atomic bomb

Elmo Roper has written pertinently 1

We are prone always to regard obstacles in the path of progress as both insurmountable and of a new kind-forgetting our history It might con sole those who are discouraged by the rocky na ture of the United Nations path to remember our own efforts to form the United States stitutional Convention was held in 1787 Sev. enty-four deputies had been appointed by twelve of the states-Rhode Island refused to appoint Only fifty-five attended and of these any fourteen left before the Convention closed and three more refused to sign During 1787, only three states ratified the Constitution—and one of these Pennsylvania, only by a 43 to 23 vote. Eight more ratified in 1788 but the proposition had a narrow squeak in New York, where the vote was 30 to 27 for adoption. It was not until 1790 when Rhode Island came through by a 34 to 32 vote that all thirteen original colonies ratified the Constitution

The union of thirteen colonies which had just finished fighting shoulder to shoulder for freedom and all of which had the advantage of a common language and lay side by side in one continent was not achieved easily nor without dissent. Cortainly we should not be too easily discouraged about the United Nations.

<sup>1</sup> N Y Herald Tribune, Sept. 8, 1946.

One of the most hopeful things the United Nations has done is to set up the World Health Organization Charter as a means of implementing one of its objectives

If one views the potential destructiveness of the atomic bomb, one should likewise consider its constructive possibilities

World Health A restless peace with its diminishing clash of armaments creates a partial vacuum Into it have been sucked and concentrated all the major disagreements of men and nations Together with the atomic bomb, these disagreements have received the lion's share of publicity what of the things on which men and nations can and do agree? These far outnumber their differences Yet, they, too, are threatened by the destructiveness of the atomic This fact may serve to correct some of the misconceptions concerning them that they are humdrum, lack drama, are drab and technical

World Health and its benefits have been singularly well served by Dr Thomas Parran, former Surgeon General, USPHS, and President of the International Health Conference, in his closing address last year <sup>2</sup>

The nations represented here today are signing a Magna Carta for health which will bring into being a world health organization unique in its scope, authority, and functions. Its broad purpose is the attainment by all peoples of the highest possible level of health and well-being. We are convinced that health is not merely the absence of disease or infirmity but a state of complete physical, mental, and social well-being—the enjoyment of which we declare to be a fundamental right of every human being without distinction of race, religion, political belief, or economic or social condition. We believe its attainment is essential for peace and security

It is becoming clear that the health sciences can contribute to man's ability to live harmoniously in a changing total environment. Thus, improved health enhances standards of living, promotes economic prosperity, contributes to our total objective, which is peace. The fundamental freedoms can be realized only when people are healthy and well nourished.

In the field of health, nations are interdependent Epidemics anywhere in the world are dangerous to other nations. Low standards of health lay a burden on prosperity and trade, im-

posing an economic handicap on every nation and on the world as a whole

The World Health Organization of the United Nations affords opportunity for an advanced kind of statesmanship heretofore too little utilized, but now encouraged and stimulated by the dramatic and pyrotechnic possibilities of atomic destruction if such statesmanship fails or is not utilized fully

Scientific Progress The enormous advances to be anticipated for medicine, the profound changes in industry, manufacture, home heating, air conditioning, are perhaps well, if only fragmentarily, illustrated in the following 3

The chain-reacting pile at Oak Ridge has used only five pounds of uranium in the production of atomic energy in nearly three years of operation, Dr W G Pollard, University of Tennessee physicist, declared today

Dr Pollard, a consulting scientist at the Government's atomic bomb plants, made the revelation at an atomic energy conference here sponsored by the University and Oak Ridge scientists

Comparing the production of energy chemically and through nuclear fission, Dr Pollard said the power plant at the university has required a ton of coal every two hours to keep it running, while one pound of lithium burned with hydrogen would keep it going for a year

In fact, there is a kind of furnace called a "pile" in operation now at Oak Ridge that produces just about the same amount of heat all the time as our university power plant does. That plant uses uranium as a fuel, though. It has been operating pretty nearly continuously for almost three years, now, and during that time it has consumed around five pounds of fuel.

Cities of the future will run their sanitary waste disposal systems as parts of their atomic energy power plants. Troublesome products now difficult to dispose of will become sources of desirable new materials for medical and household use

Homes, offices, factories, and streets will be illuminated by cold light, Dr Burton predicted Radioactive isotopes will bombard chemicals to produce intense light without much heat

New chemical processes for industry will result from the penetrating, high-energy radiation obtainable from atomic energy piles in large quan-

<sup>2</sup> New York, July 22, 1946

Address of Dr Milton Burton University of Notre Dame to the American Chemical Society, Sept 12, 1946 Dr Burton was formerly head of the radiation chemistry research in the atomic bomb development.

tities and at high intensities. Substances that usually cannot be made to combine will join together to form strange and useful products Dr Burton predicted

New drugs, new vaccines new radioactive dves are also forescen New kinds of plants and ani mals are other possibilities

The significance of chean and widely available energy to the advancement of human well being can only be fully realized by the kind of statesmanship which promotes the agreements of men until they prevail There is vet time

# Free Enterprise?

We have at hand a publicity release under the title "Plans Announced for Veterans" Hospital in Albany Expect to Complete Construction of 1,000 Bed Hospital by 1948"

It will be an eleven floor building, plus a separate utility building and residence building The construction will be under the direction of the New York District of the Corps

of Engineers.

Also according to the release, "Veteran patients will have a wide variety of services at their command, including a tailor shop, barber shop, billiard room, game rooms and libraries, a general canteen, including a soda fountain and restaurant, and a large auditorium in which motion pictures and other entertainment can be staged Another feature of the new hospital will be a limited number of guest rooms, reserved for patients' relatives who may want to visit the hospital and be close by without being bothered about hotel reservations '

The plan sounds wonderful We thought of what a contrast it presented to the old system of Soldiers' Homes, the equivalent aftermath of the Civil War We recalled the unsavory establishments that private enterprise caused to spring up about them. All the equivalents of the attractions listed above, plus the saloon We thought of the unsavory political connections necessary to the granting of such concessions. The concessionaires even used to provide attractive young girls who-no, no, please don't think that-were willing to marry the aging veterans. Of course the prospect of inheriting the husbands' pensions had no influence on the course of true love. If you don't believe this, inspect the records of the Pension Bureau What an advance over such con

ditions is presented by this new hospital presently to spring up at Albanyl

Then we thought of the restaurants, the cafeterias, the soda fountains, the news stands, the Coca Cola stands that we had gratefully patronized under the roofs of our most modern and progressive private hospitals We thought of the hotel accommodations—there can be no other name for them-offered to the anxious relatives of patients

But-and this is a very large but-all these luxuries were offered to us by private operators. Such proprietors, even if they be the hospitals themselves make their profits in competition with private enterprise because they operate under the roof of tax free institutions. Doubtless they are a great improvement over the nasty privately owned and operated enterprises that gath ered round the Soldiers' Homes like vultures round a corpse. But in principle they are nothing but extensions-or stretch ings, if you like-of the functions of the hospital that operates as a tax free, nonprofit institution. If we object to a hospital paying salaries to anesthetists, and thereby practicing medicine, why do we countenance hospitals going into the hotel, the amusement, and the restaurant business?

When the NEW YORK STATE JOURNAL OF MEDICINE is invited to insert an advertisement of an institution preparing to offer government competition with free enterprise, we think that the members of the State Medical Society might well do a little critical thinking about it Wedges being driven into the hull of the Ship of State, whether from the inside or the outside, whether from the purest or the most selfish motives, deserve careful scrutiny

# Current Editorial Comment

Metapon We have received from Dr Nathan B Eddy, a member of the Drug Addiction Committee of the Division of Medical Sciences of the National Research Council, a thorough account of and a recommendation respecting a new substitute for morphine, metapon hydrochloride. It is sponsored by the Committee on Drug Addiction of the Division of Medical Sciences of the National Research Council

It is recommended as possessing certain advantages which could make it the choice drug for treatment of the pam of cancer, especially in the home care of terminal cases, and for that purpose the Committee has recommended its manufacture and limited marketing

In terminal malignancy, administered orally, it gives adequate pain relief, with very little mental dulling, without nausea and vomiting, and with slow development of tolerance and dependence

It will be available only in capsule form for oral administration

Not only could we ill afford the space to explain just how metapon differs from morphine, but if we could it probably would be wasted space, for we don't believe our average reader would understand it any better than we

We are told that the drug is being manufactured by three firms and marketed by Its introduction to the medical profession is to be left in the hands of the National Research Council The careful, silent launching of this drug to the medical profession offers an agreeable contrast to the splashing debuts of others we can think To avoid the faintest implication of advertising, we simply state that any doctor interested in metapon, its chemical composition, what it does and doesn't do. who makes it, and from whom he can buy it need only write to Dr Nathan B Eddy, Committee on Drug Addiction, Division of Medical Sciences, National Research Council, 2101 Constitution Avenue, Washington 25, District of Columbia Readers' Digest and Paul deKruif, Ph D. may similarly inform themselves

The Public Education System For years the virtues of our system of public education

have been extolled by those who favored "state medicine" "Look," said they, "consider how well it works, how equitably for all It could be a model for a tax supported system of medical service Everybody would be better served Look at the noble school buildings, the excellent textbooks, the fine laboratories, the pension system, the compulsory education for everybody at everybody's expense"

Well, we have looked at it Certainly the plant and structure is good Textbooks are available. Athletic fields abound. Gymnasiums are provided. Sanitary facilities are of the best and usually well maintained. Bus service is available in rural and suburban areas generally. But what has happened to the teachers?

Daily we note that some are finding it necessary to take other jobs such as parttime bartending to supplement their miserable pittances as teachers, others are frankly quitting the profession

Public indifference to their reasonable requests for more equitable salary levels is in many instances discouraging superior talent from consideration of teaching as a profession and forcing out discouraged personnel who find it impossible to maintain a decent standard of living and their own self-respect at present salary levels

We hold no brief for commercialism in the professions. We have the greatest respect for the teaching profession. It has endured much, it deserves immediate rectification of gross salary inequalities before irreparable damage to its high quality and superior performance has been done.

We also take this occasion to point out again the inherent faults of government control and what inevitably happens thereunder where the professions are concerned. If the quality of teacher personnel and interest deteriorates, of what use are the buildings, the athletic fields, the good text-books, the noble plumbing fixtures?

Under, for instance, national health insurance schemes, would we not face the same discouraging factors? More important even than what government control can do for you, is what it can do to you

# Scientific Aiticles

### THE PRESENT STATUS OF BCG IN THE PROPHYLAXIS OF TUBERCULOSIS\*

MILTON I LEVINE, M.D., New York City

(From the New 1 ork Hospital and Department of Pediatrics Cornell University Medical College)

IN 1910 Calmette and Guérin announced that they had produced an attenuated strain of bovine tubercle bacilli capable of developing in cattle a marked degree of immunity against virulent tubercle organisms 1 During the eleven years that followed, numerous experiments on guinea pigs, rabbits, monkeys dogs, horses, and cattle proved this attenuated strain, the BCG bacillus, to be of definite protective value as well as incapable of returning to former virulence

In 1921 the vaccination of human infants was undertaken in France 2 and in 1924 the culture was offered for distribution to countries outside of France. Since that date over 5,000,000 chil dren have been inoculated throughout the world The majority of these vaccinations have been performed in various countries of Europe, Africa and Asia, although studies have been undertaken to a lesser degree in North and South America.

On the basis of these 5 000 000 inoculations, it can be stated that the vaccine properly prepared is entirely safe for human beings.

Numerous reports also have been published concerning the efficacy of the vaccine in the prophylams against tuberculosis The great majority of these reports are favorable but the actual degree of immunity conferred by the vaccine is still open to question.

In spite of this, wide publicity has been given the vaccine recently in medical journals, newspapers, and popular magazines. At the present moment plans have been completed already for its manufacture and distribution through certain centers in the United States. In the light of these developments it is important to study the experimental results of this inoculation and attempt to evaluate and summarize these results

The vast majority of the statistical reports on the efficacy of BCG unfortunately have been inadequately controlled A detailed report of most of these studies has been published already 3

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo General Sessions May, 7 1947

\* Alded by a grant from Meed Johnson and Company Evateville, Indiana.

In many of the studies controls were lacking completely in some the tuberculosis mortality rate of the general population was compared with that of the vaccinated group, in others a different age group served as a control, in certain stud ies the controls comprised cases where vaccina tion was refused in some there was a difference in age groups. In others the controls were less carefully followed than those vaccinated

More recently a paper has been published con cerning the results of BCG vaccination in Scandi navia. In all of the countries reported the results have been favorable, but again, the method of control selection appears inadequate.

In Oslo and in Bergen, Norway the tuberculosis mortality of the vaccinated group was compared with that of the general population In Stockholm, Sweden, where excellent results were reported by Wallgren, no controls were used. In answer to objections that no adequate controls were used, Wallgren stated that parents very seldom refuse to consent to BCG vaccination The studies in Norrbotten, Orebro, and Borans all in Sweden, were also controlled by the general population.

The vaccination also has been used extensively in Denmark, but controls are almost entirely lacking However, in spite of inadequate controls one cannot overlook the fact that with very few exceptions all the results have been uniformly favorable.

A number of reports have claimed efficacy for the vaccine on the basis of a reduction in pulmonary tuberculosis lesions on roentgenographic examination. This evidence is inadequate, since the vaccination acts as the primary focus of tu berculous and one should not expect to get the typical pulmonary complex on later exposure to tubercle bacilli From a roentgenographic point of view one should only judge the efficacy of BCG by its ability to prevent the caseous-pneu monic type of reinfection tuberculous.

Within the past year the greatest attention has been focused on three publications reporting ex perimental results with BCG inoculation in the United States These reports are "Experience with BCG Vaccine in the Control of Tuberculosis Among North American Indians," by Aronson and Palmer, "Ten Years Experience with BCG," by Rosenthal of the Tice Institute in Chicago, and "Results of BCG Immunization in New York City," by Levine and Sackett 3

The results obtained from the studies on Indians and those from the city of Chicago are favorable as to the value of BCG vaccine. The results in New York City are less favorable and statements concerning efficacy are guarded.

All three of these studies, however, are open to scientific criticism when viewed according to standards formulated as a result of the BCG research in New York City These standards set down as fundamental in the study of vaccine prophylaxis against tuberculosis are as follows

- 1 Vaccine must be of standard potency
- 2 There must be controls
- 3 Controls and vaccinated cases should
  - (a) Be selected by alternation to climinate possibility of bias
  - (b) Have identical follow-up
  - (c) Come from same locality
  - (d) Come from similar age group
  - (e) Come from similar racial group
- 4 Contact with cases must be maintained
- 5 Exposure conditions of cases must be known throughout the study period
- 6 A reliable diagnosis of the cause of death must be obtained

The results of the BCG study in New York City were extremely favorable prior to January 1, 1933 The mortality among the controls at that time was approximately five times as great as for the vaccinated cases (Table 1)

TABLE 1 —Results January 1 1933 Prior to Institution of Attenuate Selections

	Савез	Tuberculoris Number	Deaths Per Cent
Vaccinated Controls	445 545	3 18	0 08 3 38

Prior to January 1, 1933, the selection of cases for vaccination and controls was entirely at the discretion of the physician assigned to the case Under this system unintentional bias could easily enter into the selection, the tendency naturally being to vaccinate infants of the most cooperative families

Realizing this and on the advice of statisticians, the arbitrary division of cases was discontinued on January 1, 1933, and the method of alternate selection instituted. Under this method, alternate children were assigned for vaccination as soon as the names were received at the head-quarters and before they were given to staff pediaticians.

TABLE 2 —Comparative Results Before and After Alternate Selection

	Cases	Tuberculo Number	sis Deaths Per Cent
Total Cases BCG vaccinated Controls Cases December 15 1926, to January 1, 1933 (before alternate selec	1,011 1,073	11 26	1 08 2 42
tion) BCG vaccinated Controls Cases January 1, 1933, to January 1 ary 1 1944	445 545	3 18	0 68 3 38
(after alternate selection) BCG vaccinated Controls	566 528	8 8	1 41 1 51

The tuberculosis mortality results of this second period (January 1, 1933, to January 1, 1944) were essentially the same for both the vaccinated and control groups (Table 2)

Statistical analysis clearly demonstrated that the cooperation of the vaccinated group was appreciably greater than that of the control group prior to the period of alternation, with much closer approximation in the latter period. These results obtained in a carefully controlled experiment, nevertheless, are open to the following criticism.

According to published reports, the BCG culture used in this study became contaminated by molds late in 1932 necessitating considerable effort before pure cultures were once again obtained through the use of the antiformin method and plated on media containing aniline dyes Meanwhile subcultures were obtained from the Phipps Institute (which had received a strain of the New York Culture in 1926) These subcultures were used alternately for vaccine for one year, following which both cultures were used without selection Virulence tests were made at three-month intervals, but no tests were made for potency It is not beyond the limits of possibility that the original culture of vaccine was diminished in potency following the efforts to eradicate the molds

Ideally, a child should be separated from a tuberculous focus for three months before the prevaccination tuberculin test to prevent moculation during the preallergic phase of tuberculosis. On the other hand, the child should be separated for from six weeks to three months following the vaccination in order to permit the formation of adequate immunity before exposure to virulent human tubercle bacilli. Such a procedure was found impossible for general adoption in New York City

However, in a limited number of cases where such separation was possible, there was some in-

TABLE 3 -- Exposed Cases Separated Three Months Before and Three Months After Being Vaccinated on Taken Up

dication that BCG inoculation had protective value (Table 3)

The studies on Indians' were undertaken at eight different reservations in Vestern United States and in Alaska Approximately equal numbers of Indians were selected for vaccunation and controls. The results are reported in Table 4.

In these studies cases were not alternated and in writing of the method of selection it is stated that "its, of course, not possible to be certain that no bias was unintentionally introduced"

Furthermore, in the Indian experiment, the diagnosis at death is open to question since it is published that "in the control group some of the deaths which were assigned to nontuberculous causes actually may have been a consequence of tuberculosis." The New York studies clearly demonstrated the necessity of postmortem examinations for accurate diagnosis.

Also in these studies on American Indians several methods of cultivating the vaccine were used, and in explaining a discrepancy in results at one of the reservations it is stated that "these relatively poor results may be attributed, perhaps to the fact that the three lots of vaccine used on this reservation were prepared from a slow growing culture and probably contained many dead organisms"

The arbitrary rating of exposure is also open to criticism as is the lack of separation from contact cases. However, the results of these studies clearly are favorable and must be added to the long list of such reports.

The report of ten years experience with BCC in the city of Chicago also is favorable. This is a well-controlled study in which alternation was used and in which cases were separated before and after vaccination and controls separated in similar manner. However, in this study the exposure to tuberculosis frequently is unknown after vaccination, and a considerable number of the children have been lost. No information has been published in this study concerning the racial proportion among the vaccinated and control groups although of the ten tuberculous deaths as of April 1940, seven were of negro children. But, again the results are definitely favorable.

Within the past few years the opinion has be-

come more and more accepted that the response to a primary tuberculous complex in the young adult is much more sovere than the response in infancy and childhood, that in young adults the primary infection may, at times progress rapidly into the severe and dangerous caseous-pneu monie type

If this opinion is correct then the inoculation with BCG of tuberculin negative preadelescent children should be of the greatest benefit since it provides the body with an inocuous primary complex and through this, a protection against the primary tuberculous inflammation of the lungs from exogenous sources

Since the recent publicity, numerous inquiries have been made concerning the vaccine. What people may be vaccinated? What degree of effectiveness is claimed for the vaccine? How long does the vaccination remain effective? How is the vaccine administered? What reaction follows vaccination? Can the vaccine be obtained for use in general practice?

In the first place it must be emphasized that the vaccine is used only for prophylaxis against tuberculosis and not for treatment of the disease. Use of the vaccine is limited to individuals with negative tuberculin tests

The actual degree of immunity conferred by the vaccine is not known at the present time. However judging from the results of even the most favorable reports one would conclude that immunity is not complete, as it is with smallpox diphtheria or typhoid inoculations. Although a certain degree of immunity is indicated a number of tuberculous deaths may still be expected among vaccinated persons.

The duration of the immunity following vaccination is also not determined although many authors believe that immunity remains as long as the tuberculin test resulting from the vaccina tion remains positive. Others, however contend that the tuberculin sensitivity and immunity are not related and that immunity persists in spite of the loss of tuberculin sensitivity

It is now felt generally that a potent culture of

BCG vaccine properly administered should cause the development of a positive tuberculin reaction in a very high percentage of the cases, but, again, results vary considerably

In the Chicago study the tuberculin test following BCG inoculation became positive in 99 62 per cent of the cases. At the end of fifty-five to sixty months the tuberculin test was still positive in 70 09 per cent of the children. Overton in Nashville, Tennessee, reported the development of tuberculin allergy in 100 per cent of 4,679 subjects <sup>8</sup>

The paper on the American Indian study reports only 56 per cent positive tuberculin reactions to the stronger dilution of a purified protein derivative (0 005 mg) one year after vaccination. The New York study reported 86 per cent tuberculin positive one year after vaccination.

This discrepancy in findings may be due to the amount and potency of the vaccine used, the method of inoculation, the manner of tuberculin testing, differences in racial groups tested, or the opportunities for contact with human tubercle bacilli

In public health projects it seems advisable that vaccinated persons be tuberculin-tested two months after vaccination to determine that the vaccination has taken, and retested every two years thereafter Tuberculin-negative persons should be revaccinated

Certain other important information concerning the reported efficacy of the BCG vaccine is still lacking. Among these are the effectiveness of the vaccine under varying degrees of exposure, the effectiveness of the vaccine in different age and racial groups, with various degrees of resistance, the effectiveness of the vaccine when prepared with different culture media.

The vaccine is administered in one of three manners the multiple puncture method, the scratch, and the intradermal method. A local lesion follows, which at the most leaves a scar resembling that of vaccination against smallpox. In a certain number of instances of intracutaneous inoculation, suppuration of the lymph nodes draining the area may result. This subsides in a few weeks. No fever is associated with the vaccination and no pain or disability.

It would seem that until further knowledge is obtained concerning BCG that it still be given in a semiexperimental manner, and that its distribution be limited to medical colleges, public tuberculosis hospitals and clinics, and to selected additional hospitals and institutions under the supervision of trained personnel.

The vaccine should be recommended for experimental use where there has been a known exposure to tuberculosis or where exposure is likely to occur, in groups occupationally exposed, such as nurses and medical students, and in selected population groups with high tuberculosis morbidity and mortality rates

In these studies it is important that eareful records be made and filed for further analysis, and that there be adequate opportunity to follow both controls and vaccinated patients over a period of years

# Summary

- 1 On the basis of over 5,000,000 BCG inoculations on human beings throughout the world, it can be stated that the vaccine properly prepared is entirely safe for human beings
- 2 Numerous favorable reports have been published on the efficacy of the vaccine but with very few exceptions these studies have been poorly controlled
- 3 The many favorable reports, though not conclusive, would seem to indicate that the BCG vaccine may be effective in the prophylaxis against tuberculosis
- 4 In view of these numerous, favorable reports and in view of plans for distribution of the vaccine in the United States, it is important that our present knowledge concerning the vaccine be further evaluated
- 5 Further knowledge is needed concerning (a) the actual degree of immunity conferred by the vaccine, which is not known at the present time, (b) the duration of immunity following BCG moculation which also has not been determined, (c) the effectiveness of the vaccine under varying degrees of exposure, (d) the effectiveness of the vaccine in different racial groups with various degrees of resistance, (e) the effectiveness of the vaccine when given to various age groups, and (f) the effectiveness of the vaccine when prepared with different culture media
- 6 It is to be advised that until this further knowledge is obtained, the vaccine be distributed and used in a semiexperimental manner

# THE PHARMACOLOGY, PHYSIOLOGY, AND CLINICAL EVALUATION OF THE NEW ANTIHISTAMINIC DRUGS (PYRIBENZAMINE AND BENADRYL)

CARL E ARBEMIAN, M.D., Buffalo, New York

(From the Buffalo General Hospital and Buffalo Children's Hospital University of Buffalo, School of Medicine)

THE development and clinical use of potent antihistaminic and antianaphylactic drugs in the treatment of allergic diseases is probably the greatest advance in the therapeusis of allergy since the discovery of epinephrine in 1901

Since Dale and Laidlaw<sup>1</sup> in 1910 pointed out the close resemblance between histamine shock and anaphylactic shock in guinea pigs, and Lewis <sup>1</sup> in 1927, postulated that a histamine-like substance, which he designated as H substance, was liberated by the tissues of humans at the site of the allergic reaction, attempts have been made to find some nonspecific substance which would inhibit all anaphylactic and allergic reactions, no matter what the antigen happened to be

In recent years, further evidence has been accumulated to support the histamine theory of al largic manifestations Dragstedt' and Code' have ably reviewed the literature on this subject. Suffice it to say, enough data have been obtained to use this theory as a working hypothesis to explain the mechanism of an allergic reaction The theory is illustrated in a somewhat simplified form in Fig. 1 This scheme presents various avenues of therapeusis for allergic conditions in man. The primary and foremost method would be to prevent the antigen-antibody reaction by eliminating the offending allergen where possible -such as a food or net which causes the symptoms. The patient with ragweed hay fever could move to a ragweed free area but this is not always practical In many instances, it is obviously im possible to eliminate these factors.

When the allergen cannot be removed, another method, called specific hyposensutiration, preventing this antigen-antibody reaction can be employed. A thermostabile or "blocking" antibody is produced by injecting small, increasing doses of the offending allergen into the patient. This new antibody then reacts with the allergen and prevents it from reaching the antibody at the abock organ

A third approach to the treatment of the al lergic reaction would be aimed at altering the action of the end product of this allergen-anti body reaction, namely, histamine This might be achieved by means of one or more of the possible methods proposed by Dragstedt.<sup>3</sup> They may be outlined as follows

1 By opposing the pharmacologic action of histamine through stimulation of the sympathominetic system (epinephrine)

2 By direct action (relaxation of bronchial

musculature)

3 By preventing the release of histomine

4. By direct chemical combination with neutralization of histamine introduced or liberated at the site of action

5 By blocking the action of histamine

As early as 1932 Hill and Martin' listed 105 substances or methods which had been used to attempt to inhibit anaphylans. Some of the substances listed were ether, atropine, banum, chloral, and benzene in large doses. However most of these were either too toxic or impractical to use clinically

Within the past decade the amino acids—arginine, histidine, and cysteine—were shown to have antianaphylactic and antihistamine properties. Histamine histamines, and histamine axoprotein have been studied thoroughly and reported to be antihistaminic and antianaphylactic. All of these substances have been used clinically, but the results obtained with them have been disappointing

In 1937 Bovet and Staub studied a group of chemical compounds and found two which had marked antihistaminic and antianaphylactic properties. These substances thymoxyethyldiethylamino and N'-phenyl N-ethyl N'-diethyl ethylenediamine, were designated 929F and 1571F, respectively (The chemical formulas of these drugs and the ones to be described below are shown in Fig 2) These compounds how ever, were too toxic to use clinically

Halpern, in 1942 described his observations with two new compounds. One of these, N'-dimethylamine ethyl N'-bensylaniline (also known as 2339RP and antergan), was investigated by many European workers \*-12 This drug was found to be more effective and less toxic than 929F or 1571F, and hence, was used clinically in the treatment of various allergic conditions. Promising results were reported.

More recently Bovet and associates described a new drug N P methoxybonsyl-N-dimethyl-

ammosthyl and aminopyridine (neoantergan or compound 2786RP) <sup>12</sup> This drug is claimed to be more potent and less towe than antergan Bernstein, Rose, and Feinberg<sup>14</sup> found neoantergan to be quite effective clinically

In the past few years intensive research has been underway in this country in an attempt to find more effective and less toxic compounds with antihistaminic and antianaphylactic activity Two such drugs have been investigated thoroughly both clinically and experimentally, by many workers, and are now available for clinical use They are N' pyridyl N' benzyl N-dimethyl ethylenediamine (pyribenzamine, Ciba) and beta-dimethylaminocthyl benzohydryl ether hy drochloride (benadryl, Parke-Dayis) drugs are very similar in action. The present report will describe our clinical and experimental experiences with pyribenraming since November. 1944, and compare our results to those of other workers using either pyribenzamine or benadryl

The exact mode of action of these substances is not known. Mayer postulates from his work that these compounds compete with histamine at a given sate of action or receptive substance. This so-called displacement theory has been thought to account for other types of antagonism such as the atropine acetylcholine system, and the para aminobenoic acid, sulfonamide system

The phamacologic properties of pyribenzumine are described by Yonkman <sup>14</sup> He says that pyr benzamine counternets histamine-induced 'asthma in guinea pigs, contraction of bronchi in dog, hypotension in the dog, contraction of intact dog intestine, and salivation in the cat. It also counteracts anaphylactic shock in the guinea pig construction of the bronchi in perfused lung of guinea pig, hypotension in the dog and construction of the intestine in the dog. Other actions include analepsis local anesthesia, and adrenergic potentiation

Following the administration of pyribensamine Mayer was able to protect guinea pigs from histamine and anaphylactic shock. Arbesman, et al., demonstrated this same action using passively sensitized guinea pigs 18 Feinberg and Friedlander showed that pyribensamine was six times as effective as beindryl in protecting guinea pigs from histamine shock and about equally as effective against anaphylaxis. It was also shown that pyribenzamine had no effect on precipitin or complement fixation reaction titers 19

Most investigators found no change in the acid concentration of the stomach after histamine, if it were given after the administration of either of the two antihistamine drugs \*11 Furthermore,

furnished through the courtesy of Ciba I have accentical incts Inc. Summit New Jrs y

no noticeable changes in blood prossures, blood chemistry, cell counts, liver, and kidney function tests were noted in either humans or dogs, fol lowed over a period of twelve months <sup>12</sup> Curry recently has shown that the diminished vital capacity asthmatic patients develop following histamine injections is prevented by both infravenous benadryl and to a lesser extent by oral puribenzamine <sup>23</sup> Arbesman, et al., have fur their shown that pyribenzamine decreases the size of lustamine wheals allergic wheals, and passive transfer wheals <sup>13</sup> This work has been confirmed by Funberg and Friedlander <sup>23</sup>

#### Clinical Experiences

Dosage and Tolerance -The effective dosage of pyribengamine and benadryl was found to vary greatly from individual to individual also varied in the same patient at different times depending upon his allergic state and the degree of exposure to the offending allergens average adult dose for pyribenzamine varied from 100 to 400 mg daily and the dose for children from 50 to 200 mg At times, as much as 1,200 mg of pyribenzamine was given to adults in a twenty four hour period without any untoward effects It has been our experience that children tolerate this drug very well Benadryl dosage in adults varied also from 100 to 400 mg daily children 40 to 80 mg of benadryl was prescribed Both pyribengamine and benadryl are given orally and usually in four daily doses, after meals Benadryl may be given intravenously if necessary Pyribenzamine often produced relief of symptoms within fifteen to twenty minutes The duration of the effect of this drug showed con siderable variation. Some patients reported rehef lasting as long as eight to twelve hours, whereas others had relief of only one to three hours

E Seasonal Allergic Rhamits—During the pollen seasons of 1945 and 1946, we treated 288 patients who had allergic rhinitis caused by the grass or ragweed pollens with pyribensamine Table 1) Of this group 244 or 84.6 per cent, had relief of symptoms There was less sneezing rhinorthea, and itching eyes, but the nasal occlusion was not allevanted as much. The reports in the literature reveal 52 to 82 per cent or an average of 70 per cent improvement with pyribenzamine, \*\*\* and 10 to 80 per cent, or an average of 68 per cent with benadry! \*\*1-28

pyribenzamine The reports in the literature reveal 6 to 35 per cent, or an average of 23 per cent improvement with pyribenzamine<sup>26-20</sup> and 10 to 65 per cent, or an average of 43 per cent with benadryl <sup>21-38</sup> (Table 4)

# The Effect of Pyribenzamine on Urticaria

Eighty-four patients with acute urticaria were treated with pyribenzamine and 79 were benefited. Of this group, 24 patients had postpenicillin urticaria and arthralgia. Twenty-three of these 24 patients whose lesions appeared anywhere from three days to three weeks following the cessation of penicillin therapy had dramatic relief of symptoms (Table 5).

One hundred and fifteen patients had chronic urticaria, dermatographism and/or angioneurotic edema. Of the group, 68 per cent had alleviation of pruritus and decrease in size of wheals, swelling, and erythema following pyribenzamine therapy. The reports in the literature reveal 60 to 96 per cent, or an average of 78 6 per cent improvement with pyribenzamine 25-30 and 61 to 100 per cent, or an average of 79 8 per cent with benadryl 21-38

# The Effect of Pyribenzamine on Miscellaneous Conditions

Several other conditions were treated with pyribenzamine (Table 6) Inasmuch as a marked antipruritic effect was noted in the treatment of urticaria with these drugs, they were prescribed for various dermatoses. Fifty-seven per cent of 21 patients with atopic eczema and 4 of 7 patients with infantile eczema had definite relief of itching. However, in dermatitis venenata, only 6 of 20 patients benefited from these substances. Pruritus am and vulvae was relieved in

TABLE 7 -SIDE-EFFECTS OF PYRIBENSARINE

Total number of side-effects -- 374 \* Had to stop drug.

3 of 4 patients as were 2 of 3 patients relieved of itching from saundice.

The treatment of migraine, histamine cephal ga, Meniere's syndrome, and allergic headaches with pyribensamine was very discouraging Only 2 patients of the entire group of 12 patients received any beneficial effects. The same type of experience, for the most part, is reported in the literature for both pyribensamine and benadry! However, 2 patients with gastrointestinal allergy were improved with pyribensamine, while no effect was observed in 2 others with the same con dition.

#### Comment

Sub-Reactions —As noted in Table 7 72 7 per cent of the 800 patients treated with pyriben namine had no untoward effects. A total of 44 patients or 5.5 per cent, had to stop the drug because of the severity of the sub-effects. There were 218 patients who had a total of 374 untoward restrous. The most frequent side-effects en countered from this drug were drowsiness, nausea, headache, fatigue, and dissiness. All of these various side-effects, their relative frequency, and incidence are listed in Table 8

It is interesting to note that patients receiving large doses of pyribensamine had aide-reactions more frequently than the patients receiving small or moderate doses. In many instances these untoward reactions could be circumvented by decreasing to a smaller but still effective dose. There was also a rather marked difference in individual tolerance to pyribensamine. Several patients were able to tolerate as much as 1,200 mg.

daily without ill effects, whereas, in a few others as little as 25 mg produced undestrable reactions. Many patients having symptoms of drownness upon first taking pyribenzamine were able to tolerate it without reaction after continued usage

Teinberg in his review on antihistaminic substances stated that about 50 per cent of the patients taking benedryl had some untoward reactions, whereas between 25 to 30 per cent of the patients receiving pyribenamine complained of some side-effects. The most disturbing side-effect of boundryl is marked drownness whereas the most annoying ill effects from pyribenamine are gastrointestinal complaints, i.e., nausea, emesis or diarrhea.

One of the reasons for the increased effectiveness of pyribenzamine as compared to benndry may be that larger doses of pyribenzamine can be given without as many side-effects. However in many instances patients who could not tolerate one drug could take the other with benefit. In addition to this, benndryl might be more effective in a certain patient, whereas pyribenzamine might be more effective in another. At times the seds tive action of beandryl is desirable and I have often given patients pyribenzamine during the day and beandryl at bedtime.

#### General Effects of Pyribenzamine in Allergic Patients

There is no doubt that the antihistaminic drugs relieve the symptoms of lacrimation rhinorrhea, and sneezing in allergic rhinitis. The nasal blooking, which is often associated with this condition, is not too readily alleviated. Likewise, when there is a superimposed infection on an allergic rhinitis, pyribenamine and benadryl are less effective. At times large doses of these

	By Intr-	39	24	61

drugs are necessary to control symptoms This is usally the case when the pollen counts are highest. With the increased dosage there is an associated increased percentage of side-effects

In a recent study we compared the efficacy of pyribenzamine alone with specific hyposensitization therapy plus pyribenzamine when necessary in the treatment of ragweed hay fever (Table 9) "Sixty-seven per cent of the patients receiving pyribenzamine alone were helped, but with specific hyposensitization therapy and pyribenzamine when needed, 91 per cent received relief of symptoms. In this latter group much smaller and less frequent doses of pyribenzamine were necessary to control symptoms, and the incidence of side-effects int his group was negligible

When bronchial asthma is associated with allergic rhinitis, in most instances the bronchial symptoms are not relieved In 8 such patients. although the allergic rhinitis was alleviated. the bronchial symptoms were aggravated a smaller percentage of cases, we have noted that pyribenzamine produces some bronchial relaxing effect in asthma This is more evident prophylactically than therapeutically benzamine is given one-half to one hour prior to exposure to an offending allergen which ordinarily produces asthma, the symptoms are usually pre-However, once the symptoms of bronchial asthma have developed, the degree of relief obtained by oral pyribenzamine is not nearly as dramatic as that of epinephrine or aminophylline However, we have shown that there is a definite synergism between pyribenzamine and ephedrine, and/or aminophylline 45 When both of these drugs are given together, the effect on the symptoms is greater in intensity and duration than if either drug were used alone

Mayer 16 recently demonstrated that a 2 per cent aerosol spray of pyribenzamine prevented histamine shock in guinea pigs. In the past few months we have used a 2 per cent pyribenzamine saline solution as an aerosol spray in the treatment of acute paroxysms of asthma. A De-

Vilbiss number 40 nebulizer was used and the patient instructed as to its use. Two cc of solution was placed in the nebulizer and the patient was advised to inhale until relief of symptoms was obtained. Although the number of patients so treated is small, the results look very promising. Of 12 patients with true extrinsic bronchial asthma, 7 obtained instant and dramatic relief of the acute paroxysm. Its effectiveness seems equal to, or superior to, epinephrine 1–100. The only side-effect noted has been dryness of the mouth However, we used this same method of therapy in intrinsic asthmatics and extrinsic asthmatics with infection, and no benefit was noted.

We have also noted and reported that pyribenzamine can prevent constitutional reactions in patients receiving injection therapy <sup>47</sup> Allergic reactions to injections of liver extract and insulin frequently can be prevented by the prophylactic administration of pyribenzamine. Urticaria due to cold or sunlight is prevented by the use of these drugs prior to exposure. These histamine antagonists do relieve the itching of the skin and reduce the wheals and erythema in urticaria to a marked degree.

The remarkable and sometimes surprising results obtained with these drugs are only palliative As soon as the medication is stopped, there is a recurrence of symptoms These substances probably do not immunize the patient or protect him from the effects of an allergic reaction for any prolonged period Therefore, it is important for the allergic individual to continue with his allergic The causative agent should be determined when possible and specific hyposensitization therapy instituted We have shown that one obtains the best results with combined allergio therapy and the histamine antagonists when indicated 44 In many instances it is often impossible to find the etiologic agents of an allergic reaction and it is here that these new substances have their greatest value

The good results from antihistaminic substances in allergic conditions, particularly of the true atopic, wheal-like reaction, such as urticana, extrinsic rhinitis, and physical allergies, indicate that histamine must play some definite role in an allergic reaction It is the general consensus of opinion among investigators that histamine is not the only factor in allergy or anaphylaxis This may account for the lack of response in all types of allergic disorders It may be due to this fact, or that not enough histamine antagonist reaches the site of the allergic reaction, that so many failures in bronchial asthma occur ever, our recent experience with nerosol pyribenzamine indicates that very small amounts of the drug administered directly to the site of action, the tracheobronchial tree, can relieve in-

TABLE 10 -SUMMARY EFFECT OF PUBLISHMENT

	Number of	Number Improved	Percentage Improved

stantly an acute paroxysm of asthma Thus would tend to substantiate the theory that the antihistaminic drugs work on a competitive basis with histamine at the end organs The failures obtained with these substances in intrinsic asthma would indicate that some other mechanism besides historine accounts for the symptoms

The present antihistaminic drugs available are by no means ideal. The side-reactions are too frequent and the results obtained in all allergic disorders could be better Intensive investiga tions are now in progress attempting to find more effective and less toxic histamine antag onists. Neoantergan which has just recently been introduced in this country seems to be a drug worth watching Halpern and associates have just reported two other compounds (Fig 2) which are five to ten times as potent as neoantergan and not as toxic. \* Eventually a substance long sought by investigators in the field of allergy and anaphylaxis which prevents all types of allergic reaction no matter what the allergen or the manifestation may be discovered

## Summary and Conclusion

- Pyribenzamine has been used since November, 1944, in 800 patients with various allergic disorders (Table 10)
- Pyribenzamine relieved 78 5 per cent of 461 patients with allergic rhimits of all types.
- Pyribenzamine relieved 47 per cent of 159 patients with bronchial asthma.
- Pyribenzamine relieved 78 per cent of 199 patients with urticaria.
- No serious side-effects have been noted in any patients Many patients have received this drug daily for over two years with no effects on the blood morphology, blood chemistry, urine liver, or kidney function tests
- 6 From our own experience and the information reported in the literature, it appears that pyribenzamine is more effective and less toxic than benndryl.
- Antihistaminic drugs are palliative, and if permanent relief is to be obtained, the etiologic factors of allergic manifestations must still be determined and climinated

# PUBLIC HEALTH ASPECTS OF THE TREATMENT OF TINEA CAPITIS

Louis Schwartz, MD, Washington, DC \*

(From the Office of Dermatology, Industrial Hygiene Division, Bureau of State Services, U S Public Health Service)

THERE is an epidemic of tinea capitis in the United States—It was first brought to the attention of the US—Public Health Service about four years ago by reports from New York, Philadelphia, and Pittsburgh, but it has now spread to practically all parts of the country

Tinea capitis may be caused by various types of fung, such as trichophyton gypseum, microsporon felineum, microsporon fulvum, micro-The present epidemic is sporon audoum, etc due mainly to microsporon audoum disease usually affects children and usually disappears spontaneously after puberty, due to the increase of pelargonic acid in secretions of skin after puberty When the fungi from animal sources cause the disease in humans, there is present on the scalp a marked inflammatory response, which usually results in a cure, but when the cause is the microsporon audouini there is but little, if any, inflammatory response and the disease persists

The city of Hagerstown, Maryland, in 1944 requested the assistance of the Public Health Service in controlling an epidemic which was present there. Hagerstown has a population of about 40,000. There were about 7,000 children in the grade schools and examination of them with the Wood's light revealed about 600 cases of tinea capitis. Microscopic and cultural examinations showed that 98 per cent of the cases were caused by microsporon audouin

Careful examinations and investigations showed that barber shops were the principal sources for spreading the infection and that the electric clippers were mostly responsible Proofs of this were the finding of infected hairs in the clippers, the fact that there were six times as many boys infected as girls, that all the boys had infection in the clipper areas of the scalp. that 65 per cent of the affected boys had the infection only in the clipper areas and that most of the girls were affected only in the hair parts Other lesser sources of infection were found to be common combs and brushes in the homes, the custom of exchanging caps in the schools, and the plush and mohair backs of motion picture seats

The manufacture of electric clippers was stopped during the war This created a shortage so that in some shops one pair of chippers served This did not permit the thorseveral barbers ough cleaning and sterilization of the clippers after each use Besides, the methods of sterilization found in the barbér shops were inadequate to kill fungi In order to remedy these conditions experimental work was done on killing fungi in It was found that immersing the the clippers clippers in mineral oil having a boiling point of 200 C, kept at a constant temperature of 100 C would sterlize them in one minute result could be obtained by immersing the clippers in 2 per cent of boiling lysol for three minutes or in 10 per cent cold lysol for fifteen minutes

As a result of meetings with the city governing authorities, the school authorities, state and city health officials, parent-teacher associations, barbers' associations, and local medical societies, it was decided that the control of the epidemic be placed in charge of the Public Health Service which detailed two full-time dermatologists to Hagerstown for this purpose

Since the disease is spread by means of transference of infected hairs, it was agreed that exclusion of children from school was of little value if they could mingle outside of school Moreover, the schools were the most convenient places for establishing treatment centers, because the children were there five days a week and lost but little time from classes while being treated Infected children of preschool age also could be brought more conveniently by the mother to the local school for treatment. Therefore, it was decided to permit infected children to go to school and be treated there

The barbers agreed not to cut the hair of infected children, but to send them to the treatment centers where the hair was closely clipped every ten days and where medicaments were applied by trained personnel every school day

The doctors agreed to send all infected cases to the treatment centers. The parents were instructed to shampoo the heads of infected children in the morning before coming to school, to supply the infected children with individual combs, brushes, and towels and with clean, closefitting caps which were to be boiled daily. They were also instructed that the heads of non-

<sup>\*</sup>Presented by invitation at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo, May 7 1947, Section on Public Health, Hygiene and Sanitation

infected children were to be shampooed im mediately after receiving a hair cut in the barber shops. These measures served to control the spread of the disease so that upon subsequent re-examination of the schools six months after the first examination only 26 new cases were found, and one year after only 12 new cases were found. Half of these cases had not been examined before, because they had been of preschool age or had moved in from other localities.

It is agreed that the most efficient method of treating cases of tinea capitis is to epilate the scalp, following this with the application of fungicides. Epilation serves to empty the follicles of infected hairs, thus more easily per mitting the entrance of fungicides to kill the fungi remaining in the follicles. Epilation without subsequent treatment by topical application of fungicides usually results in the infection of the new hairs. A rays in epilation doses do not kill the fungi. Epilation may be done manually by pulling out the infected hairs, by exposure to x rays as originated by Sabouraud, and by the oral administration of one dose of thallium acetate, 7 mg. per kilo of body weight.

Manual epilation was used exclusively by dermatologists previous to 1910 and is attended with no danger but is tedious \tag any epilation requires special skill in order to give just sufficient dosage to obtain epilation and yet not to so severely injure the papillace as to prevent regrowth of the hair Epilation by the oral administration of thallium acetate is deemed dangerous by American dermatologists although it is being used in some other countries with no reported serious untoward results

Epilation by either x ray or thallium acetate permits the falling infected hairs to disseminate the infection, whereas when manual epilation is done the hairs can be burned

Dermatologists or radiologists expert in the use of x rays for epilation were not available in Hagerstown, as is the case in many other similar communities therefore we decided to dosely clip the hair of infected children every ten days at the treatment centers, burn the hairs and rely on topical applications for the treatment of the disease. Manual epilation of infected hairs was to be done on suitable areas of the scalp where only a few hairs were infected. In order to aid in the prevention of the spread of the infection all the infected children were required to wear caps at all times.

It was decided to evaluate the curative powers of the many well known remedies used for the treatment of tines capitis. Some cures were obtained by the systematic application of all the remedies tried, but some remedies proved more effective than others by ouring a larger percentage of the cases to which they were applied in a shorter time. However, many cases failed to respond to these remedies or improved up to a certain degree and then remained stationary and in a few cases began to spread again

During the war, at the request of the U.S. Quartermaster we tested for possible skin ir retant properties many chemicals commercially used as antimildows in order to determine their fitness for use on fabrics to be used in the tropics by our armed forces. Most of these chemicals were powerful fungicides but most of them were primary skin irritants and sansatzers.

We selected for trial on the stubborn cases of tinea capitis a few of the antimildens which we thought might be of value in curing these cases and yet would not be too irritating for use in the necessary fungicidal concentrations chlorophenols phonyl phonols phonyl mercurio salts, cationic detergents and salicylanilide were the antimildews we tried Because one of the popular proprietary remedies for tines. pedia, containing sine undecylenate had been used by us with rather indifferent success in the treatment of times capitle, we though that per haps if we substituted copper for zinc, copper undecylenate might give better results because copper steelf is a well known fungicide copper undecylenate was not on the market we made it in our laboratory

All of the chemicals were tried on at least 25 cases and the results showed that 5 per cent salteylanilide in Carbowax 1500 to which was added a cationic detergent Hyamine 1622, and a saturated solution of copper undecylenate in Carbowax 1500 gave the best results. These two remedies were the only ones used toward the end of our experiment and all the remaining cases were cured with them.

Pentachlorphenol 1 per cent in Carbowax, was third in the list of efficacy It will be noted that Carbowax was the cintment base we used in these three preparations and we feel that the physical properties of Carbowax as a surface activating agent played no small role in the curative properties of our remedies. Such a base enables the fungicide to enter the hair follicles and attack the fung more easily than if ordinary ountment base were used.

While these two fungicides gave the best results of the 17 that we tried they are not muracle drugs. In order to obtain good results they must be massaged regularly into the closely clipped scalp at least once a day for at least forty treatment days before the fluorescent hairs begin to disappear. If cures result sooner and sometimes they do so much the better, but some cases may require 100 or more treatments to get well and sometimes in cases where improvement

ceases it is necessary to alternate the two fungicides

If the parents wished to apply the medicaments at home, in addition to the applications in the treatment centers, we had no objections and sometimes cures were thus attained more rapidly. But we learned early not to depend on treatments at home

In addition to the application of the fungicides we also did manual epilation of the affected hairs when they occurred in small isolated patches

A newspaper campaign to educate the public on the hygienic measures to be used by them to help control the epidemic and to inform them of the progress being made was continued throughout the epidemic Circulars to the same effect were printed and given to the pupils to take home to their parents

These measures were so successful that in November, 1946, when we made our last visit to Hagerstown all the cases that were treated by us were cured. There remained only 13 cases of tinea capitas in the city, all having consistently refused to be treated at the centers.

# USPHS Method for the Control of Epidemic of Tinea Capitis

- 1 Meeting with city council, mayor, board of trade, and local newspaper representatives to provide money and publicity for the control of the epidemic
- 2 Meeting with superintendent of schools to obtain cooperation by establishing treatment centers in the schools and permitting infected children to wear caps in the classrooms
- 3 Meeting with the Parent-Teacher Association to obtain their cooperation (a) to permit the clipping of the hair of infected children in schools every ten days, (b) to provide caps for infected children and to sterlize them daily, (c) to shampoo the heads of infected children every morning before coming to school, (d) to provide individual combs, brushes, towels, and beds for infected children, (e) to instruct their children not to change caps, not to rest heads on the backs of movie seats, (f) to shampoo the heads of non-infected children immediately upon return from barber shop, (g) for teachers to see that infected children wear caps in the classrooms
- 4 Meeting with the local medical society to cooperate by sending all infected children to the treatment centers
- 5 Meeting with the Barbers Association to cooperate by refusing to cut the hair of infected children and sending them to the treatment centers, to sterilize all implements after using them to cut the hair of noninfected children

- 6 Meeting with the owners of the motion picture theaters to obtain their cooperation, by examining the plush and mohair backs of seats for fluorescent hairs with the Wood's light after the last performance every night and burning any that are found
- 7 Examination of the heads of all grade school children below the high school with the Wood's light and listing all the infected children
- 8 Establishing treatment centers in the schools
- 9 Supervision of the treatment placed in the hands of a dermatologist and equipping a laboratory with the necessary facilities for culturing and examination of functions.
- 10 The dermatologist shall train nurses or others to clip the hair of infected children every ten days, to burn the clipped-off hair, to do manual epilation, to apply properly the medication under a Wood's light, to keep adequate records
- If competent radiologists or dermatologists are available, \-ray epilation can be done on all who are willing and able to pay for the service
- 12 Epilated cases to be treated daily at the treatment centers until cured
- 13 All children under treatment to wear caps all the time in school, at play, at movies, etc
- 14 Caps to be sterilized daily at home, and the infected children given a shampoo every morning before coming to school
- 15 Criteria for cure When there are no more fluorescent hairs, cultures of hair roots should be made on Sabouraud's medium from areas that were infected. If no growth results the case is considered tentatively cured and treatment is discontinued. The patient is to return after one month and be examined with Wood's light. If there are no fluorescent hairs, the case is cured.
- 16 The preschool age contacts of all cases should be brought to the treatment centers and examined with the Wood's light Infected preschool children should be treated in the same manner as school children
- 17 Periodic inspections should be made of the barber shops to see that tools are properly sterilized
- 18 Periodic inspections should be made of "movie" theatres to see that the backs of seats are vacuum cleaned every night
- 19 Reexaminations of all school children should be made with the Wood's light every three months to discover new cases \*

The topical applications found by the Public Health Service to give the best results in Hagerstown study were

- 1 Salicylamlide 5 Hyamine 1622 (25 per cent) 5
- Carbowax (1500) 100
  2 Saturated solution of copper undecylenate
  m Carbowax 1500
- 3 Pentachlorphenol 1 Carboway (1500) 100

These fungicides have also been used with success in suitable solvents, such as alcohol ether and some of the volatile hydrocarbon solvents in which they are soluble, such as trichlorethylene.

\* These method have been used successfully to control the epid mics of ringworm of th scalp in Eikhart Indiana Takoma P rk, Maryland and Alamanee County North Carolina

#### DR BAYNEJONTS APPOINTED

Dr Stanhope Bayne-Jones appointment to the newly created position of president of the Joint Administrative Board at the New York Hospital-Cornell Medical Center effective July 1 was announced recently by Dr Edmund Eara Day president of Cornell and William Harding Jackson president of the New York Hospital. These institutions share in maintaining and operating the medical center at 68th Street and the East River

In making the announcement, Dr Day and 'In his new position, Dr Bayne-Joues becomes the chief executive of the Joint Board, made up of representatives of Now York Hospital and of Cornell University As such he will be responsible for the

formulation of policies and an over-all program for the Center President Day said that the position has been created in order to implement the Center's full potentialities for public sorvice. Both Dr. Day and Mr Jackson expressed confidence that in Dr. Bayno-Jones they had obtained 'the outstanding man for one of the most important positions in the medical world

Dr Bayne-Jones was formerly dean of Vale University School of Medicine and is currently serving as director of the Board of Scientific Advisers of the Jane Coffin Childs Memorial Fund for Medical Research and as professor of bacterology at Vale

Vew 1 ork Medicine June 20 1947

#### NATION WIDE SCIENTIFIC ATTACK LAUNCHED ON PROBLEM DRINKING

Announcement has been made of the first largescale action-wide attack on problem drinking by the Research Council on Problems of Alcohol, an associated society of the American Association for the Advancement of Science.

Organized ten years ago the Research Council has been working quietly and energetically in sponsoring individual research projects among leading scientific institutions to get at the fundamental causes of problem drinking, which affects the lives of over 750,000 people in the United States. The primary objective of the Council is to learn more about those

fundamental causes and to develop effective methods

of treatment and prevention.

The Research Council hopes to establish a series of research diagnostic treatment centers in leading medical schools and their affiliated hospitals throughout the country. One of the first of these has already been established at the Cornell University Medical College—The New York Hospital, under a grant of \$150,000 covering a five-year period. A chain of such centers, the Research Council feels, will provide many of the answers and much of the services needed to cope with this much neglected medical problem.

#### MEDICAL LICENSES REVOKED AND SUSPENDED

The Board of Medical Examiners of the State Education Department has announced the following revocations and suspensions to practice medicine in the State of New York.

Ibrahim J Abdallah, 7820 Ridge Boulevard, Brooklyn. License revoked, effective May 29 1947
 Simon Bloom, 113 East Second Street, New York

City License revoked effective May 28, 1947

D Garciano Perez, 156-08 Riverside Drive, New York City License revoked effective May 2, 1947

Hugo I Franceso, 635 East 211th Street, New York City License revoked, effective May 7 1947

Nicholas E. Caputo 120 Franklin Avenue Brooklyn License revoked, effective May 7 1947

Nicholas A. Tonia, 355 West 51at Street, New York City License revoked effective May 7 1947

Hirsch L. Messman 57 West 57th Street, New York City License suspended for a period of one year beginning May 20 1047

# NUTRITION AND CHILD HEALTH

RALPH R Scober, MD, Syracuse, New York

HE status of childhood indicates not only L emergence from infancy but also a milestone in the direction of the manhood and womanhood of the future citizens of the state toward maturity is basically dependent on the preceding nutrients supplied during each The newborn infant, stage in development for example, is the product of food elements furnished to the fertilized ovum by the mother It is obvious, therefore, that the structure of the infant may be optimal if these nutrients are supplied quantitatively and qualitatively in adequate amounts during fetal life Conversely, one would expect that quantitative and qualitative deficiencies of nutrients supplied to the fetus might result in structural and physiologic deviations from normal

In appraising the present health of a child, therefore, it is often desirable to obtain a history of what has transpired in its life, not only from birth, but also during fetal life. The preconceptional health and nutrition of the mother and her health and nutrition during the prenatal state often give valuable information regarding the health of the child during the formative or fetal stage of development One can, thus, often appraise the present status of an infant or child by carefully analyzing his or her nutrition status during each stage of development It is well known that certain nutrition deficiencies have effects on the individual lasting throughout It is possible, therefore, that many abnormal conditions that are observed throughout childhood had their beginning during fetal life and were primarily the result of poor nutrition of the mother

It has been shown by a number of investigators that a poor diet during pregnancy is not only detrimental to the mother, but also has harmful effects on the infant. Ebbs and associates found that during the first two weeks of life the condition and progress of the offspring of mothers who were poorly nourished was poor or bad in 14 per cent of their cases, as compared to none who came from mothers who were well nourished. It was noted that during the first six months of life there was a definite increase in the incidence of bronchitis, pneumonia, anemia, and feeding difficulties among the babies of poorly nourished mothers as compared with those of well-fed

Presented at the Public Hearing of the New York State Joint Legislative Committee on Nutrition, New York City December 11, 1946 mothers Tetany and rickets were not noted in the offspring of well-nourished mothers but were present in those of the poorly nourished mothers

Burke and associates found that 67 per cent of the infants born to mothers whose general dietary ratings were "poor to very poor" were stillborn, died within three days of birth, had congenital defects, were premature or "func-tionally immature" Twenty-eight per cent were considered in "fair" or "poor" condition, and only five per cent were in "good" or "excellent" condition Actually, all but one infant, in the senes of 216 cases, born to mothers with "good" or "excellent" diets during pregnancy, were in "good" condition at birth, while only two infants born to mothers with "poor" to "very poor" diets during pregnancy were in "good" condition at Although the "fair" to "very poor" diets in the foregoing studies were found to be deficient in several essential nutrients, they were generally found to be consistently low in protein

It must be admitted that an adequate, well-balanced diet is desirable for growth, development, and adequate functioning of the body. We cannot overlook the fact that the basic foundation of the diet, as of the body, must consist of protein. As its Greek root implies, protein is of first importance.

Protein not only is the most important constituent of the protoplasm of the body, but it is necessary for the formation of all living cells. It is required for the synthesis of body protein, plasma protein, hemoglobin, hormones, and enzymes, as well as the formation of secretions, such as milk. Adequate protein intake is necessary to form enzyme systems from vitamins. Protein is concerned with immunity, antibody formation, osmotic pressure, colloidal action, and specific dynamic action. It is capable of supplying energy to the body and participating in the detoxication of evogenous and endogenous toxins.

Protein, especially animal protein, is the most expensive food substance and during inflations and depressions protein of animal origin is unobtainable in significant amounts by all people because of diminished purchasing power. In time of war, it is not only expensive but scarce. Under such conditions protein deficiency states are probably more prevalent than is generally realized.

When protein is deficient in the diet, one would expect to find disturbances of many physiologic

processes in the body and the possible development of pathologic states It appears, moreover, that there may be not only a protein deficiency per se but secondary effects resulting from the inability of the body to utilize properly vitamins and minerals, and also interference with the normal function of the endocrine glands. The thyroid gland, in particular, is affected apparently adversely by a deficiency of protein, since a state of hypometabolism is often present. Diminution in size and secretory activity of the thyroid gland was particularly emphasized by those who studied nutritional edema in Europe in 1918 3 Some of the symptoms and signs of protein deficiency are strikingly similar to those observed in hypothyroidism, viz. low basal metabolic rate, hypotension, hypothermia, etc.

Inter relationships between the thyroid gland and other glands of internal secretion, and vitamin metabolism have been shown to exist appears, also, to be a parallelism of the symptoms noted in dietary deficiency states with the symptoms produced by an imbalance of the sympathetic nervous system It does not appear to be a coincidence that many of the symptoms of protein and vitamin deficiency, thyroid dysfunction, and sympathetic nervous system im balance are similar but rather it seems that an inter-relationship does exist. This inter-relationship with protein apparently playing a basically significant role, appears to be a factor in producing a symptom complex which has been observed in private practice and among school children.

#### Clinical Observations

Although the writer has advocated breast feeding for many years, he has found it in creasingly difficult for mothers to nurse their babies at the breast despite the fact that they are willing and anxious to do so. Inquiry has usually revealed that many of these mothers have subsisted on an inadequate protein intake during and after their pregnancies. Although they are supplied with additional quantities of vitamins calcum and iron during pregnancy, some of these mothers show signs of vitamin deficiency and anemia.

The offspring of many of these deficient mothers are small at birth at times premature. They often thrive poorly during infancy. Some of the infants gain rapidly in weight and become excessively large for their age. Umbilical hernia and undeveloped genitalia are commonly observed. Retarded dentition and signs of rickets are often noted. Respiratory infections are common. Many babies sleep poorly, are colicky or irritable.

Among those beyond the age of infancy a

symptom complex has frequently been observed in cases that give a history of a deficient protein intake. These children fail to respond significantly to supplementary vitamins although signs of vitamin deficiency are often present. However when the protein deficiency is corrected the response to vitamin preparations is more evident.

Although some of the children are underweight there are many who are of normal weight or over weight, according to accepted standards, but who manifest similar signs of deficiency Frequent and prolonged infections involving the akin, mouth, or respiratory tract have been noted in many of the children who have been mentioned

A mother will occasionally point out that her child falls easily, or that he appears to be clumsy One such case led the writer to suspect a brain tumor, but the child's symptoms responded to dictary supplementation. There is, at times, a history of injuries from relatively minor causes and often there is delayed healing in these cases.

The nervous system of many of the children patients apparently has been affected definitely by a diet that is found to be deficient in protein Many of the children are irritable and restless Biting the finger nails is frequently observed Some of these patients "go to pieces if the mother or teacher corrects them Many times the complaint is that the child will not sit still There are children who will not readily go to sleep, and others who wake up frightened, some are restless in their sleep.

There are complaints of fainting or dixmess. Some of the children tire easily or lack ambition others are retarded in their school work. Some complain of frequent headaches. Abdominal pain and constipation are often noted, and at times there are digestive disturbances. A number of children have vague pains in the extremities which often give the confusing picture of rheumatic fever. In some cases there is precordial pain

It has been observed quite often that receiving diets which are found to be deficient in protein have frequency of urination. Some have nocturia or enuresis. Vaginitis is commonly observed in girls.

The physical examination of many of these children often reveals the presence of puffiness of the eyes.\* In some cases there are dark circles beneath the eyes. The skin often shows a definite pallor less frequently, there is a pale, lemon color present. The postures are often

The puffiness of the eyes refers to a nonpitting awelling of the syslids and cyabrows, as well as the skin lateral to the re including that over the malar bone

poor and the muscles are flabby Some of the children have rough skins and coarse hair, others have lesions on the feet resembling burns or endermophytosis

The teeth of many of the children are found to be carrous, and it is noted in some cases that recent dental work has been done. A yellowish discoloration is frequently noted on the teeth of many children, including those who apparently have sound teeth.

The tonsils in many cases are found to be hypertrophied or diseased, however, in some instances it is noted that the tonsils are out, which would indicate that they probably had been hypertrophied or diseased

Tachycardia or bradycardia is not infrequently present, and a low blood pressure is often observed. In some cases the temperature is subnormal

Many of the children show evidence of having bitten their finger nails. Many of them have leukonychia (white spots) on the finger nails, this condition is frequently noted in states of thyroid dysfunction <sup>4 6</sup>

### Malnutrition in School Children

During the school year 1945 to 1946 it was noted, during routine examinations, that many of the children frequently showed signs similar to those that had been observed in private In order to correlate the puffiness of practice the eyes and the leukonychia on the finger nails with the physical defects that were observed. these findings were recorded on each chart the end of the school year, it was noted that of the 1.789 children who had been examined in four schools, 1,357, or 758 per cent, showed physical defects Three of these schools included many children in the lower economic group, the fourth school included children of a higher economic status The total number of children with physical defects who showed puffiness of the eyes was 514, and the number who showed puffiness of the eves and leukonychia Those children who had physical was 481 defects with leukonychia alone amounted to 144. and those showing neither puffiness of the eyes nor leukonychia amounted to 218 Thus, the children with puffiness of the eyes and those showing puffiness of the eyes and leukonychia ran almost parallel (Table 1) Although many of the children without physical defects showed puffiness of the eyes alone or with leukonychia, or leukonychia alone, yet the percentage was only 55 per cent as compared with 82 per cent in those children with similar signs who had physical defects Studies are being conducted now to determine during the school year how many of those with puffiness of the eyes, with or without

TABLE 1 —SUMMARY OF PHYSICAL EXAMINATIONS OF THE CHILDREN IN FOUR SCHOOLS SHOWING THE INCIDENCE OF PUFFINESS OF THE EYFS AND LEUKONYCHIA

Total Examined	1789
Total with Defects	1357
Puffiness of the eyes	514
Leukonychia	144
Both	481
Without either	218
Total without Defects	432
Puffiness of the eyes	70
Leukonychin	50
Both	121
Without either	191

leukonychia, and leukonychia alone, who had no physical defects last year will show evidence of defects this year

When the figures that have been mentioned above are examined in detail and compared with the individual defects, it is found that the number of children with defective hearing, vision, tonsils, teeth, heart, nutrition, posture, and skin are approximately the same in the group with puffiness of the eyes alone as in the group with puffiness of the eyes and leukonychia. Thus, there is a parallelism in the numbers showing similar physical defects in the group with puffiness of the eyes and the group with puffiness of the eyes and leukonychia (Table 2)

TABLE 2—Comparison of Physical Defects with Associated Puppiness of the Eyes and Leunonichia

Defective hearing Defective vision Tonsils Heart Nutrition	Leuko- nychia and Puffiness 13 30 100 25	Leuko nychia 3 10 22 3	Puffiness 9 26 102 16	Neither 4 18 42 7

# Nutrition Studies in Ringworm Infection

At the beginning of the school year 1945 to 1946, it was noted that children with ringworm infection of the scalp frequently showed puffiness of the eyes and often leukonychia, together with a high incidence of physical defects. Since many of these children appeared to be undernounshed and the widespread epidemic of ringworm infection throughout the United States seemed to run parallel with the rationing and shortages of food, it was decided to conduct an investigation with these facts in mind Although ringworm infection has affected a relatively small proportion of the school children in Syracuse, it has been a difficult disease to eradicate It often requires up to two years or more to combat it in the individual child with the methods of local therapy usually employed

With the corroboration of Dr Anne Bourquin, professor of nutrition, Syracuse University, and

her assistant, Emilia D Mainello, nutrition studies were made on four children with rangworm infection of the scalp A four-day dietary study was made on each chuld This investigation of the diet revealed that each of these children had dietary deficiencies of soveral food elements including protein as compared with the recommendations of the National Research Council All local therapy was discontinued in each of these cases and protein hydrolysate was given nt school and in supplements at home

The diagnosis of the ringworm infection was made and the progress of the disease was followed by the Wood filtered ultraviolet lamp Within ten days, two of these children showed marked in provement in the ringworm infection. One child showed unsatisfactory results and local therapy was resumed, the fourth child was afflicted with rheumatic fever after the start of the study and was absent for the remainder of the school

We were encouraged with these results and, therefore, began more intensive studies on a larger number of children with ringworm in fection Sexteen children were selected for these studies and they were divided into four groups. The ringworm of the scalp which was identified as the Microsporon audoumi infection, had persisted for over a year in spite of local therapy in all but two of these children A week's dietary study of the sixteen children revealed deficiencies of reveral nutrients in the diets, including protein as compared with the recommendations of the National Research Council The calone value of the diets was as great as 30 to 40 per cent deficient in several instances Nitrogen balance studies, conducted on four of the children prior to supplementing the diets, showed all of these to be in negative nitrogen balance

All of the children studied had puffiness of the eyes and poor postures. All but four had a yellowish discoloration of the teeth, and all but finger nail biters. Leukonychia was present on the finger nails of eleven of the children skin of four children had a pale-lamon yellow color five had coarse hair seven had dark circles beneath the eyes four were ten per cent or more underweight two had hypertrophied tonsils, and two had heart murmurs

One group of these children was given protein hydrolysate and a liver-stomach concentrate sodium iodide, 10 mg per week, was given to a second group in addition to the customary diet. The iodine was employed to determine whether or not the beneficial effects of local iodine therapy might be dependent to some degree upon absorption and systemic action Protein hydrolysate was prescribed for the third group fourth group was given a balanced diet fortified

with supplementary vitamins to correct the dietary deficiencies indicated by the dietary studies

The most rapid and greatest amount of im provement in the ringworm infection was noted in the groups receiving protein hydrolysate One child in the group receiving rodine internally made outstanding improvement. The results in the group receiving a diet balanced with natural proteins and supplementary vitamins were not as rapid nor as obvious as those receiving protein hydrolysate We attributed this result to the fact that the protein deficiency had probably produced a disturbance in digestion and assimila tion and that protein in a form such as protein hydrolysate, which requires little or no digestive preparation resulted in a more evident response than natural protein The observation that the administration of internal loding was effective in the treatment of one of our cases might imply that there was an iodine deficiency present

Experiments conducted this school year on a small series of cases also appear to indicate that an rodine deficiency may be present in some cases of ringworm infection The application of rodine to the area of the scalp affected by ringworm was discontinued in five cases and applications were made on other parts of the body. The results in these children were comparable to those observed when rodine was applied directly to the area of the scalp involved by the ringworm.

Our studies, though limited in extent, would appear to indicate that the nutrition status of a child influences the susceptibility and rate of healing in ringworm infection. It might therefore, be assumed that the nutrition status of the child is playing an important role in the increased incidence of the ringworm infection which has been noted throughout the United States since the onset of World War II

#### Conclusions

The need for scientific nutritional studies as well as a nutrition program to compensate for the undequacies in the home dietary and thereby. provide a completely adequate diet for the school child, is clearly indicated. When we reshire the need for wider acceptance of these requisites we will have healthier children as well as children who are mentally equipped to face the future with greater security

1411 SOUTH SALINA STREET

# DIETHYLSTILBESTROL AS AN AID IN THE TREATMENT OF PSORIASIS

LAWRENCE FRANK, M D, Brooklyn, New York

THEORIES as to the cause of psonasis are numerous and, as in any disease of unknown etiology, the treatment is varied and not very satisfactory. Out of the maze of clinical and laboratory findings there is much to indicate a relationship between the endocrine system and psonasis.

The value of sunlight in psoriasis has long been known, and the fact that the disease is rare in the Negro suggests a relationship between melanin on one hand, and the adrenals or gonads on the other

Reynolds1 states that "if hypogonadal individuals (man or woman) are exposed to sunlight they fail to tan readily although an invisible change takes place in the tissues androgens or estrogens are miected subsequent to exposure to ultraviolet light, pigmentation of the skin occurs without further exposure to light Injections of the hormones into nonphotosensitized individuals fail to elicit pigmentation The relation of this phenomenon to the mechanism of carotin and melanin is unknown suggestive that sex hormones have a sterol nucleus somewhat similar to that of adrenal cortical hormone in the absence of which coloration of the skin characteristic of Addison's disease takes place"

Fat metabolism has long been believed to play a role in psoriasis, although the findings of a hypercholesteremia have been contradictory:

Gruneberg<sup>3</sup> and others believe the adrenal plays an important role in psoriasis. LeWinn and Urbach<sup>4</sup> in a recent article sum up the evidence in the following manner Definite decreases in urinary vitamin C excretion, the decrease in the amount of sulfur excreted in the urine, and the increase in the blood potassium level all found in psoriasis, infer a relationship between this disease and the adrenal cortex

Unfortunately, the therapeutic application of this relationship has produced no uniformly successful result, and treatment is still mainly directed at the local condition of the skin rather than by the use of any systemic therapy

Madden<sup>5</sup> treated 6 patients with 1 cc of adrenal cortex hormone twice a week. His results showed no improvement in 5 cases and improvement in one case. LeWinn and Urbach<sup>4</sup> treated 18 patients with ascorbic acid, adrenal cortex extract, and a low potassium diet, and could not observe any definite benefit from this type of therapy

The use of female sex hormones has been tried with both encouraging and discouraging results.

The problem remains that there is still much to indicate a hormonal relationship, but what this relationship is, or which glands are involved, is still a matter of conjecture. The thyroid, the pituitary, and the pancreas have all been considered at some time, but no new light his been shed on the subject.

It is obvious from a perusal of the literature that the exact mechanism of the endocrines is far from a solved problem. Nor is it clear of the many component substances these glands secret. Could a deficiency of some of the unisolated hormones or a defect in their synergistic action be at fault?

With this in mind, an attempt was made in a series of cases to stimulate the adrenal gland indirectly through the action of diethylstil bestrol on the pituitary gland It has been shown that the administration of diethylstil bestrol results in an increase in the weights of the pituitary and adrenal glands in both male and female animals 10 Von Haem 10 also noted that the increase in both these glands was much greater in animals treated with stilbestrol than those treated with equal doses of estrone, and that the adrenals became brownish-red in color and the pituitary appeared more hyperemic. The Smiths 11 state that stilbestrol appears to be about one hundred times as active as estrone in eliciting the pituitary responses of intact animals, although only about twice as active in castrated The pituitary effect obtainable in the animals presence of testes indicated that its metabolism was not regulated by the same mechanisms as The authors the naturally occurring estrogens noted that probably stilbestrol's effect on the pituitary gland is direct rather than through the formation of some metabolic inactivation product as appears to be the case with estrone.

In addition to a stimulating effect of diethyl-stilbestrol on the adrenal gland, it has been shown that sex hormones and suprarenal cortical extracts have a close structural relationship, and have a similar effect on the excretion of electrolytes 13. The administration of both results in a decrease in the renal excretion of sodium and chloride and an increase in potassium excretion.

# Material for Present Study

Twenty patients with unquestionable psoriasis

were treated with diethylatilbestrol The treatments were carned out from March through Due to the small number of cases avail able and the difficulty of holding the patients for a sufficient trial period, adjuvant local therapy was used at first. It was found later that the most successful therapy was a combination of the two There were eight men and twelve women included in the senes, and their age groups ranged from nineteen to forty-seven years of age The daily dosage of diethyl stilbestrol was 2 mg, except in those women who still menstruated on this dose women were given 4 to 5 mg daily as it was felt that inhibition of monstruction was a good guide to adequate therapy

#### Clinical Study

Five patients whose enset of psoriasis was of very recent date (from one week to two months) were treated with diethylstillectrol by mouth and 1 2-3 contment\* to the right half of the body only. After one month improvement was noted on both sides of the body, but the improvement in the area where the cintment had been used was so marked that it was then decided to use the cintment on both areas. The scalp, when involved was treated with equal parts of lanclin petrolatum, and oil or not at all. Complete clearance of all lesions was obtained in all 5 cases. The time interval required ranged from five to ten weeks.

Two patients were treated with diethylstil bestrol by mouth and none locally Both were chronic psoriatics and had had much local therapy and ultraviolet light previously with indifferent results. One of these patients showed a moderate improvement after five weeks on this therapy. The other remained stationary Ultraviolet in weekly suberythema doses was then added to the therapy and both showed marked improvement. The lessons completely disappeared in one patient after a total of eight weeks' treatment.

Three cases of chronic psoriasus were treated with diethylstilbestrol by mouth generalized ultraviolet radiations and 1 2-3 ointment applied locally Improvement was noted in two cases No change was noted in the third case.

Seven patients, all chronic cases of psonasis were treated with diethylstillsestrol by mouth and 12-3 outment locally to half of the body. When slow improvement was noted a stronger ointment of ammonated mercury and sallcylic acid, both 3 per cent in a sine oude ointment base, was used on the half of the body previously untreated. Improvement was more rapid in

five of these cases. Two cases showed little change.

Two cases both of whom had had their lesions for many years and had received much previous local treatment and ultraviolet light, were treated with diethylstilbestrol by mouth and an ointment of oil of cade and chrysarobin locally, combined with ultraviolet light. Both cases improved rapidly and in six weeks were completely free of all lesions.

Treatment of one patient was discontinued in the third week due to severe edema of the ankles which occurred while on diethylstillestrol ther apy. This was the only reaction severe enough to necessitate stopping the drug. Another patient stopped the drug for four days due to severe nausea, then felt that her improvement had been so great that she would try to tolerate the nausea. No nausea was experienced on retaking the drug. Four other patients complained of nausea which either disappeared or remained mild enough to continue with medication. Painful breasts and a fullness of the breasts were complained of by four men and three men stated that they had lost their sex desire.

#### Summary

Of twenty cases of psomasis treated with diethylstilbestrol as an adjuvant to local therapy, eight cases were completely cleared of all lesions. Five of these eight cases were very early cases of psomasis, treated within two to eight weeks of the development of their original lesions.

Ten cases showed from moderate to marked improvement over a period of six to ten weeks Most of these ten cases had been receiving the same type of local therapy for long periods of time prior to the addition of diethylstilbestrol to their therapy

Three cases of psoriass showed no improvement Treatment was discontinued in one patient due to toxic reaction from therapy

Of the eight cases cleared of leaons one case has relapsed within two months. Whether therapy was stopped too early to prevent regression, or if improvement is present only when diethylstilbestrol is being taken is undetermined thus far. Further work will have to be done to determine this

Of the eight cases completely cleared of all lesions, five were women and three were men of the improved cases, five were women and three were men of the failures one was a woman and two wore men one woman stopped thempy after the third week due to a tone reaction.

In the cases benefited the improvement in the first three weeks of therapy was slow or indifferent. After three weeks, improvement was more apparent and rapid

<sup>9</sup> Liquid aluminum acetate 10 parts; lanolin 20 parts; and sinc pasts 30 parts

### Conclusion

Diethylstalbestrol is a valuable adjuvant to the treatment of psonasis It is believed that its effect is through an indirect stimulation of the adrenal gland

Diethylstilbestrol alone is insufficient therapy. although it seems that sometimes the only other addition required is a bland ointment used locally and regularly upon the skin

Early cases of psomasis before the skin changes, becoming thickened and torpid, are most benefited by therapy

Chronic cases of psoriasis who were previously treated for long periods of time showed an improvement by the addition of diethylstilbestrol to the therapeutic regime

## STATEMENT BY THE ACTING COMMISSIONER OF HEALTH ON LIVE ANIMAL EXPERIMENTATION

Rules governing the care and treatment of living animals used for scientific research by laboratories and institutions in New York State were promulgated by Dr James E Perkins, deputy and acting state commissioner of health, and were filed June 2 with the Secretary of State They will implement an act passed this year by the Legislature, effective July 1, 1947, which requires approval by the State Commissioner of Health before a laboratory or an institution can conduct experiments involving the use of living animals Approval of laboratories under the new law will be granted for a period not to exceed one year In announcing the new rules, Dr Perkins said

"Every decent person, I am sure, will welcome this additional safeguard against unnecessary experiencing of pain by such animals. At the same time, neither the law nor these rules will hamper in any way legitimate scientific studies leading to reduction in misery and suffering of both human beings and No person who understands the tremenanimals dous accomplishments of such research in the past would want it interrupted

"Thousands of persons now leading happy, useful lives have escaped agonizing, prolonged suffering and even premature death solely because of the knowledge and skill learned through research with animals in the past A few of the advances made through such research in combating the ills of mankind are the improved methods of treating diabetes and cancer, and the operations through which 'blue babies' with congenital malformations of the heart are restored to normal lives instead of being condemned to invalidism and early death

"Furthermore, thousands suffering today may at least have the comfort of assurance that their children may escape similar suffering, as the result of scientific studies with the use of living animals which are being carried on at present, or will be conducted in the future

"Animals which are contributing so much to human welfare are entitled, however, to clean, well lighted, adequate quarters maintained at a com-fortable temperature. The great majority of experiments can be conducted painlessly and any pain or discomfort obviously should be avoided whenever possible In the occasional instance in which a procedure must be employed in an important experiment which will result in pain, care should be taken to cause as little discomfort as possible, and the evperiment should be undertaken only with the express permission of the scientifically qualified, responsible individual in immediate charge of the work in the laboratory

The rules which have been promulgated in accordance with the provisions of this new act will further insure that such rights of animals used in scientific studies will be respected "-Health News, June 16, 1947

### ATOM BOARD NAMES 7 MEDICAL ADVISERS

The United States Atomic Energy Commission announced on June 15 appointment of a special medical board of review of seven scientists in medicine and biology who will advise the commission on atomic research in the medical and biological fields

The members of the board are Dr Robert F Loeb, chief of the division of medicine, Presbyterian Hospital, New York City, chairman, Dr Detlev W Bronk, chief radiologist, University Hospital, Phila-delphia, Dr Wallace O Fenn, professor of biology,

University of Rochester Medical School, Rochester, Oliversity of Rochester Medical School, Rochester, New York, Dr Herbert S Gasser, physiologist, Rockefeller Institute for Medical Research, New York City, Dr Ernest W Goodpasture, dean of the School of Medicine, Vanderbilt University, Nashville, Tennessee, Dr Alan Gregg, director for medical sciences, Rockefeller Foundation, New York City, and Dr A Baird Hastings, professor of biochemistry, Harvard Medical School, Cambridge, Massachusetts Massachusetts

#### MENINGOCOCCIC MYOCARDITIS

Samuel Effet MD, FACP Aaron Cohen MD, Thomas J Longo MD FACP, and Wilfred Dorfman, MD, Brooklyn, New York

(From the Medical Service of the Coney Island Hospital)

THE recent literature has been replete with studies of myocarditis occurring during the course of various infectious diseases, such as diphthena, scarlet fever, pertussis, measles 'mumps,' scrub typhus,' influenza,' malarna,' infectious hepatitis,' atypical pneumonia,' and pneumoeoccus pneu monia.' In many of these instances the diagnosis of myocarditis was made only because the investigator was alert as to its possibility

A review of the literature concerning meningococcic myocarditis similarly indicates the need for alertness as to its possibility. Holman and Angevine' state that acute myocarditis is not an uncommon complication of acute systemic infection and cite 2 cases of meningococcic myocarditis. In their first case a fatality the heart did not attract their attention. As a result of this experience, clinical and electrocardiographic investigation of the second case led to the dilagnosis.

Otto Saphir10 reported 240 cases of my ocarditis in a series of 5 626 autopaies two of which were due to the meningococcus. Saphir<sup>11</sup> also found myocarditis due to the meningococcus in 2 cases in a series of 15 of meningocoecus meningitis. In 1939 Hartwell12 reviewed the literature and found 17 instances of meningococcio endocarditis and 12 of meningococcie myocarditis The cardiac lesion found most frequently was an involvement of the endocardium of the mitral valve. Rappaport and Luckerbrod18 reported a case of meningococcemia with meningitis myocarditis, and pulmonary involvement. MacMahon and Burkhardt14 reviewed 12 cases of meningococcic endocarditis, all of which were fatal and observed that most of these were not recognized chnically. The authors believe that endocarditis can be caused by the meningococcus without there being any evidence of meningeal in volvement. Rhoads, 18 similarly reported cases of vegetative endocarditis due to the meningococcus. without clinical evidence of meningitis. Gwyn16 reported a case of subacute meningococcic endo-

bacterial endocarditis.

The usual picture of meningococcic endocarditis is
that of a bacteremia plus valvular involvement.

It may run a subacute course, characterized by joint
pains and eruptions that are maculopapular or
hemorrhagic in character The spleen may be enlarged and there may be abuminuria and hema
turia in According to Swift, it four reactions in the
joints are common symptoms of meningococcic
sepsis.

carditis which followed the classic form of subacute

Scherf and Boyd<sup>10</sup> state that electrocardiographic studies show that every case of endocarditis is accompanied by some myocarditis. Meningococcic abscesses of the myocardium have been reported and quoted by Saphir <sup>11</sup>

Neubauer i in a study of myocarditis in acute infectious diseases found that myocarditis can be present with doubtful or absent chnical signs and symptoms. Pallor, listlessness or vomiting may be the first sign. Albummuria may be present. The first sound at the apex may diminish in intensity or be equal to the second sound. Later it may be in audible. Other symptoms include persistent tachy cardia gallop riptime, cardiac enlargement low blood pressure, and a low diastolic level. Electrocardiographic studies reveal flat. T waves which later become isoolectric and then inverted. The ST segment is below the isoelectric line in leads 1 or 2 or both. The sum of the voltage of T waves in the limb leads is less than 1.5 millivolts.

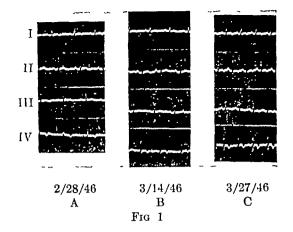

Many postinfectious convalencent cases whose condition is unsatisfactory may be suffering from myocarditis rather than from a vague asthemi low blood pressure or psychoneurous. This has been demonstrated by a recent review of acute non-specific myocarditists occurring during infectious processes.

The following case report seems interesting from several aspects. First, a fortuitous circumstance led to the diagnosis Second marked electrocardiographic changes were revealed that persisted over a long period of time. Third the postmeningitis convalescent care of the patient was modified properly as a result of early diagnosis. Fourth it affords an opportunity to stress the need for alertness as to the possibility of myocarditis in all infectious diseases.

#### Case Report

This patient, V. R., a woman aged 23 artist by occupation was admitted on January 27, 1946 and remained in the hospital until May 5, 1946 She was admitted in a semicoma with a history of the onset of her illness with occipital headache multiple joint peans stiff painful neck and sore throat. A petechial rash had appeared on the body a few hours before admission. The only significant point in her past history was that of a cervical spine injury at the age of 6 which had left her with persistent neck peans and recurrent headaches.

Physical examination on admission revealed con junctival petechlac generalized cutaneous petechlac and eech moest over the trunk. The heart was normal in size, no murmurs were suddiel. Rhythm was regular with a rate of 112 P. was greater than A<sub>1</sub> Movement of the knees, ankles and cllow joints elicited pain. Kernig and Brudsinski signs were positive. The neck was rigid Temperature was 102 6 F. Blood pressure was 107 80. Urinally sis was negative. Spinal fluid on admission was cloud, with 14,300 white blood cells per ce. The differential was 78 per cent polymorphonuclears and 22 per cent lymphocytes. Globulin was 2 plus, gluesse 10 chorides 641 and total protein 216. Smear showed gram-negative intracellular diplococcus, and culture showed neissoria meningitides. The diag

nosis was meningococcic meningitis and meningococcemia. The treatment consisted of 6 Gm of sulfadiazine daily with 12 Gm of sodium bicarbonate orally, following an initial intravenous dose of 4 Gm of sulfadiazine Penicillin was given in doses of

50,000 units every three hours

The temperature fell rapidly and after forty-eight hours reached normal The petechiae faded and the nuchal rigidity was slight Due to a change in services at that time sulfadiazine was inadvertently continued until February 7, with a resultant (?) rise in temperature to 102 F on January 31, which was maintained to 104 F on February 6 On February 6 spinal fluid was crystal clear Study showed 6 lymphocytes, with no polymorphonuclears organisms were found on smear or culture Glucose Kahn and was 70, globulin negative, chlorides 640 colloidal gold tests were negative Following the discontinuance of sulfadiazine, the temperature promptly fell to normal in twenty-four hours Penicillin was discontinued on February 10

The temperature remained flat until February 19, when there was a sudden rise to 103 F. This persisted for seventy-two hours, then fell to normal and remained so until March 24 when it reached 101 to 102 F for forty-eight hours and again subsided to

normal, where it remained until discharge

On February 11 pain in the right ankle with swelling and tenderness was noted. There was no redness nor limitation of motion. Pains in both ankles

continued until April 1

On February 6 the patient complained of lower sternal pain. Chest plate at the bedside revealed slight elevation of the left diaphragm. On February 19 coincident with the onset of the seventy-two-hour temperature rise which was noted above, the patient complained of pain in the left axilla and scapular area aggravated by breathing Examination showed diminished breath sounds in the left chest and an apparent splinting of the left chest. A diagnosis of acute pleuritis was made

With the continuance of the joint pains and the elevated sedimentation rate of 5 mm in five minutes on February 25, an electrocardiographic tracing was advised, although physical examination of the heart remained noncontributory The electrocardiographic tracing on February 28 (Fig 1A) revealed the following PR interval 0.20 seconds, QRS 0.08 seconds, rate 74 per minute, T<sub>1</sub>, T<sub>2</sub>, and T<sub>4</sub> were negative, and of the so-called "coronary contour" ST<sub>2</sub> was 0.5 mm above the isoelectric line Similar electrocardiographic findings were noted on March 14 (Fig 1B) On March 21, all T waves were negative.

tive This was also noted on March 27, (Fig. 1C), April 4, and April 9 On April 21 and on May 11 all

T waves were diphasic

The pains in the ankles continued, and on March 23 knee pains were present On March 26 pains in the neck, shoulder, and interscapular region were noted, with a temperature rise to 101 F The sedimentation rate, which had fallen from 5 mm in five minutes on February 25 to 2 mm in five minutes on March 15, was again 5 mm in five minutes peated blood cultures on February 7 and 18, and March 27 were negative. Blood chemistry and urine examination proved negative On March 29 clinical anemia was noted and corroborated by labo-The hemoglobin was 66 per cent and ratory study the red blood cell count was 34 million mission these values had been 86 per cent and 43 At this time, the possibility million, respectively of subacute bacterial endocarditis was considered

After April 1 the patient had no further complaints. The temperature and sedimentation rates remained normal. On April 19 she was allowed out of bed with graduated activity and was discharged on May 5. The final diagnosis was meningococcemia, meningococcie meningitis, toxic pleuritis, and toxic myocarditis secondary to the systemic

meningococcic infection

Subsequent study of the patient on December 18, 1946, seven months after discharge from the hospital, revealed her to be symptom free — She had returned to her normal activities and had no limitation of cardiac function — Physical examination was entirely negative and electrocardiographic studies including multiple precordial leads revealed entirely normal findings

### Discussion

The case reveals unmistakable evidence of meningococcic meningitis overtreated with sulfa and a resultant drug fever The prolonged arthritic manifestations are a well-known postmeningococcic sequel with or without meningococcemia electrocardiographic changes have been interpreted as due to myocarditis, although the ST elevation changes and T wave negativity may occur in acute The ST elevations were, however, pericarditis transient and not very striking at any time. It is interesting to note that an electrocardiographic pattern typical of pericarditis has been noted clinically 31 and experimentally22 secondary to sulfonamide administration with subepicardial necrosis as a postmortem finding in both instances

French and Weller<sup>23</sup> have reported interstitial myocarditis associated with sulfonamide therapy and have reproduced an eosinophilic type of diffuse myocardial reaction in animals given therapeutic doses of sulfonamides Wells and Sax<sup>24</sup> have reported a case of isolated myocarditis probably of

sulfonamide origin

Obviously, the differential diagnosis in our case includes meningococcic myocarditis, meningococcic pericarditis, sulfonamide myocarditis, and a concomitant acute rheumatic fever. The pericarditis has been excluded for the reasons given above, the persistence of the findings long after withdrawal of the sulfonamide tends to exclude it as a factor, acute rheumatic fever cannot be ruled out.

We believe that recognition of the cardiac involve-

ment and further observation of the process by clinical and laboratory measures may have obviated further complications.

#### Summary

- 1 We have reviewed briefly the partinent litera ture.
- 2 The problem of infectious myocarditis has been stressed
- A clinical case of postmeningococcie myocarditis has been presented
- A plea has been made for intensive study of all infectious cases for the possibility of cardiac involvement

#### "DOCTOR JONES" SAYS-

Is general practice of medicine becoming a specialty? That question was the subject of one of the best articles I ve read in some time. It was by a specialist an Albany surgeon. His answer is that, of all the various fields of medicine, the most essen tial and the most difficult the one requiring the broadest knowledge and involving the hardest work. is that of general practice. And yet, as he infers, all the recognized specialists get paid more for their services than the general practitioner does. He thinks he, too, should be rated as a specialist and paid on the same scale as the others.

He says he sin t talking about the "intellectual and physical loafer the fellow that when he gets his medical degree, considers his education complete and settles down to being a mere pill-peddler There's that kind of course, in every profession And being able to graduate from a medical school and pass licensing examinations is no guaranty that they'll be good doctors He s talking about the ones that re not only well educated and trained but road their medical journals, attend meetings and post-graduate lectures and know their stuff and their limitations, in other words, the ones that re competent.

Eighty five per cent of human ills, this surgeon

eays could be adequately cared for by the competent general practitioner. He cites the treatment of gonorrhea as an example. The average case he says can be cured inside of three days with peni 'Why,' he says should one man receive a cillan larger fee than another both using the same drug and the same technic in uncomplicated cases? And if any of us, he says were where we could only have one doctor who wouldn't feel eafer with a competent general practitioner than with one from any

other medical group? Naturally I agree with him But the very fact that, as he says, the general practitioners are the public s first and last line of defense against disease raises another question. What about the thousands of low income but self respecting and, ordinarily self-supporting families that can't even afford the foes he charges now-inadequate as they are? How to take care of them in my opinion is the one impor tant feature of this so-called medical care problem. If they'll give these general practitioners a chance and a little encouragement, maybe they il work it out.—Paul B Brooks M.D. Health News June 9 1947

#### INTERSTATE CONFERENCE TO AID RABIES CONTROL

The latest development in New York State s program to control rables is the participation of its Department of Health in an exchange of ideas and information among several Northeastern states.

Results of an initial interstate conference here have been viewed by Dr Akxander Zeissig, rabies consultant in the Department, as another forward step in our effort to bring rables under control particularly in curbing the spread of the disease from one state to another

The meeting brought together representatives from Vermont, New Hampshire, Massachusetts, Rhode Island Connecticut Pennsylvania, New Jer

soy New York, and Georgia The United States Public Health Service was also represented

Dr Zeiseig outlined the control program in New York with specific reference to the disease in dogs Gardner Bump superintendent of game in the Concarvation Department, discussed the control program in the state as it is being applied to foxes Dr E. V Moore deputy commissioner of the Department of Agriculture and Markets spoke on con-trol of rables in cattle A general picture of the attuation throughout the nation was presented by Dr James H Steele U S Public Health Service Dr Robert F Korns, assistant director of the Divi sion of Communicable Diseases, presided.

# RITTER'S DISEASE IN FRATERNAL TWINS, WITH SPECIAL REFERENCE TO THE PATHOGENESIS

ALEXANDER S WIENER, MD, FACP, Brooklyn, New York

(From the Serological Laboratories of the Office of the Chief Medical Examiner of New York City)

N 1878, under the title of dermatitis exfoliativa neonatorum, Ritter von Rittershain described a rare exfoliating skin disease of newborn infants This disease is so rare that only occasional reports can be found in modern medical literature, but a good account of the disease is given in most standard texts on dermatology, as in Ormsby and Montgomery 1 The etiology and pathogenesis of Ritter's disease has never been satisfactorily elucidated, Ritter himself believed that disease to be pyogenic Some workers have classified this disease as a malignant form of pemphigus of infants, others consider it a form of epidermolysis, while still others consider it merely an exaggeration of the normal ex-The purpose of this comfoliation of the newborn munication is to report the occurrence of this rare disorder in newborn fraternal twins, and to propose a theory to explain the pathogenesis of the condition

## Case Report

The patients were boy twins born on July 17, 1946, approximately seven weeks prematurely. While they closely resembled one another, blood tests performed later proved that they were fraternal rather than identical twins. The results of these blood tests on the parents and the twins are given below for purposes of reference.

Blood of	Group and Subgroup	M-N Type	Rh-Hr Type
Father	$\mathbf{A_1}$	N	Rhz
Mother	0	MN	rh -
Twin A	Ó	MN	rh
Turn B	Α,	N	Rh.

It will be noted that the mother is Rh negative and the father heterozygous Rh positive—In addition to the incompatibility with respect to the Rh factor, there is an incompatibility in the blood groups, the mother belonging to group O—and the father to group A—Since such incompatibilities can give rise to erythroblastosis fetalis, it may be stated at the onset that we had been aware of this situation during the pregnancy, because the mother was a research fellow who had been working in the field of the Rh blood types—Since this was the mother's first pregnancy and she had never received a blood transfusion or blood injection, there was no reason to anticipate the occurrence of erythroblastosis in the expected infants—In addition, tests on the maternal serum during pregnancy proved that she was not sensitized either to the agglutinogen Rh or to agglutinogen A \*

At birth, twin A weighed 4 pounds, 6½ ounces, while twin B weighed 4 pounds, 7 ounces. They were both kept in incubators and placed on a formula. By the time they were two weeks old they both weighed more than 5 pounds and seemed to be making satisfactory progress, so they were discharged from the hospital. About a week after their arrival home, reddening of the skin was noticed on both twins, particularly on the neck under the chin and in the groins. The lesions gradually spread and

covered the body so that soon the entire body was erythematous and covered with vesicles. The vesicles ruptured, then dried, and this was followed by exfoliation. While there was no recurrence of vesiculation, the process continued, so that after peeling occurred, the underlying skin remained edematous and reddened, and peeling recurred over and over again. The general condition of the infants began to go downhill, particularly in the case of twin A, whose cry became feeble and who fed poorly However, the course was entirely afebrile without any evidence at any time of the presence of infection.

One month after the onset of the disease twin A seemed critically ill and blood counts were done which showed the following Twin A had a hemo-globin concentration of only 55 per cent, a red blood count of 2,730,000 per cmm, white blood count of 11,000 per cmm with a differential count of neutrophils 29 (6 bands), small lymphocytes 33, large lymphocytes 30, monocytes 5, eosinophils 1, myelocytes 2 The blood smear showed anisocytosis and polychromasia, and there were 4 normo-blasts per 100 white blood cells The blood count on twin B showed a hemoglobin concentration of 72 per cent, a red blood count of 3,380,000 per cmm, white blood count of 12,000 per cmm, the differential count revealed 41 neutrophils (16 band forms), 38 small lymphocytes, 13 large lymphocytes, 4 monocytes, and 4 eosinophils The blood smear showed less pronounced red cell changes than in the case of twin A and there were only 2 normoblasts per 100 white blood cells Both twins evidently now had a secondary anemia, and the more severe anemia in the case of twin A corresponded with his critical clinical condition

Blood was drawn from the mother of the twins, and the red cells washed twice with saline solution. Fifty-five cc of the packed red cells diluted with a small amount of saline were then transfused to twin A, and 30 cc of the packed red cells to twin B Following the transfusions, the general condition of the twins improved markedly, especially in the case of twin A. While the exfoliation of skin continued for another month, the infants fed better, put on weight, and gradually improved in all respects. A report received, when the twins were four months old, stated that they were both entirely well, twin A weighing 10 pounds 9 ounces and twin B 10 pounds. Since this paper was completed, the twins have continued to develop normally, and to date (July, 1947) there has been no recurrence of the skin dis-

Two alternative explanations suggested themselves to account for the occurrence of Ritter's disease in the fraternal twins,\* namely, that the condition was due to either infection or some sort of sensitization. The possibility of infection seemed to be excluded by the afebrile course of the disease its simultaneous appearance in both twins five weeks after birth, and the clinical course and blood

<sup>\*</sup> For a review of the most recent developments in the field of the Rh-Hr types and crythroblastosis see Wiener 2.3

<sup>\*</sup> This diagnosis which seems the only logical one to make in view of the clinical course of the disease was first suggested by Dr David Bloom when he saw the infants in consultation

count findings. With regard to isosensitization to the Rh or A factors as possible etiologic factors this was excluded for reasons already given, and, besides both twins were affected despite the difference in their groups and types, the twin with the compatible blood type being the more severely affected.

The mother was questioned as to the occurrence of any dermatologic lesion or any other type of sensitization in herself particularly during preg nancy She then stated that during the sixth month of pregnancy she had had a severe attack of poison ivy dermatitis.\* The leaons which first appeared on both knees and on the neck, later spread over almost the entire surface of the body involving the abdomen breasts, and both arms up to the elbows. The lesions gradually cleared but vesicles were still present up to one week before the delivery of the twins.

In view of this history the following hypothesis suggested itself to explain the occurrence of exfoliative dermatitis in the twins. The toxic princi ple in posson ivy responsible for the dermatitis in the mother presumably combined with her skin proteins and altered them sufficiently so that they became antigenic and stimulated the production of skin antibodies. The skin antibodies in turn combined with skin proteins on other parts of the body giving rise to erythema and vesiculation of previously unaffected portions of the skin surface. This could account for the particularly severe and extensive nature of the dermatitis in the mother The skin antibodies would be capable of traversing the pla cental barrier into the fetal circulation, where they could combine with the skin proteins of the fetus. As is well known, the skin of newborn and particularly premature infants is refractory to antigon antibody stimuli This could account for the delayed onset of the disease in the infants until five weeks after birth Thus, the hypothesis would account for the occurrence of the disease in both twins simultaneously in the absence of any evidence of infection and despite their difference in blood groups. It would also account for their complete recovery which would be expected after the skin antibodies were exhausted, provided the infants did not die from the effects of the dermatitis. An attempt was made to demonstrate the presence of skin antibodies in the serum of the mother of the twins by injecting some of her serum intradermally into three volunteers including the writer and the nationt herself. The injections did not cause the appearance of any lesions but inasmuch as this test was done four months after the birth of the twins the antibodies may well have disappeared by this time. It is hoped that this report may help to call attention to the possibility of skin antibodies as an etiologic agent in other similar or related cases so that tests can be made at the height of the disease DECCESS

As experimental evidence supporting the thesis of skin antibodies the work of Hecht, Sulzberger and Well<sup>4</sup> may be cited. In experiments on rabbits these workers found that unaltered skin protein was not antigenic for animals of the homologous species However when the skin protein was altered by mixing it with staphylococcus toxin, the production of skin antibodies could be stimulated. That autoantibodies against other tissues besides skin can give rise to pathologic changes has also been suggested in the past. The role of the autohemolyans and autohemagglutining in the pathogenesis of hemolytic anemia is well known. In addition autoantibodies against kidney proteins have been blamed for the pathologic changes in chronic nephritis autoanti bodies against liver for the changes in these organs occurring in cases of henatitis and autoantibodies against lens protein and other ove proteins for the syndrome of sympathetic ophthalmia.

#### Summary

An unusual case of Ritter's disease in fraternal premature boy twins is described. The mother of the twins gave a history of poison ivy dermatitis near the end of her pregnancy which was unusual in its severity and in the extensive distribution of the lesions. The hypothesis is proposed that the toxic principle of the plant combined with the mothers skin proteins altering them sufficiently to make them antigenic thus stimulating the production of skin antibodies These antibodies, combining with skin on other parts of the mother's body would account for the extensive distribution of the lesions on her body In addition the antibodice passing through the placenta into the bodies of the twins could also account for the occurrence of the exfoliative dermatitis in them.

#### J E. KING ESTATE WILLED TO UNIVERSITY

Dr James E. King, 71 years old, who died March 0, left the bulk of his estate valued at between \$200 000 and \$500 000 to the University of Buffalo King, a graduate of the University's School of Medicine, joined its teaching staff shortly after his gradua tion and remained a faculty member until his retirement in 1040

#### NEW HOSPITAL TO OPEN

The X Ray Hospital at 10 Morris Park West Non York City which was closed last September has been sold to a group of negro doctors who will operate it as a private and semiprivate hospital for both white and negro patients

The Hospital can accommodate between 50 and 64 patients.

This was contracted when the moth rof th twins accompenied her hu hand n engineering student during a urvey ing expedition at Bantam, Connectiont. Her husband also contracted by dermatitis but in a mu h milder form.

# CHRONIC PROGRESSIVE BACTERIAL SYNERGISTIC GANGRENE

A I CALIENDO, M D Brooklyn, New York

(From the Norwegian Hospital)

A WHITE man, 37 years of age, in generally poor physical condition with a poor hemic component, was admitted to the hospital with a small penetrating chest wound in the midavillary line of the left chest wall The wound was about 7½ cm long and 5 cm wide, extending into the subcutaneous tissues. No other chest signs or symptoms were present and \rays of the chest were negative on ad-Ten days after admission, the patient began to bleed profusely and intermittently from his wound, from what appeared to be an infected hema-He was taken to the operating room because of the continued profuse bleeding, which had resisted all treatment to stop it

The hematoma was evacuall treatment to stop it ated until healthy tissue presented. The bleeding stopped entirely. It was further treated with hot saline packs and sulfanilamide powder was frosted into the wound

One week following evacuation of the hematoma. the patient started to bleed again from his wound Bleeding and coagulation time taken previously were reported within normal, and further blood studies did not reveal the presence of a blood dyscrasia On examination of the wound, it was found to be grossly infected and had a purplish appearance with thick pus present Further investigation revealed the presence of a large amount of grayish, soft, infected clots Pus and clots were removed for culture as had been done at the previous dressing

The following laboratory report was received from

these cultures

The aerobic culture revealed gram-positive cocci in pairs, clusters, and short chains, staphylococcus aureus, and streptococcus hemolyticus

The anerobic culture had small gram-positive cocci in pairs and long chains, a microaerophilic streptococcus, and some gram-positive bacilli which might be Bacıllı Welchii

This report was thought corroborative of chronic

progressive bacterial synergistic gangrene

Following a blood transfusion of 500 cc of citrated whole blood, the patient was taken to the operating room under general anesthesia The wound was inspected again and found to contain the same soft, gravish blood clots found previously

The edges of the wound were gangrenous with a purplish border and it must be mentioned here that the continuous use of sulfa drugs and penicilinlocally, orally, and by injection—had absolutely no beneficial effect on the wound or progress of the dis-Therefore, a radical excision of the ulcerous wound was done in toto, down to clean tissue and to include a margin of 1 to 2 cm of normal skin. The edges of the wound were undermined for 1/2 to 1 cm All bleeding points were controlled and the wound was packed with a paste of activated zinc perovide, packing it well under the margins of the

A postoperative blood transfusion of 300 cc of citrated whole blood was given the following day and penicillin and sulfadiazine were continued as well as other supportive treatment Blood counts were repeated at intervals and small blood transfusions given until blood count and hemoglobin were within normal limits

Following the operation, this patient's wound stopped bleeding and granulated in uneventfully, so that three weeks later we were able to apply pinch skin grafts, which were successful, and healing was completed. The patient, fully recovered, was fi-nally discharged from the hospital

# WHAT DOES THE MEDICAL SOCIETY OF THE STATE OF NEW YORK DO FOR ITS MEMBERS? The State Journal and Directory

Every member of the Society is entitled to a year's subscription of the New York State Journal of MEDICINE, which presents, in addition to pertinent editorials and scientific articles, sections devoted to personal, hospital, and general medical news, necrologies, and book reviews The Directory gives the names of all doctors engaged in practice in New York, New Jersey, and Connecticut, together with their hospital and society affiliations, lists of accepted hospitals and their staffs, and much additional information of interest to the profession. This work is a standard of references and is widely used for this purpose by various organizations It is more complete in its details than any similar publication

Annual Report of Malpractice Insurance and Defense Board

To the House of Delegates-Gentlemen

The Malpractice Insurance and Defense Board was created by an amendment to the Bylaws of the Society adopted by the House of Delegates on April 30 1046 Under authority of that amendment the president appointed the following members of the Board

Dr J Stanley Kenney for one year Dr Thomas M D Angelo for two years

Dr James M. Flynn for three years Dr Charles Gordon Heyd for four

Dr Charles Gordon Heyd for four years Dr John F Kelley for five years

Upon the death of Dr James M. Flynn the pressdent appointed Dr Leo F Schiff for the unexpired

As directed by the Bylaws, the following were automatically named as ex officio members of the Board

Dr Walter P Anderton, Secretary of the Society Dr James R. Reuling, Treasurer of the Society Mr William F Martin, Legal Counsel

Mr Harry F Wanvig, Indemnity Representative

At its first meeting the Board elected Dr J Stanley Kenney chairman and Mr Harry F Wanvig, secretary

Four of the original members of the Board, having served on committees on malpractice defense and insurance, were thoroughly familiar with this ac-

uvity of the Society

Policy With Respect to the Consideritial Nature of Information Regarding Suits Lost or Settled out of Court —Since the inception of the Group Plan in 1921 it has been the fixed policy of the Society to discourage publication of any information regarding suits against members which are lost or settled out of court. This policy was reviewed to determine what changes, if any should be made in it. The Board concluded that the publication of any information tending to show that suits against medical men can be recognitive. be successfully prosecuted would only serve to en-courage additional suits and that, therefore, the policy of the Society should be continued without change To give effect to this conclusion, the fol-lowing resolution was adopted by the Board

Wheneas, it is believed that it is not in the best interest of the Medical Society of the State of New York and the general welfare of its mem-bers to permit any publicity as to suits and claims against members which are lost or settled out of

Whereas such publicity can serve no useful purpose but, on the contrary will provoke harm and suffering to the various defendants and will provide ammunition for unfriendly individuals to use against members of the Society

'Now therefore be it resolved, that the relation-ship with respect to such suits and claims, between the insurance company carrying the Group Plan and/or the Society and its members must at

all times be assumed as confidential.

Revision of the Policy Contract With Respect to Cosmetic Plastic Surgery - Believing that some revision of the policy contract was desirable to clarify the exclusion of so-called 'cosmetic plastic surgery the Board adopted the following rewording of the exclusion and requested the Yorkshire Indemnity Company to incorporate the change in the policy contract when a new supply of policy forms is printed

'arising by reason of the performance of any plastic surgical operations except when made necessary by trauma, congenital deformities, or by demonstrable pathologic lesions, and for the sole purpose of improving physical health

Proposal to Establish a Separate Fund to Fur nish Legal Defense for all Members —At the request of the Council the Board made a study of this proposal and returned it to the Council with the follow ing report and recommendations

The purpose of this resolution is to distribute the cost of all legal defense to all members in order to climinate that cost from the operation of the Group Plan of Malpractice Insurance and Defense and thus, reduce the cost of insurance to insured mem-bers. It is pointed out by Bronx County that at present insured members pay the same dues as uninsured members and that some part of their dues is allocated to the defense of uninsured members and that this is inequitable.

After thorough consideration of all the elements involved the Board unanimously agreed to recom mend to the Council that this resolution be dis-

approved for the following reasons

(a) The annual cost of defending uninsured mombers is a relatively small part of the cost of the Society's legal service and thus, absorbs an insignificant part of the membership dues. Therefore, the inequality of the present arrangement if there be any, can hardly be of any real importance to any member

There are in the Society an indeterminate but large number of members who are not in the practice of medicine in circumstances which make them hable to malpractice actions Such members have no need for malpractice insurance or legal defense, yet they pay the same dues as members in private practice and thus contribute to the maintenance of defense service for which they have no need If this resolution were approved, it would penalize such members by increasing their dues to help pay the cost of defense of insured as well as uninsured members This would certainly be inequitable and it is not believed that one inequality should be cured by creating another
"(c) The Society would, if this resolution were

approved, undertake to pay the cost of the defense of suits insured by a private insurance company and the legal counsel is of the opinion that the Society would not be permitted to use any part of its funds

for such a purpose

It is believed that the State Insurance Department would not approve such an arrangement and it is not believed that any reputable insurance company would undertake the Group Plan of the Society on that basis"

This recommendation of the Board was approved by the Council at its meeting on March 13, 1947

Proposal That the Legal Counsel Prepare and Send To the Comitia Minora of Each County Society a Yearly Statement Showing the Number of Members Insured, the Number of Suits and Claims Filed as Be-tween the Insured and Uninsured, the Number Settled Together With the Manner and Cost of Disposing of Them —At the request of the Council the Board made a study of this proposal and returned it to the Council with the following report and recommendations

If approved, this resolution would require setting up in the office of the legal counsel or indemnity representative an additional and entirely new accounting system whose only use would be to furnish In all hability insurance acthe proposed reports counting, suits and claims reported, and the cost of disposing of them are charged against the policy years involved and not against the calendar year in which they are filed or settled. Thus, during any one calendar year, the suits and claims filed and those disposed of pertain to as many as five or six policy years and this system cannot be altered If the need for the information called for by this resolution were great enough, it might be worked out on a state-wide basis at considerable cost information had to be divided between 61 counties the task would be difficult and the expense nearly prohibitive

The Board points out that a report in great detail covering the Society as a whole but in an entirely different form is being furnished the Board annually and has been furnished each year since 1924

There are a number of the smaller counties in which there have been few, if any, suits over a number of years. This fact is meaningless, however, from an insurance standpoint because insurance is based on the law of averages which does not apply to the loss experience of any small group an individual, the loss experience of a small group when considered alone becomes a matter of chance or luck which is a gamble Thus, a small group might have no losses for a long period of time but, on the other hand, it might have one or several losses in quick succession which, insurance wise, would put it in the red for many years Yet, if the lack of suits in the red for many years in any one county were brought to the special attention of the comitia minora of that county, it might create a great deal of unjustified dissatisfaction

Although the representatives of the Bronx County have stated that they do not want the names of the sued members given or identified in any way, it is obvious that detailed information as to suits filed and settled in many of the smaller counties would point unerringly to the doctors involved whether their names were given or not and might do irreparable harm to them in their communities

In the opinion of this Board the most important objection to this proposal is that it would give publicity to the number and cost of suits lost or settled Since the inception of the Group Plan twenty-five years ago it has been the fixed policy of the Society to give out no information whatever concerning such suits to anyone except the members of the Committee on Malpractice Defense and Insurance and officers of the Society After careful consideration that policy was reaffirmed at the first meeting of this Board on October 24, 1946, in the resolution quoted

in paragraph 1 above

After consideration of these factors the Board was unanimously of the opinion that the dissemination of this information would be contrary to the best interests of the Society and recommends to the Council that this resolution be disapproved The board further recommends that if authorized members of any county society desire special information regarding the situation within their own society, applications for such information should be filed with this Board which, in so far as is consistent with the policy of the Society, will endeavor to supply the required data

This recommendation by the Board was approved

by the Council at its meeting on March 13, 1947
5 Annual Audit of the Group Plan—Pursuant to the instructions of the Council and in accordance with the directive of the House of Delegates, the Society's accountants, Messrs Hackeling and Oberkirch, have made an audit of the Group Plan of Malpractice Insurance and Defense, a copy of which was transmitted to the Council

The Board studied the audit and discussed it in detail with Mr Hackeling and Mr Wanvig and offered the following comments regarding it

- Scope The audit covers all the essentials of the Group Plan for the eleven years, January 1, 1936, to December 31, 1946
- Loss Vouchers As directed by the House of Delegates, the accountants made an examination of the loss vouchers This was accomplished by analyzing each voucher and drawing off an independent summary of all of them Spot checks were then made of the original data underlying and supporting a large percentage of them in the office of the Yorkshire Indemnity Company Approximately 1,600 vouchers were involved and amounted to a total of \$1,497,445 42 This total when compared with that reported by our indemnity representative showed a difference of only \$10
- Loss Reserves In the insurance business loss reserves are as much a part of the total loss ex-perience as are the paid losses. These reserves perience as are the paid losses. These reserves which amount to \$943,490 82 are divided into two classes, 1e, those for suits and claims which have been reported but which have not yet been settled, referred to as outstanding, and those referred to as to arise The latter are cases not yet reported but which experience has shown will be filed at some future date for acts committed prior to December 31, 1946, and for which policies issued prior to that date are liable

(b) Outstanding Cases The reserves for these cases are estimated on a case basis by the legal counsel of the Society and the manager of the claim department of the Company The estimates are reviewed four times each year and revised in the light of what is known about each case at that time a result the reserves as a whole for these cases are always adequate and usually produce a saving or salvage which is applied as a credit to the total ro-

serves set up for cases in this category (c) To Arise Cases The reserves for these cases are very difficult to estimate because no one can look forward and determine, with any degree of certainty how many actions will be reported during the next four or five years for acts committed at some time in the past, nor how much it will cost to dispose of them. Nevertheless an effort is made to determine the number of such cases on a mathematical basis by applying to the current policies the ratios of the number of cases which were reported in the past Except in unusual years, this mothod is fairly accu rate as to the number which will arise but in esti mating the money value of these future cases, substantial errors occur However over a period of years the over estimates of good years would nor mally offset the under estimates of high cost years. Due to the recent increase in number and cost of closed cases, these reserves have proved to be in adequate and this factor was largely responsible for the deficit in operations which accrued at the end of While the deficiency in these reserves had been reported to the Board earlier in the year by Mr Wanvig, it was noted and commented on by Mr Hackeling.

Income and Disbursements (a) After a careful study of the audit the Board wishes to point out that it contains matter considerably outside the agreement with the Company under which the

Group Plan is operated

It should be recalled and emphasized that the Group Plan is and always has been an agreement or understanding which provides that the Company will insure the members of the Society under the terms of a master policy issued to the Society as trustee for the members at rates for the minimum limits of \$5,000/\$15 000 based upon the actual losses up to \$5,000 plus predetermined and fixed percentages for operating expenses and profit. That is all the Actna or the 1 orkshire ever agreed to do so far as rates are concerned and that is all the Society has guaranteed to its members.

(c) It is true that the Society exercises a large measure of control over the policy contract, the underwriting practices, the defense of suits and claims, the cost accounting, and computation of rates, but the operation of the Group Plan as an insurance enterprise is, and under the law it must be, a part of the business of the Company While the premiums paid are credited to the operation of the Group Plan they belong to the Company and in no way constitute a fund of the Society Similarly the losses and loss reserves are charged against the opera tion of the Group Plan but they are liabilities of the Company not the Society Thus, while the Society exercises what might be called managerial super vision over the operation of the Group Plan it, as a corporate entity has no responsibility for the funds or liabilities which that operation involves.

(d) The Society may, with propriety have made any kind of an audit which it considers necessary to ascertain whether the terms of the carrying agreement have been lived up to, whether the loss costs have been accurately tabulated, and whether the rates have been correctly computed. That has been done as attested by this audit. However this audit was carried beyond that point and this was made possible by the full cooperation of the Company in supplying the accountants with whatever data they requested But, in doing so the officials of the Company made it plain that they expected the Board and officers of the Society would recognize the confidential nature of some of the information fur nished and that they would treat it accordingly

Underwriting Results (a) The above remarks apply likewise to the underwriting results of the Group Plan referred to as Reservo Excess or

Deficiency

The audit shows that while a substantial deficit occurred in the insurance of losses up to \$5 000 a profit resulted from excess limits. the adjustment of rates for excess limits does not come within the carrying agreement, the lorkshire has felt obligated to reduce the excess rate table whenever the profits from excess limits exceeded what was believed to be a prudent reserve for what might be called catastrophy losses. Two adjustments of that kind have been made in the last eleven years and similar reduction may be expected when ever the situation warrants it.
6 Total Loss Experience The total loss experi

once is found by combining the loss reserves with the paid losses as represented by the vouchers. From the audit the Board finds that the combined total

amounts to \$2,440 936.24.

Conclusion Since the audit could not be distributed to the county societies without violating the confidence of the Company and Jeopardizing the cordial and valuable relations which the Society has with the Company the Board recommended that, in lieu thereof the Council send to the comitia minora of the county societies a report containing the follow ing information

(a) As directed by the House of Delegates, an audit of the Group Plan of Malpractice Insurance and Defense including an examination of the loss vouchers, has been made by independent certified

public accountants

Because the audit was found to contain information which belongs exclusively to the Com pany the Society does not have the authority to

publish it.

(c) The audit has however been carefully studied and found to show that the carrying agreement under which the Group Plan is operated has been fully complied with the loss costs have been accurately tabulated, and the rates have been cor rectly computed as indicated by the following which is quoted from the audit by Mesers. Hackeling and Oberkirch

Your attention is directed to the fact that a \$32 annual premium (on \$5 000/\$15 000 limits) rate is substantially correct for this type of coverage if we

can assume

'A. A continuance of the present high costs of sottling claims and

There is to be no reduction in the deficit sus-В tained to date and

The gain on other types of coverage is not to be considered in establishing rates for the

\$5000/\$15 000 coverage 6 Remsion of Rule as to Effective Date of New Insurance in the Group Plan.—Insurance in th Group Plan is by the terms of the contract, effective at 12 01 A.M. Therefore, insurance negotiated on any given date automatically covers all acts com mitted on that date including those committed prior to ordering the insurance. This amounts to ante dating all insurance as to claims on account of acts committed on the commencement date of the As this could have led to abuses if not corrected, the Board recommended that the Council

For the year, May 1, 1946, to May 1, 1947, the Committee on Public Health and Education, with the cooperation of the New York State Department of Health, arranged for instruction to be presented in 38 counties with a total of 174 lectures

Arrangements have been made for instruction to be given in the near future in the following counties Cayuga, Cortland, Nassau, Oswego, Rockland, St Lawrence, Saratoga, Schenectady, Seneca, Sullivan, Tioga, and Tompkins

Arrangements have also been completed for instruction to be given in the fall in Cayuga, Cortland, and Oswego County medical societies

Clinton County has indicated a desire for a series

of lectures to be given in the fall

The following Regional Cancer Teaching Days will be held in the near future

Supplementary Report of the Council—Part II Maternal and Child Welfare

At the request of the New York State Department of Health, a conference of the Council Committee on Public Health and Education, and the Committee on Maternal Welfare was held in New York City on April 9, 1947, to discuss the development of a colored film library to be available for speakers in post-graduate instruction Dr Edward C Hughes, graduate instruction member of the Committee on Maternal Welfare, was requested to obtain information regarding subjects to be considered for color films and to inquire about films being produced by the nine medical schools in the State Present at this conference, in addition to the Committee members, were some of the officers of the Medical Society of the State of New York and representatives of the New York State Department of Health

Section 11 (See 58)

Supplementary Report of the Council-Part IV Public Health Activities

BCG Immunization —The President of the Medical Society of the State of New York designated tentatively the following physicians as members of the Advisory Committee on BCG to the Council Committee on Public Health and Education and the New York State Department of Health

Milton I Levine, M.D., Chairman, 1111 Park Avenue, New York 28 Edith H. Lincoln, M.D., 660 Park Avenue, New

York

James R Reuling, M D, 217-06 40th Avenue, Bayside

Robert A Ullman, M D, 1171 Delavan Avenue, Buffalo

At the meeting of the Council of the Medical Society of the State of New York on March 13, 1947, it was voted that the above members as designated by

the President, be approved

The New York State Department of Health also nominated four physicians as members of the BCG

Advisory Committee

Robert E Plunkett, M D, assistant commissioner for tuberculosis control, Division of Tuberculosis control

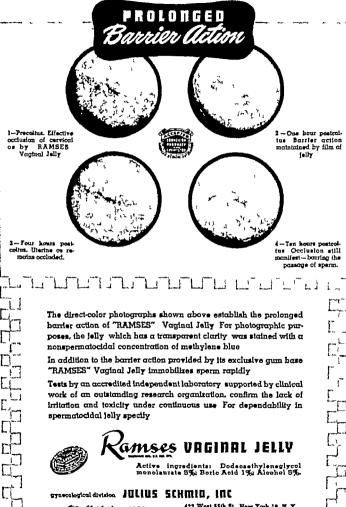

Julius Katz, M D, Division of Tuberculosis Control

Gilbert Dalldorf, M.D., director, Division of Laboratories and Research

Konrad Birkhaug, M.D., Division of Laboratories and Research

Meetings of the BCG Advisory Committee were held in New York City on March 12 and April 19, As a result of these conferences, the following Preliminary Report Subject to Later Minor Revisions was submitted by the Chairman, Dr Levine Present at these conferences, in addition to the members of the Advisory Committee, were members of the Council Committee on Public Health and Education, some of the officers of the Medical So-

ciety of the State of New York, and representatives of the New York State Department of Health

Preliminary Report Subject to Later Minor Revisions of the Advisory Committee on BCG Vaccination to the Medical Society of the State of New York and the New York State Department of Health

### Status of BCG Vaccine

(a) Safety On the basis of over 5,000,000 vaccinations throughout the world it has been established that BCG vaccine, properly cultured and controlled,

is harmless

The vaccine, (b) Reactions from Inoculations when administered in the manner advised (by the multiple puncture method, by scratch, or intracutaneously) produces a local lesion which at the most leaves a scar resembling that of vaccination against smallpo. In a certain number of instances of intracutaneous inoculation, suppuration of the lymph nodes draining the area may result which subsides in a few weeks Such a result, however, is probably due to subcutaneous rather than intracutaneous inoculation No fever is associated with the reaction and no pain or disability

(c) Effectiveness of BCG vaccine Experimental studies on human beings seem to indicate that the vaccine, properly cultured and used, is effective in

the prophylaxis against tuberculosis

### Preparation of BCG Vaccine

In order to have uniform material and controlled distribution there should be one central laboratory (the New York State Department of Health is suggested) for the preparation and distribution of BCG vaccine in New York State

(b) The lot number as well as the date of expira-

tion must be placed on each vial of vaccine

The vaccine is to be tested regularly in the (c) central laboratory for virulence, potency, and free-

dom from contamination

The concentration of BCG vaccine differs with the mode of vaccination A lower concentration (10 mg/ML) is used in the intracutaneous method than in the multiple puncture or scratch method, where 20 mg/ML is used Therefore, the BCG vials should be clearly distinguishable as to concentration of vaccine contained

### Recommendations on the Use of BCG Vaccine

(a) Only tuberculin-negative persons are to be

(b) In determining tuberculin sensitivity it is advised that only the intradermal tuberculin test be used with either dilute old tuberculin or preferably purified protein derivative

Uniform procedure recommended for tuberculin testing

When a purified protein derivative is used 0 00002 mg should be the first testing dose and 0 005 mg the second. When old tuberculin is used, a first test of 0 01 mg should be employed If this is negative. 0 1 mg should be injected as a second test

Tests are to be read forty-eight to seventy-two

hours

Roentgenograms of the lungs should be made (c)

at time of skin testing

(d) The BCG vaccine is to be administered by the scratch method, intracutaneously, or preferably by multiple puncture

Oral and subcutaneous methods are not to be used In the intracutaneous inoculation the recommended dosage is 0.1 mg of the standard product

(e) If at all possible, vaccinated persons should be prevented from coming in contact with open cases of tuberculosis for six to eight weeks after vacci-

All vaccinated persons should be tuberculin **(f)** tested two months after vaccination and every two Tuberculin negative persons thereafter years

should be revaccinated.

Each vaccinated individual should have in his possession a statement that he has been vaccinated This statement should be shown to any physician consulted thereafter

Standard records furnished by the State Department of Health are to be filed for each patient

vaccinated

### Distribution of BCG Vaccine

The distribution of BCG vaccine should be limited for the present to (1) medical colleges, (2) superintendents of public tuberculosis hospitals and directors of tuberculosis clinics and (3) selected additional hospitals and institutions under supervision of specially trained doctors who have been designated by the Commissioner of Health of the New York State Department of Health

The vaccine is recommended for use (1) where there has been a known exposure to tuberculosis or where an exposure is likely to occur, (2) in groups occupationally exposed (e.g., nurses and medical students), and (3) in selected population groups with high tuberculosis morbidity and mor-

tality\_rates

Education Concerning BCG

(a) Professional groups The education of physicians and nurses concerning BCG is to be given by physicians experienced with BCG

(b) Public education Education of the public should be under the New York State Department of

Health and the local health authorities

### BCG Administration

There should be a central administrator for BCG immunization control in the New York State Department of Health, Albany, New York
It is recommended that the duties of the adminis-

trator include the following

(a) Control the production and distribution of BCG

Assume responsibility for education of physicians as well as the public concerning its use

Keep the records and all reports necessary

regarding the BCG inoculations

(d) All records of BCG moculations are to be kept in duplicate, one for the administrator in Albany and the other to be retained locally

This administrator is to be responsible to the Assistant Commissioner for Tuberculosis Control of the New York State Department of Health

Mental Hygiene -On March 29, 1947, in New York City, a meeting of the Council Committee on Public Health and Education and the Subcommittee on Mental Hygiene was held Present at this conference, in addition to the Committee members, were some of the officers of the Medical Society of the State of New York and the Commissioner of Mental Hygiene in New York State It was agreed, time permitting, that a preliminary report regarding the mental hygiene program in New York State would be presented to the House of Delegates

Training and Licensing of Physiotherapists in the State of New York.—The following communication addressed to Dr W P Anderton, Secretary, Medical Society of the State of New York, was read at the

What does S-M-A stand for?

5-M-A ? A certain baby (wise beyond his years) explains those in triguing letters. "Sure Merits Approval."

But the baby's physician and his colleagues say, "S M A? Why, it stands for Several Major Advantages" Some of those advantages which appeal especially to doctors are shown in the comparative analysis below

### S-M-A AND MOTHERS MILK ARE THE SAME IN ALL THESE IMPORTANT RESPECTS:

FAT—S-M A fat is like breast milk fat. The same Reichert Meissel, iodine, saponification and Polenske numbers same retractive index and melting point.

CARBOHYDRATE-Lactose only

PROTEIN-Low huffer action, low curd tension, same amino acids essential to growth

VITAMINS—S-M A contains all the essential vitamins except vitamin C—a requirement satisfied by regular orange or tomato juice supplement.

MINERALS.—S-M A contains all the minerals known to be essential for babies. Calcium and phosphorus are in proper balance; iron content is ten times that of human milk.

S-M A\*1s antirachitic and is as easily digested as breast milk S-M A infants develop firm tissue turgor and their nutritional history resembles that of breast fed infants.

When they start on cereal Gerol®has all nutritional advantages, plus that delicious papaya fruit flavor

The University of the State of New York The State Education Department Albany 1 New York

February 6 1947

Dr W P Anderton 292 Madison Avenue New York, N Y Dear Dr Anderton

Dear Dr Anderton

I am writing to you as Secretary of the Medical Society to express my concern with respect to the training and licensing of physiotherapists in the State The physiotherapy law, as you know requires four years of training which is more or less equivalent to the training expected of a physician The law also provided a grandfather s clause which resulted in the admission to the profession of physiotherapists variously trained prior to the effective date of the law As a result we have in the profession at the present time a considerable number who did not have, in all respects satisfactory education and training Moreover because of the high requirements of the law we have not licensed any physiotherapists since the law went into effect Because of the high standards we have been unable to register a single school of physiotherapy in the country

On the other hand we have a number of institutions training so-called physical therapy technicians. These technicians are serving the medical profession and are in my opinion practicing physiotherapy without a license. This has resulted in my opinion in a thoroughly unsatisfactory situ-

I am writing to suggest that the Medical Society appoint a committee to make a study of this entire problem. I would hope that the committee would consult the physicians and arrive at a program of study which would be satisfactory to them. I am not convinced that this program of study should be or that it needs to be four years in length even for those who start with no professional or even allied training. It would seem altogether possible to take graduates of physical education schools and graduates of schools of nursing and give them a course of training of one or two years duration and thereby turn out a product which would meet the needs of the medical profession and the people of the State.

I would be pleased to have your reaction to my suggestions and if I can be of any service in connection with this problem. I would hope that you would feel free to call upon me ation

With kind regards I am

Cordially yours

/s/ J HILLIS MILLER

After discussion, it was voted to refer this matter to the Council Committees on Public Health and Education, and Legislation

On April 9, 1947, in New York City, a joint meeting of the Council Committees on Public Health and Education, and Legislation was held to consider the problem of training and licensing of physiothera-pists in New York State A recommendation, that a carefully chosen Subcommittee of the Council Committees on Public Health and Education, and Legislation who are familiar with physiotherapy be appointed to make a study and to submit a report within the next few months, was submitted to the Council on April 10, 1947 This recommendation was approved by the Council and the Subcommittee will be appointed by the president at the next meeting of the Council

> Respectfully submitted O W H. MITCHELL, M D, Chairman Council Committee on Public Health and Education

April 24, 1947

Annual Report—Part VI Annual Report—Part VI Joint Committee of the Hospital Association of New York and the Medical Society of the State of New York

The Joint Committee of the New York Hospital Association and the Medical Society of the State of New York was composed of the following personnel

Medical Society

Carlton E Wertz, M.D., Chairman, Buffalo Walter W. Mott, M.D., White Plains J Stanley Kenney, MD, New York

Hospital Association

Hon Lee B Mailler, Chairman, Cornwall Morris Hinenburg, M.D., Brooklyn John F. McCormack, New York Moir P Tanney, Buffalo Carl P Wright, Syracuse

On December 5, 1946, Dr Wertz was instructed by the Council to transmit to this Committee the objection of the Medical Society of the State of New York to having medical services included in any contract between hospitals in New York State and

the US Veterans Administration

At a meeting of the Committee in the State Society office on December 30, 1946, Drs Wertz, Mott, Kenney, and Anderton represented the State Society, and Mr George P Farrell, Director of the Bureau of Medical Care Insurance, and Dr David J Kaliski, Director of Workmen's Compensation Bureau, were present The New York State Hospital Association was represented by Dr Hinenburg, McCormack, and MacDermott Messrs Rhoderick Wellmans, counsel for the Hospital Association, and Dr. M. J. Fein, secretary of the Joint Council of Radiologists, Pathologists, Anesthesiologists, and Physical Therapy physicians were present There was considerable discussion regarding proposed legislation to label the practice of radiology, pathology, anesthesiology, and physical therapy by physicians as part of the practice of medicine

On January 31, 1947, a similar meeting was held There was agreement upon the principle that the practice of any of these four specialties is the practice of medicine A bill naming the practice of radiology in this category was introduced in the legislature,

but was not passed.

It is hoped that this Joint Committee will be continued in order that conferences between the hospital association and the Medical Society may proceed to the formulation of legislation which will be mutually acceptable

Section 13 (See 65)

Supplementary Report of the Council-Part VII Public Relations and Economics

To the House of Delegates—Gentlemen

The Council Committee on Public Relations and Economics submits the following supplementary

At a meeting of the Subcommittee on Medical Expense Insurance of the Council Committee on Public Relations and Economics, April 4, 1947, standards of approval of New York State medical care plans by the Medical Society of the State of New York were drawn up and approved by that committee These standards are proposed as a protection to the medical profession in regard to the method of medica care plan operation and the distribution of medica services to the plans' subscribers, and are comparable to those standards adopted by the Council on Medical Service of the American Medical Association Recommendation was made that these standards be submitted to the Council of the Medical Society of the State of New York for approval

A recommendation was made at the Council meet mg, April 10, 1947, that the standards be presented to the House of Delegates for study and action The standards as approved by the Subcommittee are

submitted herewith

### [Continued from page 1812] Standards

Local Approval

1 Approval of the county medical societies in

whose area it operates

2 In the event a county society does not approve a plan, a special committee of three members be appointed, one by the plan, one by the county medical society, and one by the Medical Society of the State of New York, to investigate and study the reasons why approval was withheld

3 If it is the opinion of a majority of the committee, approval will be granted to the plan after

consideration

Professional Control

1 The Board of Trustees must contain a majority of physicians
2 That these representatives shall be members

2 That these representatives shall be members of the Medical Society of the State of New York 3 The medical profession to assume responsi-

3 The medical profession to assume responsibility for the medical services included in the benefits

Free Choice of Physician

I There shall be no regulation which restricts the choice of a qualified doctor of medicine in the locality covered by the plan, who is willing to participate and render service under the conditions established

2 The method of rendering the service must retain the personal, confidential relationship between

the patient and the physician

Subscriber Benefits

Subscriber benefits may be in terms of cash and/or service units

Claim Payments

1 When care has been rendered by a participating physician and claim filed for such care, payment shall be made direct to the participating physician When subscriber has paid the physician, then payment may be made to subscriber upon presentation of a receipted bill. This method of payment should be discouraged and should apply only in instances where subscriber has paid the physician

where subscriber has paid the physician

When care has been rendered by a nonparticipating physician and claim filed for such care, payment shall be made direct to the nonparticipating physician or to the subscriber upon presentation of

receipted bill.

Underwriting

1 Subscriber premium rates should be adequate to provide for the benefits offered and the risks involved in the contract

2 Plan should be organized and operated to provide the greatest possible benefits in medical care to

the subscriber

3 All plans shall conform with state statutes as set up under the New York State Insurance Department with due consideration for earned premiums, administrative costs, and reserves for contingencies Enrollment

Enrollment procedures shall be on a sound basis so as not to expose the plan to adverse selection

It is recommended that enrollment be offered to individuals at the earliest possible date that experience of the plan warrants

### Promotion

Descriptive folders and all promotional material will state clearly and accurately the benefits offered by a plan, and, also, in the same manner, exclusions in the contract

Reports

All plans which have received approval, or are seeking the approval of the Medical Society of the State of New York, shall submit quarterly reports on forms provided for that purpose, to the Bureau of Medical Care Insurance of the Medical Society of the State of New York

Duration of Approval

Approval by Medical Society of the State of New York shall be for a period of one year, at the end of which, review of all plans will be made by an appropriate committee of the Medical Society of the State of New York, to determine eligibility for renewal

Respectfully submitted, CARLTON E WERTZ, M D, Chairman Council Committee on Public Relations and Economics

Section 14 (See 97)

Supplementary Report of the Council—Part IX Legislation

To the House of Delegates-Gentlemen

The Council Committee on Legislation respect-

fully submits a supplementary report

The 1947 session of the New York State Legislature was one of the shortest sessions but one of the busiest. The Legislature convened this year on Wednesday, January 8, and adjourned on Tuesday, March 18. In that short period of time a record number of bills was introduced. There were 2,557 bills introduced in the Senate and 2,756 bills introduced in the Assembly, or 5,313 bills. Besides this record number of bills introduced, there was a record number of bills amended and many resolutions introduced.

The Legislative Committee was interested in following 119 bills in the Senate and 143 bills in the Assembly, in all, 262. As 105 of these bills were concurrent, this would mean that we were interested in 157 separate bills. Of the 157 bills in which we were interested, 114 were defeated in committee or not reported out by the end of the session, 43 passed both houses and were sent to the Governor. Thirty-three of these bills were thirty-day bills on which the Governor had thirty days, or until April 17, to take his final action. Of these 43 bills, the Governor has signed 35 and has vetoed 8

Among the bills that were defeated or not reported out of committee were the Farbstein compulsor, health insurance bill and the two Senate and the two Assembly bills which would set up licensure for the practice of chiropractic. The opposition registered by members of the medical profession and their friends against the bills for the licensure of chiropractic no doubt had a good deal of influence in preparation these bills having reported out of committee.

venting these bills being reported out of committee. As there was no bill introduced this year to prevent vivisection, we were not called on to campaign against such bills as in former years. A bill was introduced this year which would extend to the whole State of New York the provisions already applying to New York City relating to the stealing of dogs. The Legislative Committee registered no opposition to this bill and it was passed and became Chapter 345 of the Laws of 1947. There was also introduced in this session a bill to amend the Penal Law in regard to scientific tests on living animals. This bill provides that scientific tests on living animals shall be conducted in laboratories or institutions approved by the State Health Commissioner and subject to inspection of laboratory and to

standards fixed by the Commissioner for a certificate of approval The Legislative Committee did not go on record as being either in favor of or opposed to this bill. This bill was passed and signed by the Governor and became Chapter 408 of the Laws of 1947

At the request of the Medical Grievance Committee, the Legislative Committee had introduced in the Senate and Assembly a bill to amend the Education Law authorizing revocation, suspension or annulment of license, and registration of a medical practitioner for newspaper advertising for patronage. or for having been addicted to the use of drugs This amendment to the Education Law was proposed by the Grievance Committee The Grievance Committee was of the opinion that this amendment would strengthen and improve that section of the Education Law dealing with disciplinary procedures and that this change was necessary in view of their experience in handling such cases. The same bill was introduced in the Senate and Assembly. This bill passed the Senate but was defeated in the Assembly Education Committee, where the bill was amended removing that portion pertaining to newspaper advertising for patronage The amended bill in the Assembly was passed by that house and also by the Senate, and signed by the Governor It be-came Chapter 518 of the Laws of 1947 It is regrettable that the bill was not passed as introduced. as the restriction against newspaper advertising was thought to be very desirable. At the present time the best newspapers do not accept such advertising, only the newspapers that are essentially a local advertising medium and foreign-language newspapers make a practice of taking advertisements for physicians for the gain of patronage As all forms of advertising for gain of patronage have been considered unethical—and other forms such as advertising by radio, cards, posters, magazines, etc., are illegal—it is regrettable that this bill did not make it illegal for

advertising in newspapers also

The Legislative Committee, after studying the three bills that were introduced in this session to permit physicians to practice as partners or in groups to share fees and to contract with a nonprofit medical indemnity or hospital service corporation to practice medicine on its behalf for persons insured under its contracts or policies, was of the opinion that there were grave dangers to the public should these bills be At the meeting of the legislative chairmen of the county medical societies these bills were also unanimously opposed In view of the action by the County Society legislative chairmen and the State Legislative Committee, strong opposition was registered with the Governor even after these bills had passed both houses There was a difference of opinion among the medical profession on these bills and certain groups of the medical profession were supporting them A more lengthy discussion of these bills has been given in the preliminary report and also in the bulletins sent out by the Legislative Committee. Two of these bills—Senate Int 740 and Senate Int 741—were signed by the Governor and became Chapters 722 and 721, respectively (Laws of 1947) The third bill—Senate Int 742—was vected by the Governor Had this bill been around by the Covernor the result of the Senate Int 740. signed by the Governor the prohibition against advertising the practice of medicine would have been removed for those persons constituting a partnership or group of physicians who have an agreement with a nonprofit corporation created under Article 9-C of the Insurance Law to provide medical care for inthere was a great possibility of undesirable advertising developing should this amendment be enacted, and it was gratifying to the Legislative Committee that the Governor vetoed this bill.

that the Governor vetoed this bill.

The Turshen bill—Assembly Int S98—which was reported in the preliminary report, which would have permitted partnerships of physicians maintaning a common office and which was supported by the Legislative Committee and the legislative chairmen of the county medical societies, was not reported out of committee. The same fate befell the Clancibil which defined v-ray diagnosis as the practice of medicine and prohibited any person other than a medical practitioner, dentist, or chiropodist from diagnosing fluoroscopic or registered shadow of any part of the body, or from using v-ray or radium for treating human ailments

The bill which would have permitted the establishment of medical bureaus by a group of employers, and to which the Legislative Committee was opposed, was vetoed by the Governor We were not as successful in our opposition, however, to the bill Assembly Int 2712, which makes valid claim of laboratory or voluntary hospital bureau for services in connection with x-ray examination, diagnosis, or treatment of claimant to workmen's compensation. It is understood that this bill had strong support from the Labor Department and was signed by the Governor and became Chapter 766 of the Laws of

All podiatry, optometry, and physiotherapy bills that were introduced this year either were defeated in committee or were vetoed by the Governor. The very lengthy bill amending the Education Law generally, and which was passed by both houses, has been signed by the Governor and became Chapter 820 of the Laws of 1947. This bill revises the Education Law without substantive change. It is to become effective July 1. Under this amendment the Medical Practice Act, which was formerly Article 48 of the Education Law, becomes Article 131. It now has the title "Medicine, Osteopathy, Physiotherapy" instead of the former title "Practice of Medicine". The sections under this article which were formerly 1250–1266, now become sections 6501–6517.

The Legislative Committee, in submitting this final report, again calls attention to the large number of bills which were introduced in this session of the Legislature which were of primary importance to the medical profession. Although it cannot report that all bills were passed in which we were in favor, nor all defeated to which we were opposed, in a general way the acts by the Legislature this year have been along the lines advocated by the profession and the Legislative Committee

This legislative session has impressed the Legislative Committee of the great need for continual attention to legislative matters both on the part of every member of the profession and every citizen. There has been a gradual change in legislative matters as shown both in the State Legislature and in Congress. Minority pressure groups are having the greatest effect which can only be combated by the interest of the individual voter and his contact with his representatives in these bodies. The legislators themselves would appreciate nothing more than to have this interest shown by their own constituents.

The Legislative Committee will make every effort to keep the members of the State Society informed on legislative matters which are of interest to the medical profession, with the hope that the State Society will continue to occupy its important place as

an adviser to the Legislature and to the Governor on matters pertaining to the public health and the public good

Respectfully submitted, HARRY ARANOW, M D, Chairman Council Committee on Legislation

Section 15 (See 18, 126)

Supplementary Report of the Council Committee— Part X Workmen's Compensation

The Chairman of the Workmen's Compensation Board, under the authority vested in her under Section 13-a and Section 141 of the Workmen's Compensation Law, promulgated the following partial revision of the medical fee schedule, in response to the request of the President of the Medical Society of the State of New York for an increase in the said schedule

The revision includes the first eight items of the proposed schedule covering office, home, and hospital calls, consultation of practicing physician with

specialist

The new schedule shall be applicable to medical care in new cases arising after June 1, 1947, and to old cases reopened and retreated after that date. The discount of 5 per cent heretofore permitted for payment of medical bills of \$15 or over is abolished.

It has been estimated that the revision so far promulgated will include about 60 per cent of all patients treated under the Workmen's Compensa-

tion Law

The remainder of the schedule will receive the attention of the advisory committee appointed by the Chairman of the Workmen's Compensation Board within the next few weeks, and it is hoped a revision upward of the remainder of the schedule

will be announced at an early date

The Chairman of the Workmen's Compensation Board has requested the 23,559 physicians who are authorized to treat compensation cases in this State to give more attention to the prompt filing of reports in order to facilitate the administration of the Workmen's Compensation Law. The department will hereafter more rigidly enforce the rules concerning reporting. Hereafter, if a physician fails to report a case within the time limits prescribed by law, it will be necessary for him to submit with the tardy report a notarized statement giving the reasons for the late filing and asking to be excused from the penalties provided in the Law for failure to report on time

Hereafter, where a patient's complete treatment does not involve more than forty-eight hours' care it will not be necessary to file a C-104 report, but a C-4 report may be filed, and marked "Final," by the

attending physician

Rating M-17—Dr Louis Bauer, President, conferred on May 1, 1947, with Miss Mary Donlon, Chairman of the Workmen's Compensation Board with reference to the rating of M-17 (thoracic sur-

gery) She is not satisfied as to the advisability of setting aside this rating for thoracic surgery. She has requested further data and information from the State Society

Resolutions by County Societies Re Fee Schedule—Recently as the result of action taken by various county medical societies, following the passing of resolutions by Albany County, to the effect that after May 15, 1947, they will submit bills in compensation cases in accordance with the proposed fee schedule, the Chairman of the Workmen's Compensation Board advised the Albany County Medical Society that they had no authority to devise or promulgate a fee schedule, and that the payment of fees by employers and carriers in excess of the minimum, except under extraordinary circumstances, would be unlawful A letter of instructions was issued by Miss Donlon to the insurance carriers informing them that the payment of fees in excess of the minimum, except when extraordinary service was demonstrated, is unlawful

We do not agree with this statement, nor do we

find any warrant in law for such action

Re Rating of Physicians in Employ of State—We have had no opportunity as yet to meet with Miss Donlon and discuss with her the position she has taken in refusing to authorize and qualify physicians in the employ of the State of New York

The Commissioner of Mental Hygiene has expressed his approval of said employed physicians (in the Department of Mental Hygiene) examining

and treating compensation claimants

The position taken by Miss Donlon deprives a number of rural counties in the State of the services of qualified psychiatrists and pathologists, in some of these areas they are the only qualified specialists in these branches

Maurice J Dattelbaum, M D, Chairman David J Kaliski, M D, Director

### NATIONAL MENTAL HEALTH FOUNDA TION

The membership of the National Mental Health Foundation, incorporated one year ago, has grown to nearly 3000 according to a roport issued by Harold Barton, executive secretary on the occasion of the Foundation's first birthday

In the year of its existence the Foundation has reached out into many states to cooperate with dozens of existing mental hygione groups, and church organizations, in a drive to enlighten the public on the proper care and treatment of the mentally ill. It has supplied an impotus to effect legislative reforms for improvement of the administration of state mental health programs and has been instrumental in publicing nationally the evils that exist in state hospitals for the mentally Those cvils were uncovered by a survey which produced the largest body of facts over gathered together on the subject of the nation s treatment of victims of mental disorders.

From a small group of organizational workers a year ago, the Foundation has grown to a staff of thirty full-time workers and a host of volunteers in communities throughout the country. They prepare and distribute educational material designed to interpret the problem of mental health to the layman in such language as to clarify a subject hitherto belogged by obscure professional terminology as well as to change the public attitude toward mental disease from one of dread to understanding and helpful sympathy -Westchester Medical Bulletin June 1947

PHENO BEPADOL FORMULA:

(1821 1902)

proved it in pathology

Virchow's research on leucocytosis leontiasis ossea, and other pathological conditions added much to medical knowledge Although the idea was not original with lum Virchow's experiences with many pathological specimens led to his conception of the cell as the center of pathological change. He believed that every morbid structure con

sisted of cells derived from pre existing cells—a great advance in pathology

E YPERIENCE during the wartime shortage taught smokers the differences in cigarette quality Millions of people amoked more different brands then than they would normally have tried in years More smokers came to prefer Camels as a result of that ex

perience so that today more people are smoking Camels than ever before

But no matter how great the demand we don't tamper with Camel quality Only choice tobaccos, properly aged and blended in the time honored Camelway are used in Camela.

According to a recent Nationwide survey:

### More Doctors Smoke **Camels**

than any other cigarette

# turning point

Following pneumonia influenza and severe gastrointestinal disorders certain patients may exhibit prolonged asthenia traceable to diminished adrenorortical function. When convolescence following such exhausting infections is delayed and the goal of full rehabilitation seems discouragingly distant, a judicious therapeutic test with CORTATE\* is indicated. The use of this most potent electrolyte-regulating her mone of the adrenal cortex frequently becomes the turning point leading to speedy recovery.

# CORTATE

As a therapeutic test CORTATE in oil may be in jected intramuseularly in doces of 2.5 mg daily for several days, or CORTATE in propylene glycol may be prescribed for sublingual administration in doses of 1/10 cc. (10 mg) three times daily

PACKAGING: CORTATE ampuls of 1 cc. containing 3 mg 1 in boxes of 6 and 50 ampuls and vials of 10 cc. containing 56 mg. (5 mg. cc. containing 50 mg. cc. containing 50 mg. cc. containing 10 mg between the property of the pro

### The Accurate

### Measure

### of Activity

Uniformity of response is always directly dependent upon the accuracy of the assay method employed Since THEELIN is chemically pure and free of all nonessential material, it is possible to measure its physiologic potency accurately by weight alone. One international unit of this crystalline substance is defined as 0 0001 mg. Such accuracy is not considered possible in bio-assay tests.

For years THEELIN has been accepted for control of natural or artificial menopausal symptoms, including the associated vasomotor crises and other physical and mental changes characteristic of the female climacteric

THEELIN now available in all strengths, is an accepted specific in relieving menopausal symptoms and sequelae.

Threstin

THEELIN IN OIL—in ampoules of 1 cc, containing 1000 2000 5000 and 10,000 international units.

THEELIN AQUEOUS SUSPENSION—in ampoules of 1 cc. containing 20,000 international units.

...your patient's Assurance of well-rounded

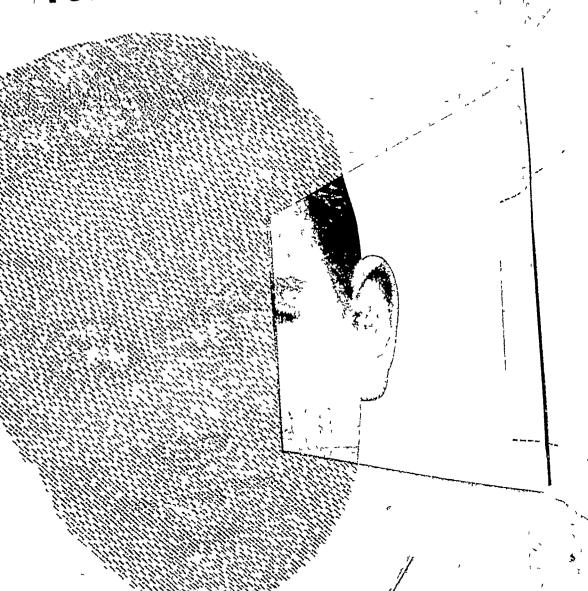

nutrition...

"A loss of the reserve store of nutrients is of the utmost importance to physicians whose patients are apt to be the very ones made vulnerable by loss of these reserves." Such vulnerability may be readily counteracted by the routine use of GERILAC, with its abundance of valuable and easily digestible milk proteins postoperatively in convalescence, restricted diets, and pregnancy and lactation, as well as pediatric and gernatric cases. . Gentlac supplies a high protein and a low fat content with moderate proportions of the milk carbohydrate lactose, and with ample fortification of all essential vitamins and minerals -so necessary for well rounded nutrition. • It is highly palatable when reliquefied either cold or warm-pleasant and bland with or without added flavors-only water required for dilution. It may also be used in cooking and baking

# The medication of choice in TOPICAL CHEMOTHERAPY

of otol

CERTE JUDILIONS. DE

Manufacturers,

Newark 7, N J

# OF OTOLOGIC INFECTIONS

ANALGESIC Prompt effective—without impaired sulfonamide activity

WIDE FIELD Effective in BOTH acute AND chronic otitis media—fungicidal action in otomycotic infection

ADJUNCTIVE A valuable aid to systemic therapy—often reduces need for intensive systemic sulfa medication, thereby averting untoward or toxic reactions

HIGH DIFFUSION Penetrates infected tissues without harmful effects to living tissues

PHYSIOLOGICAL DEBRIDEMENT Promotes drainage and removal of necrotic debris

POTENTIATION Enhanced antibacterial potency

White's Otomide is composed of 5% Sulfanilamide, 10% Urea (Carbamide) and 3% Anhydrous Chlorobutanol in a specially processed glycerin vehicle of unusually high hygroscopic activity. Supplied in dropper bottles of 1/2 fluid ounce (15 cc.)

# tomide TOPICAL OTOLOGIC CHEMOTHERAPY

# A Parkinsonian State Merapy Stramonium Pills Davies, Rose

These pills are engaging increased interest in neurological clinics as well as in private practice, especially in the treatment of the Sequelae of Epidemic Encephalitis. They embrace the full therapeutic properties of the drug in a form convenient for administration

Each pill exhibits 0.16 Gram (2½ grains) of the dried leaf and flowering top of Datura Stramonium, alkaloidally standardized, and therefore contain 0.4 mg (½60 grain) of the alkaloids in each pill

Sample for clinical test and literature mailed upon request.

# .... Follow the ARGYROL Technique ...... in treating Para-nasal Infection

In the recent literature reports are multiplying on the frequency of rebound congestion following use of many vasoconstrictors. This vicious circle of vasoconstriction

and compensatory congestion is avoided with the use of ARGYROL, which produces no such effect, and restoration of normal function is more readily attained

### The ARGYROL Technique

- 1 The nasal meatus by 20 per cent ARGYROL instil lations through the nasolacrimal duct.
- 2. The nasal passages with 10 per cent ARGYPOL solution in drops
- 3 The nasal cavities with 10 per cent ARGYROL by nasal tamponage

### Its 3-Fold Effect

1 Decongests without irri tation to the membrane and without ciliary injury

2 Definitely bacteriostatic yet non toxic to tissue

3 Cleanses and stimulates secretion thereby enhancing Nature's own first line of defense

ARGYROL the Medication of Choice in Irealing Para-nasal Infection

Demerol\* is a synthetic drug used to control severe pain regardless of etiology Demerol is a powerful analyesic and antispasmodic.

### Some Demerol Advantages

- Danger of respiratory depression greatly reduced
- Docs not interfere with cough reflex or cause constipation
- Patients in casts or fixed positions have fewer untoward effects from Demerol
- No "splinting" action on smooth muscle

### In Obstetrics Especially

- Demerol is uncomplicated to administer and supervise
- Safe for mother and child
- Striking absence of fetal anoxia.
  - No weakening of uterine contractions
    - Bad effects on newborn practically nil

Demerol Hydrochloride produces efficacious and gesic and antispasmodic action without the adverse pharmacologic effects of morphine

# (ABBOTT'S VITAMIN B COMPLEX TABLETS)

Each tablet contains: Thiumine Hydrochloride 6 mg Riboflavia . 6 mg Nicotinamide 30 mg Pyridoxine Hydrochloride 1 mg Pantothenic Acid 10 mg (as calcium pantothenate) Liver Concentrate\* 5 grs 21/2 grs Brewer's Yeast, Dried\* \*For other B complex factors

He carefully plans a balanced program, gives no thought whatever to a balanced diet. Irregular hours, lunch counter meals, lack of exercise eventually put him in that growing multitude of borderline vitamin deficiency cases

the chronic dieters, food faddists, excessive smokers, alcoholics, persons too busy or too tired to eat properly Deficiencies of the vitamin B complex are common in such cases. In addition to instituting a corrective diet, more and more physicians are prescribing Sur-bex as an effective supplement Sur-bex is a high potency vitamin B complex tablet containing therapeutic amounts of five B complex factors, with liver concentrate and dried brewer's yeast added for other B complex factors. The tablets have a special double coating which seals in the odor of the liver concentrate and provides a pleasing orange bouquet and flavor. Sur bex is available at prescription pharmacies everywhere in bottles containing 100, 500 or 1,000 tablets

The plus" is the gratifying "sense of well being so many menopousal patients experience following "Premarin therapy it is the intangible factor which, added to relief of distressing symptoms, enables the middle aged woman to resume her normal routine of useful and enloyable activities

Premarin provides naturally occurring conjugated estrogens for effective ther apy by the oral route. Untoward side effects are rarely noted with Premarin

Premarin is now available as follows:

Tablets of 2.5 mg. In bottles of 20 and 100
Tablets of 1.25 mg In bottles of 20 100 and 1000
Tablets of 0.625 mg In bottles of 100 and 1000
Iquid containing 0.625 mg per 4 cc. (one teaspoonful) In bottles of 120 cc.

While sodium estrone suitate is the principal estrogen in Premarin, other equine estrogens estradiol, equiline, equine, hipputh are also present as water soleble suitates. The water soleblity of confugated estrogens (equine) permits ropid obsorption from the postrointestinal tract.

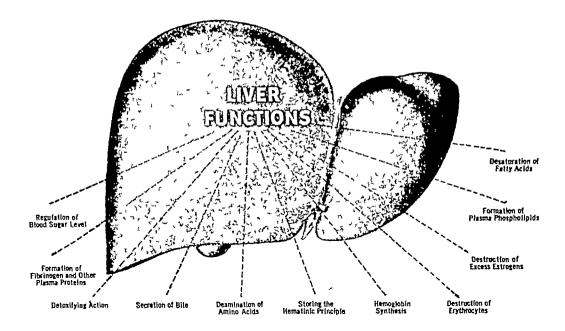

CONJUGATED ESTROGENS

# To Guard the Functional Integrity of the LIVEIR

The complex nature of the manifold functions of the liver is reflected in the diagram shown above. To maintain its functions in an efficient manner, the liver must be adequately protected against toxic influences. Parenchymatous damage with ensuing decreased functional capacity can lead to severe metabolic derangements.

Protein deficiency is an important factor in precipitating impaired liver function. Hence an adequate intake of biologically complete protein, ordinarily in the form of protein foods, is indispensable as a safeguard of liver competency.

Among man's protein foods, meat ranks high not only because of its generous content of protein, but also because its protein is complete, capable of satisfying all protein requirements. Furthermore, all meat is 96 to 98 per cent digestible

# cyclic security

# A FUNDAMENTAL PATTERN IN MENSTRUAL DISTURBANCES

A fundamental plan of therapy in hypo ovarian function may be based on the dominating role of the anterior pituitary gonadotropins. A rational approach to successful control of menstrual disturbances may be the stimulation of normal ovarian function and activity by the use of true anterior pituitary gonadotropic hormone following preliminary preparation with cyclic estrogens and progesterone to correct the immediate deficiency of ovarian chemicals.

## GONATROPE (Forbes)

Thus cyclic security depends upon ovarian stimulation and maintenance of the normal menstrual cycle GONATROPE (Forbes) may be specifically applied as a natural stimulative therapy to hypo ovarian function as the product is a true pituitary gonadotropic hormone extracted from the anterior lobe of equine pituitary glands and contains both fallicle-stimulating and lutemizing principles GONATROPE (Forbes) following preliminary preparation should induce a natural estrus cycle with a prompt and lasting response in the majority of the cases

DO YOU KNOW WHAT THESE SYMBOLS STAND FOR?

REXALL FOR RELIABILITY

For centuries the owl has symbolized great knowledge and superior wisdom "Wise as an owl" was a quip of Caesar's time The canny bird was sacred to Minerva, Roman goddess of learning and of science The natural assumption was that the owl acquired wisdom from his patroness

For many years, the familiar Rexall symbol has denoted excellent standards of pharmaceutical science From coast to coast more than 10,000 selected, independent pharmacies display this sign It assures you that fine, laboratory-tested Rexall drug products and skilled pharmacists are at your service

# What Your Taxes Buy in Washington I Federal Health Workshops<sup>1</sup>

Physicians in New York State to whom we address these greetings will be provoked, and we hope angered, but will not be surprised to learn about "Federal Health Workshops"

Our authority is House Report No 786, 80th Congress, First Session, submitted to the Committee of the Whole House on the State of the Union July 2, 1947 This is the Third Intermediate Report of the Subcommittee of the Committee on Expenditures in the Executive Departments Authorized to Investigate Publicity and Propaganda of Federal Officials in Formation and Operation of Health Workshops.

First, what are "Federal Health Workshops?" They are, in effect, Federal propaganda agencies, if we read pages 2 and 3 of the report correctly There have been two of them St Paul, Minnesota, February 6 to 10, 1946, Jamestown, North Dakota, September 27 to 30, 1946 The first was attended by "80 persons, 15 of whom were

Government employees, representing 7 different agencies in the Federal establishment." The second was attended by "98 persons , 18 of whom were Federal employees, representing 7 Federal agencies. The chairman of this meeting was Mayhew Derryberry, Ph.D., of the United States Public Health Service Apart from Federal personnel, there were no doctors of medicine in attendance at this meeting as delegates. The testimony before your committee indicated that no registered doctor of medicine was invited to participate"

This could have been oversight and not a deliberately planned discourtesy to the tax-paying, registered doctors of medicine Three "meetings in furtherance of these health workshops" had been previously held, the first in Washington, D.C., November 2, 1945, the second in Chicago, November 26 to 27, 1945 the third in Washington, D.C., December 10, 1945. The purpose of these three planning meetings was to create a Federal propaganda and publicity device,

I This is the first of a series of editori is on this subject.

the "health workshop," which in the words of the investigating committee was calculated to build up an artificial, federally stimulated public demand upon Congress for enactment of legislation for compulsory health insurance referred to by witnesses and publications as the Wagner-Murray-Dingell bill"

All the evidence before your committee indicates that these health workshops were planned, conducted, and largely financed with Federal funds, by a key group on the Government pay roll, who used the workshop method of discussion subtly to generate public sentiment in behalf of what certain witnesses and authors of propaganda refer to as socialized medicine It is evident from the record that most of the planning was done by the Federal officials in Washington prior to each workshop conference and that each meeting was devoted to their own purposes—that of organizing pressure groups to agitate for compulsory health insurance, as then pending in Congress

In preparation for the Jamestown Health Workshop, the Public Health Service distributed in advance to all invited delegates a packet of pamphlets published by the CIO, AF of L. the Physicians' Forum (a propaganda agency for the Wagner-Murray-Dingell bill), and the Government bureaus, in support of what certain witnesses and authors of propaganda refer to as socialized medicine These packets were mailed to the delegates in advance of the conference, at Federal expense They urged that letters be written to Senators and Representatives, advocating immediate action on the Wagner-Murray-Dingell bill

After the propaganda packets had been delivered, well in advance to the invited delegates, The Jamestown Health Workshop assembled on September 27

Details of the meeting of September 27 need not be given here. The purpose of the "training program" was to indoctrinate "a hand-picked group of leaders from the various local societies" in workshop procedure. This training program was handled entirely by the employees of the Federal Govern-

ment The investigating committee says, basing its reasons on the account of the meeting

Testimony demonstrating the efficacy of this indoctrination of delegates by the Federal officials was found in the formal summary of the Jamestown Workshop, as presented by the United States Public Health Service

One section of the "action program," approved by the conference, urged that congressional candidates and incumbents be polled by the committee, on their stand on the national health program, and that their opinions be sent to the State organizations for publication

In the opinion of your committee, this recital presents the complete picture of Government propaganda in action. The Federal employees arrange the meeting, invite the delegates, train the delegates, preside at the meetings, and then frame the formal summary of resolutions and actions.

And all of this is paid for with public moneys never authorized or approved by Congress for these or any like purposes

Enough of the report has been here quoted to convey to our readers the odor of improper activities of Federal agencies in propagandizing compulsory health insurance in 1946, under the subterfuge of "health workshops" The agencies "known to have participated in this campaign are The United States Public Health Service, The Children's Bureau, The Office of Education, The United States Employment Service, The Department of Agriculture, Bureau of Research and Statistics in the Social Security Board"

The registered doctors of medicine in the State of New York will not overwhelmingly approve of the diversion of their tax dollars as well as those of their patients to the underhanded, sly, not to say illegal, purpose of creating, sustaining, and propagating support for compulsory health insurance or "what certain witnesses and authors of propaganda refer to as socialized medicine"

# The Successful Approach

We are very fond of the medical profession and we want to see it get ahead — It may be useful from time to time to point out some of the reasons why it doesn't

A doctor has been defined as "a man who

finds out what you like to do and then tells you not to do it"

The converse of the proposition is equally true

In no field that we can think of has the

profession been more conspicuously unsuc cessful than in the treatment of poor posture in patients of all ages—the dumpy child, the awkward adolescent, the self indulgent adult of either sex who for one reason or another is unsightly, slightly obese, and difficult to be with

Why?

Because in dealing with such cases the doctor doesn't know How, and he doesn't know Why

"Physician, heal thyself'

If you want your child to stand up straight, set him an example Don't tell him to throw his shoulders back. Pull your own tail down, suck up your guts, and let your head go up where it belongs.

If you have a dumpy child, enquire into the problem of his endocrines and don't mention glandular disturbances in front of him

If you have a gangling adolescent make very sure there is no physical basis for the awkwardness. Weak feet, osteochondritis deformans juvenilis, or what have you

In the case of adults verging on obesity, be sure that their background was not—or is not—one in which "they never knew where their next bite was coming from" Obesity and alchohol are very closely related as compensations for insecurity

But after you have done all these things you will notice that everything involves either taking away from your patient something he likes, or trying to force him into doing something that he doesn't like

Now read the following blurb and mark how the same problems may be resolved commercially by a difference in the method of approach.

The patient who attempts to achieve weight reduction solely under a prescribed regime is often thereby conditioned to regard her obesity as a disease and the required routine of treatment as something unpleasant which has been forced upon her. She has a sense of abnormality and of

trying to do something alone. On the other hand, the patient who enrolls in the DuBarry Success Course is given the feeling that she is one of a group of thousands of women who have successfully reduced their weight and increased their personal attractiveness by doing exactly what she is doing The routine of treatment thus becomes a game at which she works hard because the ultimate goal is presented to her, not from a purely medical point of view, but from the more glamorous and appealing one of personal The obese woman usually has a feeling of inferiority because of her appearance against the background of her own group she feels isolated and develops a depression often bordering upon a psycho-neurosis and the attitude that improvement is hopeless coupled with her original weakness of will power causes her to fail to adhere to treatment she can be made to realize that she is one of many women who are overweight and who are successfully improving their appearance she thereby acquires the necessary incentive for cooperation

Smart advertising writing? Certainly A masterpiece This method gets results and the other sometimes doesn t And what, pray, are we physicians interested in? The welfare of our patients.

We present these ideas to the voung, intel ligent, enthusiastic, physically fit, idealistic, and inexperienced members of our Woman's Auxiliary

Shane Leslie once said that "the idea of the Church of England was to provide a resident gentleman for every parish in Iroland, and there have been worse ideas"

We suggest the possibility of a charm school for every town in the State of New York A school run by doctors of medicine who know why, by teachers who know how, and attended by pupils who want what they are going to get.

### Current Editorial Comment

The New Commissioner of Health Dr Herman E Hilleboe, formerly assistant surgeon general and associate chief of the Bureau of State Services of the United States Public Health Service, has been appointed commissioner of the New York State Department of Health by Governor Thomas E. Dewey <sup>1</sup>

<sup>&</sup>lt;sup>1</sup> A New and Psychological Approach to Weight Adjustment and Improvement of the Feminine Face and Figure. The Dubarry Success Course, page 16 Distribut n of this publication is stated to be excludively to the medical profession.

<sup>1</sup> Health News, Vol 24 Np. 27 July 7 1947

Dr Hilleboe's appointment became effective July 1, 1947 Shortly after he assumes his new office he will leave for a three-week tour of Europe where he will study health and tuber-culosis problems and attend three international health meetings

Dr Hilleboe was born in West Hope, North Dakota, January 8, 1906, and received his elementary school and high school training in He received the degrees, Bachelor Minnesota of Science and Bachelor of Medicine, at the University of Minnesota in 1929 He received the degree of Doctor of Medicine from the University of Minnesota Medical School in He had graduate training in pediatrics at the University of Minnesota Hospitals at He had graduate training in Minneapolis public health at the Johns Hopkins School of Hygiene and Public Health and received the degree of Master of Public Health from that school in 1935

After graduation from medical school, Dr Hilleboe engaged in rural general practice in Swanville, Minnesota Since 1935 he has spent full time in public health work specializing in tuberculosis control. In June, 1939, he was appointed as a senior assistant surgeon in the regular corps of the Public Health Service Early in 1939, he made special studies for the Public Health Service in tuberculosis control in the Scandinavian countries, England, Germany and France

Dr Hilleboe served with the Minnesota Division of Social Welfare in St. Paul, Minnesota, as chief of the Medical Unit from 1939 to 1942, on loan from the Public Health Service. Since 1942 he has been in charge of tuberculosis control activities in the Public Health Service in Washington, D.C. On July 1, 1944, he was appointed chief of the Tuberculosis Control Division of the Public Health Service with the rank of medical director. On November 1, 1946, he was appointed associate chief of the Bureau of State Services of the United States Public Health Service with the rank of assistant surgeon general.

Dr Hilleboe is a member of the Board of Directors of the National Tuberculosis Association, member of the Council of the American Trudeau Society, and member of the Board of Regents of the American College of Chest Physicians. He also is professorial lecturer in Tuberculosis at the George Washington University Medical School, Washington, D.C., and adjunct professor of medicine, Georgetown University

Dr Hilleboe was appointed by the National Tuberculosis Association on March 10, 1947, as a representative on the Council of the International Union Against Tuberculosis On May 31, 1947, he was appointed as the American member of the Expert Committee on Tuberculosis of the World Health Organization, Interim Commission

Dr Hilleboe surely comes with a wealth of experience to his present appointment. The Journal extends to him on behalf of the Medical Society of the State of New York a hearty welcome

School-Age Population Increases The educational system of the country, recently subjected to critical examination by reason of the teachers' strikes, seems to be due for a tidal wave of new business Says the Statistical Bulletin 1

As a result of the war and the postwar boom in births, our country will have a record number of children at the school ages in the 1950's In fact, more than 5,000,000 children will probably be added to the elementary school population of our country within the next decade

The number of children in the United States eligible to begin their formal education—the 6-year-olds—has been increasing slowly in recent years and now totals nearly 2,500,000 Their numbers will grow to almost 2,900,000 two years hence—In 1950 and in 1951, however, the new contingents of 6-year-olds will fall off somewhat—reflecting the decline in the birth rate in 1944 and 1945—but they will then resume their increase until they number nearly 3,300,000 in 1953—The latter figure is 40 per cent higher than that for 1945

The situation urgently calls for planning along practical lines in order that sufficient provision be made for the education of these This should include provision for child health guidance and, we hope, the rudiments, at least, of a program of health teaching in the public school system Such a program syllabus was, in recent years, the subject of much work and collaboration between the State Department of Education, the State Department of Health and the Council Committee on Public Health and Education of the Medical Society of the State of New York Apparently nothing has happened recently to advance this program Is the new flood of children to be as neglected in this respect as were their predecessors? # THE INFLUENCE OF STILBAMIDINE UPON KIDNEY FUNCTION, LIVER FUNCTION, AND PERIPHERAL BLOOD IN MULTIPLE MYELOMA

Neurologic Sequelae of Stilbamidine Therapy

H ARAI, MD, and I SNAPPER MD, New York City

(From the Second Medical Service of the Mount Sinai Hospital)

IN PREVIOUS papers by Snapper, and by Snapper and Schneld' clinical observations and bone-marrow studies of multiple myeloma patients treated with still bamidine were presented. It was pointed out that stilbamidine abolished the pains of many patients with multiple myeloma and temporarily arrested but did not cure the disease relapses were frequent and the fatality rate remained high It was reported also that stilbamidine caused morphologic changes in the myeloma cells, consisting of the appearance of basophilic cytoplasmic granules which contain ribose nucleic acid and stilbamidine ent paper deals with the influence of stilbamidine upon kidney function, liver function and peripheral blood Special attention is given to the peculiar neurologic phenomena which develop after consation of treatment.

### Influence upon Kidney and Liver Function

It has been conclusively demonstrated in experimental animals that stillbamidine and other aromatic diamidines can produce renal and hepatic damage Devine\* in 1940 found that injec tion of sublethal doses of undecane diamidine and stilbamidine in rabbits gave rise to blood changes indicative of renal damage These changes developed prior to and independently of hepatic Daubney and Hudson<sup>2</sup> in 1941 reported delayed poisoning in cattle infected with trypanosomiasis and treated with large doses of pentamidine Extensive fatty degeneration of the liver was found and hypoglycemia appeared almost simultaneously with the onset of hepatic injury Hawking and Smiles' in 1941 observed that stilbamidine injected into mice infected with trypanosomes was absorbed not only by the trypanosomes but also was deposited in the liver kidneys and skin, and excreted in the urme

Wien, Freeman, and Scotcher\* in 1943 reported that in laboratory animals small or therapoutic doses caused no change in the blood sugar level Only when toxic or lethal doses were given were appreciable glycemic responses obtained consisting of initial hyperglycemia followed by terminal hypoglycemia. The glycemic responses were due chiefly to direct toxic action upon the parenchy matous cells of the liver and this led to depletion of glycogen reserves Doses which had no effect upon the blood sugar level produced an increase in blood urea nitrogen and nonprotein nitrogen thus substantiating the aforementioned work of Devine who showed that the renal damage occurs before and independently of hepatic damage The finding of extensive fatty degeneration of the liver after lethal doses of stilbamidine confirmed the conclusion of Daubney and Hudson that the most significant pathologic change produced by diamidines is found in the liver Kirk and Henry stated that in experimental animals, poisoned by a single lethal dose or by repeated toxic doses of stilbamidine the pathologic changes in the kidney are more constant and characteristic than those in the liver. The lesions consist of severe con gestion with focal areas of hemorrhage in the medulla and in the intermediate sone associated with tubular degeneration varying from simple cloudy swelling to necrosis and desquamation The same authors observed focal and diffuse fatty degeneration of the liver. In no instance did they find acute vellow atrophy or comparable

Delayed tone effects on the liver kidney, and nervous system of human patients with kala-axar were found only in cases treated with stilbamdine which had not been freshly dissolved Fulton and Yorke Barber Slack, and Wien Fulton, and Henry! reported that stilbamdine solutions exposed to light rapidly undergo chemical changes with resulting increase in toxicity not only to experimental animals, but also to humans. During the war, due to the closure of the Mediter

Presented before the 141st Annual Meeting of the Medical Society of the State of New York General Scenions, M y 9 1047

ranean Sea, stilbamidine was flown from England in prepared bottled solutions These solutions became toxic during transportation, this may well explain the cases of stilbamidine poisoning which were published from Africa during the war Kirk and Henry<sup>6</sup> in 1944 confirmed the increased toxicity of old solutions Cumulative action played little or no part in the delayed toxic effects These authors collected autopsy findings in ten human cases of kala-azar treated with old bottled solutions of stilbamidine Their conclu-"No very satisfactory conclusion on sions were this point (delayed toxic effects) can be reached from the pathologic findings in this series Varying degrees of renal and hepatic injury have been found, but the pathology was, in most cases, greatly influenced by the disease, and there are unfortunately big gaps in the material which was available for examination It would be exceedingly difficult to define with certainty the parts played in the causation of the lesions by the drug, or the disease, or extraneous factors such as diet. or intercurrent infections, including infective hepatitis which was prevalent in the Sudan at the time"

No record exists of delayed poisoning following the use of freshly prepared stilbamidine solutions Kirk and Sati11 treated a series of 43 cases of

kala-azar with three different aromatic diamidines, including freshly prepared stilbamidine solutions, and found no instance of delayed toxic effects after intervals as long as two and onehalf to three years Sen Gupta<sup>12</sup> treated a large series of cases of kala-azar with freshly prepared solutions of stilbamidine and found no instance of delayed toxic effect upon the kidney or liver

### Personal Observations

We studied kidney and liver function in 26 myeloma patients during and after stilbamidine We are presenting the results on 16 patients treated until January, 1947 shows the data obtained in 14 of these patients The data obtained in 2 other patients who showed signs of renal failure after the termination of stilbamidine treatment are displayed in Table 2 patients 150 mg of freshly prepared stilbamidine solution was given either intravenously or intramuscularly, either daily or every second day total dose varied from 1.950 mg to 6,475 mg effect of the drug on renal function was studied by the determination of blood urea nitrogen, nonprotein nitrogen, and creatinine in the serum, and by the urine concentration test and the phenolsulfonphthalein excretion test The effect on the liver was studied by the cephalin flocculation test, thymol turbidity test, icterus index, bilirubin, serum cholesterol, and serum cholesterol esters, and in some cases

Died in uremia on March 4 1047 Autopsy myeloma kidneys

by hippuric acid excretion and glucuronic acid excretion (Snapper Greenspon and Saltzman) 13 14

In 14 cases there were no significant changes suggestive of impairment in ronal and bepatic function
during or after treatment. Case 13 serves to illustrate that massive doses of freshly prepared stillamidline can be given with impunity. This patient
received periodic courses of stillbamidine for twenty
two months without demonstrable effect on the
kidney or liver.

As for the possible influence of stilbamidine upon renal function, it may be important to note that in Cases 3 6 and 7 the scrum creatinine had increased slightly at the time the stilbamidine treatment was terminated In all three cases the creatinine values subsequently returned to normal. Among the 14 patients collected in Table I there were three deaths (Cases 1 2 and 6) during and after stilbamidine therapy In all three nitrogen retention was present before death which however, could be explained by the underlying disease. At autopsy none of the three cases revealed evidence of stillbamidine intoxi-Case I had impaired renal function with moderate exerction of Bence-Jones protein in the urine before the institution of therapy histopathologic study of the kidneys revealed mycloma kidneys, a frequent cause of renal insufficiency Case 2 on admission to the hospital had a cord bladder due to injury of the spinal cord following collapse of the vertebrae destroyed by myeloma throughout the treatment and up to the time of death it was necessary to maintain continuous tidal drainage. This patient developed urea retention shortly before death, six months after the stilbamidine treatment had been terminated. Study of the kidneys of this case revealed chronic pyelonephritis and nephroscierosis a common finding in such patients. Case 6 was a diabetic patient whose diabetes mellitus was well controlled throughout the treatment. During the stilbanddne treatment no change in renal function was observed. A follow up examination thirty two days after termination of the treatment also showed normal values for the nonprotein nitrogen and creatinine of the blood. Seven weeks after the last injection of stilbandine the patient was read mitted with severe diabetic ketosis and nitrogen retention, and expired in a few days. The kidneys showed advanced arterial and arteriolar sclerosis. Thus none of these 3 cases showed renal changes comparable with the lesions observed in animals poisoned with stilbandine.

This even held true in the two following patients in whom stilbamidine acted unfavorably on renal function (Table 2) The first patient, who suffered from extensive multiple myeloma, had been found in another hospital to show considerable Bence-Jones proteinuria and also hypercalcemia. At that time the nonprotein nitrogen had been found to be 35 mg per cent that is within the upper limits of normal After the patient's admission to the Mount Sinai Hospital the presence of Bence-Jones proteinuria was confirmed. The urea nitrogen of the blood was found to be 16 mg per cent, the uric acid 5 2 mg per cent. During the time of observation the hypercalcomia varied between 12 and 16 mg per cent. On a Bauer Aub diet a significantly increased calcium excretion was found, varying between 355 and 399 mg perday

Stilbamidine injections were given every other day between February 12 and March 14 1946 totaling 21 Gm. On the day after the last injection (March 15 1946) the patient was nauscated The blood urea nitrogen had then increased to 44 mg per cent, the nonprotein nitrogen to 75 mg per cent. Intravenous infusions of glucose were given. The urea nitrogen gradually decreased and reached 20 mg per cent on April 6. The patient died suddenly on April 11, 1946. At autopsy only myeloma kidneys were found. In this case the combination of Bence-Jones proteinuria and hypercalcemia must have led to deterioration of the renal function. Renal failure was evidently precipitated by the stilbamidine.

The second patient was a man, 74 years old, who was admitted to another hospital in October, 1946 Here Bence-Jones proteinuria was found, and the diagnosis of multiple myeloma was confirmed by sternal marrow puncture. At that time the urea

nitrogen was found to be 19 mg per cent

At admission to the Mount Sinai Hospital the blood urea nitrogen was already increased to 26 mg per cent before stilbamidine treatment was started on December 31, 1946 On January 3, 1947, the phenolsulfonphthalem excretion appeared to be unsatisfactory (20 per cent) This test was repeated eight days later and an excretion of 25 per cent was On January 10, the blood creatinine was 3 02 mg per cent However, when on January 16 the blood urea mitrogen was reported as 11 mg per cent, there seemed to be no special reason for con-The patient received thirteen injections of stilbamidine, totaling 2 1 Gm. By January 22, the day after the treatment was terminated, the blood urea nitrogen had risen to 50 mg per cent, the creatimine to 48 mg per cent Intravenous infusions of glucose were given but when the patient left the hospital on January 31 the urea nitrogen was still 44 mg per cent, the nonprotein nitrogen 60 mg per cent, and the creatinine 49 mg per cent turned on March 1, 1947, in a desperate condition The blood urea mitrogen was then 130 mg per cent. the creatanine 72 mg per cent, and he died a few days later

At autopsy typical myeloma kidneys were found In this patient the combination of myeloma kidneys and advanced age may well have been the mun factors in the deterioration of renal function during the stilbamidine treatment

In the ten patients treated since January, 1947, and not mentioned in Tables 1 and 2 no untoward reactions were noted

Liver function tests performed during and after stilbamidine treatment yielded normal values Apart from the tests mentioned in Tables 1 and 2, hippuric acid tests were performed in Cases 7, 9, 11, 12, and 13 after the stilbamidine treatment had been completed. The results were normal. In none of the 5 patients who came to autopsy were signs of liver degeneration found, the same was true of the 2 patients who developed signs of uremia during the treatment.

# Influence Upon the Peripheral Blood Picture

Wien, Freeman, and Scotcher<sup>5</sup> studied the effect of the diamidines, stilbamidine and propamidine, on the peripheral blood picture of guinea pigs. They gave repeated injections of toxic

doses and found no significant changes Our review of the literature reveals no report of hematologic complications during the treatment of human kala-azar with aromatic diamidines. In multiple myeloma treated with stilbamidine, this problem is of considerable importance because most myeloma patients show signs of myel ophthisic anemia often accompanied by thrombocytopenia. Our studies are presented in Table 3

Several noteworthy changes were observed Case 15 developed marked eosinophilia during two subsequent treatments. It is probable that this was due to stilbamidine since the eosinophila reappeared when the treatment was repeated In other patients no marked eosinophilia occurred during the treatment Both eosinophilia and lymphocytosis are known to occur in multiple myeloma, 15 eosinophilia existed in Cases 5 and 6 before the institution of therapy Case 3 had a platelet count of 150,000 before treatment After treatment it fell to 70,000 and eventually rose to 160,000 In all the other cases the platelet count was not influenced Even in cases with thrombopenia,16 the number of platelets did not drop progressively during or after treatment. It is important to note the absence of leukopenia during stilbamidine treatment The leukopenia observed in Case 15 during the later phase of treatment developed only after periodic courses of radiotherapy had been started. There were no significant changes in the hemoglobin and red cell levels other than what may be expected in the natural course of this disease The patients treated with stilbamidine, like all myeloma patients, needed occasional blood transfusions

Thus it appears that still amidine even in the large doses given in this series has no effect upon the hemopoletic system

# The Effect on the Nervous System

Napier and Sen Gupta<sup>17</sup> in 1942 reported 7 cases with subjective disturbances and dissociated anesthesia over the areas supplied by the sensory branches of the trigeminal nerve, developing a few months after cessation of stilbamidine therapy. They described this condition as diamidine-stilbene neuropathy. This delayed toxic effect of freshly prepared stilbamidine has been confirmed by Sen Gupta<sup>12</sup> in 1943 and by Kirk and Henry<sup>6</sup> in 1944.

Diamidino-stilbene neuropathy is reported to occur between two and a half and five months after cessation of therapy. It is characterized by numbness, formication, heaviness, and itching There is dissociated anesthesia over the areas supplied by the sensory branches of the trigeminal nerve the sensation of light touch is lost but the sensations of pain, temperature, and pressure are intact. These peculiar features distinguish this

neuropathy from the known neuropathies of the trigeminal neuropath, peripheral neuropath, and interstitial neuritis. Subjective and objective disturbances involving the trigeminal nerve do not occur in kala-axar un treated or treated with different antimony compounds.

It is now believed that diamidino-stilbene neuropathy is due to toxic degeneration of the principal sensory nucleus of the trigeminal nerve. The selective action of stilbamidine upon this site may well be due to the ethylene component of this drug. After experimental stilbamidine intoxication in dogs, thrombosis, perivascular hemorrhage and infiltration, neuronal degeneration and myelin disintegration have been observed.

Sen Gupta<sup>12</sup> observed 17 cases of diamidinostilbene neuropathy among 104 cases of kala-axar treated with freshly prepared stilbamidine. The incidence would have been higher if all the cases could have been followed for a sufficient length of Each of the 104 cases was treated with 1 mg. of stilbamidine per pound of body weight, and the number of injections varied from nine to fifteen. Immediate reactions after the injections (hypotension tingling in the face flushes) occurred as commonly among those not developing the neuropathy as in those who did. Hence, Sen Gunta concluded that dosage was not responsible for the delayed toxic effect and that immediate toxic reactions are no indications of susceptibility to subsequent neuropathy In most of the 17 cases the symptoms appeared between the third and fourth month after cossation of therapy The principal subjective symptoms were paresthesis and anosthesia limited to the forehead and face in all cases except one in whom they spread Five patients complained of itching inside the eyes and ears, 2 of twitching of the facial muscles, and in 3 patients there was blinking of the These signs were due perhaps to irritation of the neurones of the nucleus of the facial nerve which he close to the principal sensory nucleus of the trigeminal nerve In 3 cases there was analgesia of smaller areas within the larger areas of dissociated anesthesia, indicative of probable extension of the lesion, caudad over the spinal tract of the fifth nerve and its nucleus There were slight troplic changes of the skin in 4 cases, probably due to rubbing and There was a gradual subsidence of the paresthetic symptoms but no change in the objective dissociated anesthesia during observation extending as long as twenty-two months A variety of agents including vitamin B, were used in an effort to relieve the symptoms. Only cobra venom solution (1 100,-000) in gradually decreasing doses proved to be of some value Sen Gupta<sup>12</sup> states "The neuropathy is apparently not dangerous to life, it mercly causes rather unpleasant symptoms to some of the patients In most cases it does not show any sign of extension, and the tendency (of the neuropathy) is to a very slow recovery "

We were able to follow 18 patients for more than two months after the stilbamidine course was terminated Of these 18 cases, 10 developed diamidinostilbene neuropathy, as explained in Table 4

The onset of the symptoms varied from one to one and a half months in Case 7, and in Case 18, to five months in Case 4 after the cessation of therapy

In the majority of the cases the interval was two to three months The number of injections varied from fourteen in Case 6 to forty-five in Case 7, and the total dosage from 2,100 mg in Case 6 to 6,750 mg in Case 7 Most of the patients who did not develop the neuropathy were observed for only two to three months after the end of therapy However. I patient observed for twenty-five months never developed the dissociated anesthesia. In all the cases immediate toxic reactions were observed at one time or another during therapy, the reactions varied from slight flushing and tingling of the face in Case 7 to sudden fall in blood pressure, and nausea and vomiting in Cases 1 and 2 In all the cases, dissociated anesthesia over the areas supplied by the sensory branches of the trigeminal nerve was present. and in Cases 2 and 6 there was extension to the neck

The paresthetic symptoms were mild except in Case 2, whose symptoms were unusual, for which reason the case will be discussed in some detail This patient was a 44-year-old white woman with multiple myeloma who received 23 injections of stilbamidine or a total dose of 3,450 mg Three and a half months after the last injection, she awoke one night with sensations of numbness, tingling, and heaviness in and around the nose Gradually these symptoms spread to the forehead, which began to feel as "heavy as a stone" Gradually the cheeks and the neck became involved, finally even the conchae of the ears During the fourth month, after the last injection, intense itching of the external canthus of both eyes and corners of the mouth developed The symptoms over the forehead, face, and neck gradually became less intense, but the itching became more severe and led to uncontrollable rubbing of the eyes. Six months after the end of stilbamidine therapy, it became necessary to readmit this woman in order to treat the bilateral conjunctivities and blepharitis which had developed be cause of constant rubbing. After the use of a soothing ophthalmic ointment supplemented later by vitamin B<sub>1</sub> injections and by benadryl, the symptoms and inflammation gradually subsided

In all the cases there was gradual subsidence of the symptoms Dissociated anesthesia, however, often remained with neither extension nor regression. It it noteworthy that Case 1 of Table 4 also showed no further extension of the symptoms and signs despite resumption of stilbamidine injections after the development of the neuropathy. The same held true in Case 2.

# Discussion

Although there is experimental evidence that stilbamidine produces renal and hepatic damage, the literature gives no conclusive evidence of renal and hepatic damage in human cases of kala-azar treated with freshly prepared stilbamidine solutions. In our cases of multiple myeloma, freshly prepared stilbamidine solutions also were employed. In 5 patients who came to autopsy postmortem studies revealed no evidence of stilbamidine damage to the liver. In none of our patients did we observe biochemic changes suggestive of immediate or delayed toxic effect upon the liver although the dosage used in multiple myeloma was several times larger than the dosage used in kala-azar.

However, the influence of stilbamidine on the kidney function of myeloma patients must be watched carefully In all patients with Bence-Jones proteinuma, there is danger of uremia due to myeloma kidney The experiences reported here seem to indicate that stilbamidine may occasionally precipitate renal failure in patients with imminent uremia due to myeloma kidney such patients have been encountered among 26 patients treated In both patients Bence-Jones proteinuma evisted In the first patient hypercalcenna, in the second patient old age may well have been additional predisposing factors in these two patients the autopsy only revealed the presence of myeloma kidneys without the lesions which have been described in animals as sequelae of stilbamidine poisoning In 3 other patients with multiple myeloma who came to autopsy such renal lesions were absent

It is necessary to make a careful study of renal function before the treatment with stilbamidine is

<sup>\*</sup> The postmortem findings of these cases will be reported in detail in a future communication

initiated The urea introgen, nonprotein nitrogen creatinine, and uric acid content of the blood must be determined. The phenolalionphthalein test and the concentration test must be performed. During the treatment weekly blood urea nitrogen determinations are necessary.

The danger to renal function should not be exaggerated. The two untoward results reported were the only ones among 20 patients with multiple mycloma, 17 of whom showed Bence-Jones proteinuma. Other patients not mentioned in thus review had elear-cut impagment of

renal function before the inception of stilbamidine treatment but did not develop uramia during the administration of the drug. It is true that in such cases stilbamidine was given at longer in tervals than usual often only twice per week.

After stilbamidne treatment of multiple myeloma there were no serious changes in the peripheral blood which could be ascribed to the drug One patient developed cosmophilia. It is evident thus that multiple myeloma patients with myelophthiac anemia and thrombocytopenia can be treated with no fear of aggravation by the drug

The neurologic sequelae peculiar to stilbamidine therapy occurred in 10 out of 18 patients who could be observed for more than two months after termination of the injections Gupta's series,12 the incidence was 17 out of 104 cases, although this author agrees that the incidence would have been higher if he could have fol-The higher incidence in our lowed more cases series well may be explained by the higher dosage Whereas in Sen Gupta's series the total dose given varied from 575 mg to 1,660 mg, in our series the range was from 2,100 mg to 6,750 mg was well illustrated by Case 18, who for four months had no neurologic signs after 1,200 mg of stilbamidine had been given but who developed the characteristic neuropathy one month after a second series of 1,500 mg of stilbamidine had been administered

The neuropathy observed in our cases of multiple myeloma was typical and was characterized by subjective symptoms which subsided gradually and spontaneously. The objective dissociated anesthesia tended to persist for a long time with no extension beyond the neck even when stilbamidine injections were resumed after the neuropathy had developed. The neuropathy did not endanger life.

# Summary

Repeated injections of stilbamidine dissolved immediately before use have no delayed toric effect on the liver or hemopoietic system of persons suffering from multiple myeloma. The development of renal insufficiency in some myeloma patients during or following stilbamidine therapy is due to exacerbation of a pre-existing renal insufficiency caused by myeloma kidneys or by other pathologic changes. Before stilbamidine injections are given, the renal function should be tested. Before treatment, and once per week during treatment, the blood should be analyzed for urea, nonprotein nitrogen, and creatimne

Stilbamidine can be given to patients who have signs of renal failure but in such cases not more than two or three injections per week should be administered

The peripheral blood changes which were occasionally observed could be expected to occur during the natural course of this disease. In one patient eosinophilia developed

With the large dose of stilbamidine given to myeloma patients there is a high incidence of neuropathy due to toxic degeneration of the principal sensory nucleus of the trigeminal nerve. In most of the patients the symptoms only cause discomfort, which tends to subside gradually. In 1 patient (Case 2 of Table 4) the discomfort was considerable. The neuropathy does not endanger life, and once it develops there is no progression even after resumption of stilbamidine injections.

# NEW SEMINAR ON VENEREAL DISEASE CONTROL FOR PRACTICING PHYSICIANS

A new series of lectures for practicing physicians on the diagnosis, treatment, and management of venereal diseases will start at the New York City Department of Health, 125 Worth Street, Manhattan, on Saturday morning, September 13 Meetings will be held every Saturday morning at 10 30 AM through December 20 Experts in special fields of venereal disease control will participate in the seminar, lectures will be illustrated

No registration or fee for the course will be required Sessions are informal Physicians who attend may be reached by their offices at WOrth 2-6900, Extension 460

All meetings will be held in Room 330

The schedule of lectures follows September 13,

Practical Aspects of Immunity in Venereal Disease, September 20, Modern Treatment of Gonorrhea, September 27, Psychosomatic Aspects of Venereal Disease, October 4, Diagnosis and Treatment of Early Syphilis, October 11, Late and Latent Syphilis, October 18, Cardiovascular Syphilis, October 25, Neurosyphilis, November 1, The Minor Venereal Diseases, November 8, Syphilis of the Eyc, November 15, Differential Diagnosis of Early Syphilis, November 22, Office Treatment of Early Syphilis with Pencillin, November 29, Syphilis in Pregnancy, December 6, Serologic Tests for Syphilis, December 13, Reactions Occurring in the Therapy of Venereal Diseases, December 20, Nonvenereal Diseases of the Gemtalia.

### HEMOLYTIC DISORDERS\*

Recent Advances in Diagnosis, Prevention, and Treatment

LAWRENCE E Young, M.D. Rochester New York

(From the Department of Medicine the University of Rochester, School of Medicine and Dentistry and the medical clinics of the Strong Memorial and Rochester Municipal hospitals)

THE individual types of hemolytic anoma L are relatively rare, but collectively they con stitute a sixable group During the past decade much has been learned concerning the various mechanisms of rapid red cell destruction, and it. therefore, is appropriate that we review briefly recent developments pertaining to this clinically important and complex group of disorders. The purposes of this paper are to present some of the newer concepts of hemolytic mechanisms, to describe recently developed diagnostic procedures, and to comment on preventive and thera pentic methods.

### Classification

A working classification of hemolytic anemias is given in Table 1 It is helpful to divide this heterogeneous collection of diseases into two large groups. In the first group supposedly normal red cells are acted upon by abnormal extracellular forces, and in the second, the erythrocytes themselves are defective and therefore subject to rapid destruction Many of the extracorpuscular causes of hemolysis are well established even though the exact mechanism of their action is not understood Among these are chemical agents such as phenythydrazine and sulfanilamide, physical agents such as heat, when productive of severe thermal burns, and infectious agents such as malaria parasites

Of the antibodies which may be responsible for hemolytic phenomena, anti A, -B, and -Rh are best known More will be said later concerning these and the other types of antibodies Insted

The role of an overactive spleen in destroying not only red cells but also white cells and platelets has been stressed, particularly by Doan and his associates 1 Although the spleen is no longer considered an important graveyard for eryth rocytes under normal conditions, the phagocytic cells of the spleen may at times become

Presented at the 141st Annual Meeting of the Modical Society of the State of New York, Buffalo, General Sessions Symposium on Hematology May 9 104.

The observations described in this report were made ander a contract between the University of Rochester and the Office of Naval Research.

"The structure owhich hypersplenium" may be responsible for the symptomatic hemotytic assemise occasionally seen is association with other diseases, sepsellily malignately is uncurrian. This variety of hemotytic disorder has not been included in the elassification given in Table 1.

overactive and may be responsible at least in part for the development of anemia \*\*

If normal red cells are transfused to patients in whom there is an extracorpuscular cause for hemolysis, the donated cells may be destroyed as rapidly as the patient's own erythrocytes 1-1 If the patient's cells, on the other hand, are removed from their abnormal environment and transfused to a normal recipient they may have a normal life expectancy of from 100 to 120 days. In patients having intracorpuscular defects the results of transfusion are exactly the reverse That is, normal donated cells are handled in a perfectly normal manner, while the patient's own erythrocytes are quickly disposed of when given to a normal recipient. 3-6 Transfusion studies of this type have been carried out in a number of laboratories in recent years and have aided materially in localizing the abnormality in various types of hemolytic anemia Such studies are usually made by transfusing cells which differ from those of the recipient with respect to M-N type or by giving group O cells to recipients belonging to one of the other three major blood groups Following transfusion the donated cells can then be differen tiated from those of the recipient by use of an appropriate antiserum.7

The most important types of intracorpuscular defects are listed in Table 1 Spherocytes are regularly found in congenital hemolytic anemia,

TABLE 1.—CLASSIFICATION OF HENCLYTIC DISCRICES CLASSIFICATION OF HEMOLYTIC DISORDERS.

EXTRACORPUSCULAR CAUSES

CONGENITAL SPHEROCYTIC HEMOLYTIC ANEMIA SICKLE CELL ANEMIA THALASSEMIA (COOLEY S) PAROXYSMAL NOCTURNAL HEMOGLOSINURIA ATYPICAL HEMOLYTIC ANEMIA

but they are no longer considered pathognomonic of this disease because they have been observed in many of the so-called "acquired" cases due to extracorpuscular causes <sup>8</sup> Spherocytes, which are thick cells appearing densely stained in smears, are regarded by some as injured cells, and a wide variety of injurious agents, such as heat and antibodies, has indeed been shown to cause spherocytosis <sup>9</sup> It seems likely, however, that in congenital hemolytic anemia the red cells are inherently defective, whereas in acquired hemolytic anemias the cells are normal when released from the bone marrow but are rendered spherocytic by the action of such agents as heat, chemicals, or antibodies

Sickled cells may not be present in smears of the peripheral blood of patients with sickle rell anemia but they are easily produced in sealed wet preparations or in blood through which carbon dioxide has been bubbled vigorously Target or "Mexican hat" cells, which are thin and highly resistant to hemolysis in hypotonic salt solution, are regularly found in ordinary smears of blood from patients with sickle cell anemia and are seen also in smears prepared from patients with thalassemia It should be emphasized that thalassemia or Mediterranean anemia ocurs in both the severe form known as Cooley's anemia, or thalassemia major, and in the mild form known as thalassemia minor 10 The incidence of the latter among the Italian population of Rochester has been estimated at 4 per cent by Neel and Valentine, a figure which is surprisingly high 11 In both forms of thalassemia and in sickle cell anemia there is evidence of increased erythrocyte destruction despite the fact that the cells are thin and resistant to hemolysis in hypotonic saline 12

Paroxysmal nocturnal hemoglobinum is a rare but fascinating disease. Here again the defect resides within the erythrocyte which, although morphologically normal and having normal resistance to hypotonic salt solutions, is highly sensitive to slight decreases in the pH of its environment. According to Ham, hemoglobinemia is constantly present but becomes sufficiently severe to produce hemoglobinum at night as a result of slight increase in the acidity of the blood during sleep. 13

There are still other varieties of hemolytic anemia in which the erythrocytes lack distinctive morphology but transfusion studies have shown them to be defective 4,14 For the time being it seems best to label such cases merely as "atypical"

# Role of the Spleen

It is generally conceded that the spleen is not essential to the maintenance of health and that

it is much more important pathologically than physiologically Its pathologic activities may be of at least three varieties phagocytic, "hormonal," and mechanical Reference has already been made to the occurrence of excessive phagocytosis of red cells, white cells, and platelets. a phenomenon which may be selective or total in the latter case, the result is "panhematopenia" Dameshek<sup>15</sup> has been more impressed with the apparent inhibitory effect of the overactive spleen upon the bone marrow than with phagocytosis within the spleen, and he suggests that the spleen may elaborate one or more hormones controlling maturation and delivery of red and white cells and platelets in the marrow Despite the fact that such regulatory substances have not been isolated this hypothesis receives indirect support from a number of recent clinical and laborators observations

Splenectomy has been dramatically successful in certain illnesses characterized by splenomegaly, hyperplastic marrow, and diminution of one or all formed elements of the blood Regardless of whether the spleen produces this clinical picture by reason of its phagocytic activity or by excessive elaboration of humoral substances inhibiting the delivery of cells and platelets from the marrow, the fact remains that splenectomy may be beneficial <sup>16</sup> It is, therefore, important that the various forms of hypersplenism be differentiated from aplastic anemia and "toxic" or "allergic" agranulocytosis and thrombopenia. In making these distinctions examination of the bone marrow is essential

The phagocytic and the possible humoral activities of the spleen are elusive subjects for investigation, but obviously deserve intensive study in the years ahead The mechanical action of the spleen, upon red cells at least, is more readily demonstrable and has become more clearly understood as a result of recent obser-On the basis of their work with transilluminated mammalian spleens. MacKenzie, Whipple, and Wintersteiner 16 have presented the diagram of splenic circulation shown in In the relaxed spleen, blood flows from the arterioles into the pulp spaces where stagnation and hemoconcentration occur, and the cells are thus separated to some extent from the antihemolytic effect of plasma During their stay in the pulp, even normal red cells become thicker, and in congenital hemolytic anemia the defective red cells become still thicker and more fragile 17,18 It is relatively easy for discordal cells to pass from the pulp through the slit-like openings in the venous sinusoids, but the very thick, spherocytic cells cannot escape so readily It appears that they may be retained

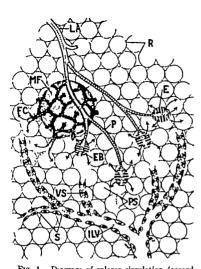

Fig. 1 Diagram of splenic circulation (according to Mackenzie Whipple, and Wintersteiner is reproduced by courters of Wistar Institute of Anatomy and Biology) LA lobular artery MF malpighian follide, P penicillus, FC follide capillary E cilipsod EB lateral channel in wall of ellipsoid, R red pulp reticulum PS pulp spaces, VB venous sinus ILV intra lobular vein B stigmata in walls of venous sinus and intralobular vein

in the pulp in intimate contact with phagocytic cells which destroy them, or eventually they may escape only to be destroyed elsewhere in the body <sup>10</sup>

The selective action of the spleen upon abnormal cells of patients with congenital spherocytic hemolytic anemia has been studied recently by Emerson, Shen Ham, and Castle, 17 and their observations have been confirmed in our labora tory at the Strong Memorial Hospital 18 Normal cells of types which could be differentiated from those of the recipients were transfused to these patients a few days prior to splenectomy Immediately after operation red cells were washed from the splenic pulp and it was found that most of the erythrocytes trapped in the pulp were the patient s own cells the proportion of donated corpuscles in the peripheral blood being much higher than in the spleen The fragility (ocmotic and mechanical) of the normal donated cells was normal in the peripheral blood and only slightly increased in the spleen, while the fragulty of the patient s own cells was much greater in the splenic pulp than in the peripheral blood. It appeared that the inherently defective cells of these patients were selectively retained in the splenic pulp and that the thickness and fragility of these cells were somehow selectively increased

That this selective action upon abnormal ervth rocytes is due to defectiveness of the cells rather than to any specific abnormality of the spleen in congenital hemolytic anemia seems likely in view of our recent perfusion experiments 18 Cells from a splenectomized individual with the congenital spherocytic defect were mixed with normal cells of a different type and perfused through the arteries of a spleen immediately after its removal from a patient with idiopatine thrombopenic purpura It was found that the abnormal cells were selectively removed from the mixture, and at the end of perfusion these cells were found densely packed in the splenic pulp despite the fact that the spleen had been removed from a patient whose disease was not hemolytic anomia but thrombopenic These observations together with purpum Dacio's perfusion studies of a different type 20 make it seem possible that a perfectly normal spleen might selectively retain defective cells in its pulp \*\*\*

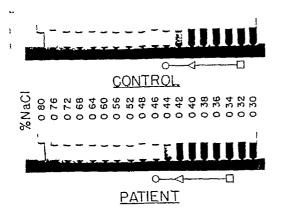

### Laboratory Tests

It is appropriate to consider next some of the more useful laboratory procedures based upon the newer concepts of hemolytic mechanisms which have just been reviewed

Osmotic Fragility -It is well known that in the majority of cases of concenital hemolytic anemia the fragility of the red cells in hypotonic saline is increased. This test has definite limits. tions from the diagnostic standpoint however, since increased fragility together with spherocytosis may be found in certain acquired cases On the other hand there are some patients with the congenital disorder whose red cells have normal or nearly normal fragility even when tested by sensitive methods employing a photoelectric colorimeter to measure the degree of hemolysis in each tube of salt solution is particularly true of persons whose disease is quiescent but whose blood may be under close scrutiny because of family relationship to a patient suffering from an active hemolytic pro-CERR

As a result of the observation by Ham and Castle<sup>11</sup> and Emerson Shen Ham, and Castle<sup>12</sup> that cells incubated in vitro at body temperature

<sup>\*\*\*</sup> Although the trapping or mechanical effect of the splena I considered of great importance in the pathogenesis of congenital hemolytic anomia, it is acknowledged that a complete explanation of all of th pile mean of this disease is not yet at hand. The era t cause of h molytic crises is particularly mystations.

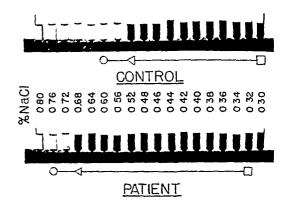

# FRAGILITY OF <u>FRESH</u> RED CELLS IN HYPOTONIC SALINE

Fig 2 Hemolysis of fresh red cells in hypotonic saline

have increased fragility, improved methods of measuring this change are now being developed The usefulness of the modified fragility test is illustrated in Figs 2 and 3 The circles in these figures indicate the tubes in which hemolysis begins, the triangles the tubes in which hemolysis becomes marked, and the squares indicate the tubes in which hemolysis is complete In Fig 2 the results of a test on fresh normal cells are compared with those obtained with fresh cells from a patient with congenital hemolytic anemia Although the latter cells appear to be slightly more fragile, the difference is not significant When the two samples of blood were incubated for twenty-four hours at body temperature and retested, the difference in fragility was very marked, the normal cells having undergone a modest increase while the defective cells from the patient showed a far greater increase

In recent months we have tested the fragility of both fresh and incubated erythrocytes from 18 patients with the congenital defect and from 4 patients with atypical or acquired hemolytic Our results to date suggest that a anemia marked increase in fragility with incubation may prove to be rather specific for the congenital disorder Indeed it appears that in vitro incubation may produce essentially the same change in the defective erythrocytes of this disease as is produced in vivo in the splenic pulp It is particularly useful to apply the incubation test to cells from close relatives of patients suspected to have congenital hemolytic If this disorder is inherited as a Mendelian dominant, the cellular abnormality should be demonstrable in one of the two parents of each patient In some cases, however, the

# FRAGILITY OF INCUBATED RED CELLS IN HYPOTONIC SALINE

Fig. 3 Hemolysis of incubated red cells in hypotonic saline. Note that tubes above 0.48 per cent NaCl are spaced at intervals of 0.04 per cent defect may be apparent only after incubation, if at all

Mechanical Fragility —Determination the mechanical fragility of erythrocytes22 23 appears to be distinctly worth while in studying patients with certain types of hemolytic anemia The procedure described by Shen, Castle, and Fleming<sup>22</sup> is carried out by placing a small amount of oxalated or defibrinated blood in an Erlenmeyer flask containing glass beads The flask is then rotated as shown in Fig 4, thus subjecting the cells to a standard amount of The hemoglobin liberated from the cells during this period is measured and compared with controls which have been subjected This test is to the same amount of trauma attractive on theoretic grounds for the obvious reason that it subjects cells to the sort of mechanical buffeting which they doubtless receive in circulation

It has been found 17 18 23 that the mechanical fragility of erythrocytes freshly drawn from patients with congenital hemolytic anemia is significantly greater than that of normal cells When the test is carried out on corpuscles which have been incubated, there is usually a moderate increase in the mechanical fragility of normal cells while corpuscles from patients with the congenital spherocytic defect show a very marked increase Here again incubation aids materially in demonstrating the difference between normal and pathologic cells nature of the change occurring in erythrocytes with incubation is not understood, but the increases in thickness and volume and in both osmotic and mechanical fragility of cells incubated in vitro are comparable to the changes

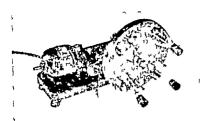

Fig. 4 Rotator used in testing mechanical fragility of crythrocytes.

observed in cells which have been trapped in the splenic pulp. It appears that further study of the effects of in vitro incubation of crythrocytes may throw considerable light upon the mechanism by which these cells are unfavorably altered by the spleen

In a few cases of a typical hemolytic anemia, increased mechanical fragility of crythrocytes has been demonstrated even though the osmotic fragility was normal or actually decreased in It is also of interest that increased mechanical fragility has been observed in the presence of cold agglutinins and isoanglutinins and in experiments with sickled cells if Further study will be necessary before the clinical applications of this new and interesting laboratory procedure can be fully stated

Serologic Tests — Among the sorologic manipulations which have proved most useful in studying hemolytic disorders are the simple presumptive tests recommended by Ham<sup>24</sup> and outlined in Fig 5 Fresh defibrinated blood is placed in each of three tubes. The first tube is placed in each of three tubes. The first tube is incubated at body temperature then centrifuged if hemoglobin is present in the supernatural serium presence of a warm hemolysin is suggested and a more elaborate test with suitable controls is made.

The second tube is chilled in cracked ice, then incubated and contrifuged This is the Donath-Landsteiner test which, if positive and confirmed by a more complete procedure indicates that the patient is probably suffering from paroxysmal cold hemoglobinuma In this curious, malady which is nearly always associated with syphilis, antibody becomes attached to red cells at low temperature, and in the presence of complement hemolysus occurs when the blood is warmed is presumed that a similar reaction takes place in vivo thus causing hemoglobinuris when the patient is warmed indoors after chilling outdoors. When the Donath Landsteiner test is carried out the presence or absence of cold agglutinins can often be determined by examining the chilled INCUBATE 1-2 HRS.

blood for agglutination before it is warmed. If only cold agglutinins are present clumping disappears when the blood is warmed and no hemolysis occurs Cold agglutinins have been observed in a variety of conditions but notably in atypical pneumonia and in some cases of hemolytic anemia both congenital and ac quired " Since the mechanical fragility of agglutinated crythrocytes is increased it is not unreasonable to suppose that these antibodies may cause hemolysis in vivo when blood is cooled in the extremities of the body be pointed out however that the exact significance of cold agglutining is not yet clear and that much more complicated tests than those described here are necessary in order to characterize the agglutining in any given case

In the third tube of the series under consideration is placed fresh defibrinated blood which has
been acidified with carbon dioxide. If hemolysis
is apparent after centrifugation a more elaborate
test with controls is carried out to confirm or
disprove the diagnosis of paroxysmal nocturnal
hemoglobinum. It can be demonstrated that
the defect in this disease is in the crythrocyte
since fresh normal sorum can be substituted for
the patient's serum in carrying out the acid
hemolysis test. If normal cells are mixed with
the patient's serum however, the result is always
negative

In the investigation of hemolytic disorders prior to 1944 sorologic tests were designed to demonstrate hemolysins and agglutinins only Since the discovery of blocking antibodies by Wiener<sup>14</sup> and Race<sup>21</sup> in that year, additional tests have been developed which apply particularly to the Rh factor but have applications in the study of other hemolytic diseases as well Highly diagrammatic aketches of the possible antibody red cell relationships in these newly discovered reactions are shown in Figs. 6 and 7 Agglutinins, which are thought to be bivalent or multivalent antibodies, may be regarded as

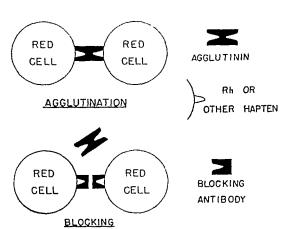

Fig 6 Agglutination and blocking reactions (modified from drawings by Wiener<sup>28</sup>)

attaching themselves to Rh or other haptens on the red cells and thus bringing about agglutination somewhat as sketched in Fig 6. The exact nature of this reaction is not understood. There are, moreover, many haptens on each red cell, and the reaction between these factors and agglutinins in the serum is three-dimensional. It should be stressed that the illustration is greatly simplified.

Blocking antibodies are regarded as univalent or incomplete and by themselves they are incapable of causing visible clumping of cells. When they are attached to erythrocytes, however, their presence may be detected by adding a known agglutinating serum which then fails to cause agglutination because the blocking antibodies are already attached to the specific red cell receptors. Despite the fact that incomplete antibodies by themselves are unable to cause agglutination in vitro, they are responsible for the majority of cases of hemolytic disease of the newborn and perhaps other types of hemolytic anemia.

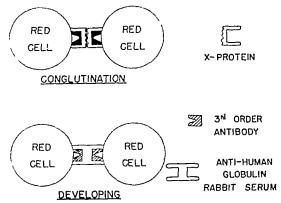

Incomplete antibodies may be demonstrated more easily by means of the so-called "conglutination" test, first described by Wiener and illustrated in Fig 7. A serum containing such antibodies is mixed with Rh positiv', cells suspended in plasma, serum, or a concentrated albumin solution instead of in saline. The proteins (X-protein of serum) of these suspension media are somehow able to produce clumping of cells sensitized by the univalent antibodies to the light of the transfer of the sensitized by the univalent antibodies to the light of the light of the light of the sensitized by the univalent antibodies to the light of 

Fig 7 Conglutination and developing reactions The conglutination reaction is sketched according to Wiener's concept <sup>28</sup>

transfusion, particularly in cases in which the recipient is thought to be sensitized to the Rh factor. The simple expedient of suspending the donor's cells in his own serum rather than in saline before mixing with the recipient's serum may detect otherwise inapparent sensitization of the recipient and may actually be life-saving.

Since the incomplete antibody, like the agglutinin, is a gamma globulin, its presence on a red cell can be detected by still another test which employs serum from rabbits immunized with human gamma globulin 29 The antiglobulin serum causes agglutination of washed erythrocytes to which human globulin is adsorbed specifically This procedure which detects not only blocking antibodies but also globulins referred to as "third order" antibodies, has been named the "developing test" by Hill and Haberman<sup>30</sup> because of the analogy to photographic development Although the exact clinical significance of third-order antibodies (shown with cross-hatching in Fig 7) is not yet clear, it has already been demonstrated that the usefulness of the developing test is not limited to the Rh It has been found 18,31, 32 that cells from patients with certain types of acquired hemolytic anemia are regularly agglutinated by the rabbit serum, presumably because an antierythrocyteglobulin is adsorbed to these cells Serum from such cases may contain no demonstrable agglutinins or hemolysins, but immune bodies, perhaps of the "third order," nevertheless, are fixed to the red cells of the patient and the cells may continue to give positive reactions even during remission following splenectomy rocytes from patients with intracorpuscular defects, on the other hand, give negative reactions with rabbit serum, as might be expected It is likely that this simple test will prove helpful in differentiating congenital spherocytic anemia from certain acquired cases, a differentiation which is sometimes difficult on clinical grounds

<sup>†</sup> It should be emphasized that nomenclature in this field is unsettled. At the International Hematology and Rh Conferences held in Dallas Texas and Mexico City in November 1946 the use of the terms \protein and conglutination was rejected (News and Views Blood 2 204 (March) 1947) These terms have been employed in this paper however because of their frequent appearance in recent literature

TABLE 2 -CLASSIFICATION OF RIN BLOOD TYPES (ACCORDING TO WIENERS)

Rive (Rive)	- '	+	+	15.0	Rh+
RON Rhy	+	+	+	145	)

Since splenectomy is uniformly beneficial in the congenital disease and somewhat of a gamble in the acquired disease the rabbit serum test may prove to have prognostic value. It obviously deserves further study

#### Prevention

Among the most important recent advances in the prophylaxis of hemolytic diseases are those pertaining to the Rh factor There is an understandable tendency among clinicians to shrink from consideration of the increasingly complex Rh-Hr system, but actually the essential features of the problem are relatively simple and can be stated briefly Rh typing is carried out as outlined in Table 2, by use of three antisera which distanguish eight Rh types.28 This procedure is largely of academic and medicolegal interest, however, and the clinician will do well to focus his attention on Rh testing which is done by mixing cells with an anti Rho serum alone This is the only variety of Rh antiserum avail able commercially and is the only variety needed for ordinary hospital use. The 15 per cent of white individuals whose cells contain only the Rh' or Rh" factor give negative reactions with the standard or anti Rhe serum and should be handled clinically as though they were Rh negative

It is now appreciated that the cells of all blood doors and all recipients should be tested for the Rh factor and that Rh-negative recipients should be given only Rh-negative blood except in emergencies. Such a polley will not only prevent ultimate hemolytic reactions to transfusion among recipients of both sexes but it will also prevent unnecessary sensitisation of Rh negative fermale recipients who are potential mothers. Sensitisation to the Rh factor may persist for many years, perhaps for life. 31 An Rh-negative woman who has been transfused with Rh-positive blood, even in early childhood may

therefore less her first child as well as subsequent children, due to development of erythroblastosis fetalis. This tragedy may be prevented to a large extent, at least in the firstborn, by adhering rigidly to the policy of transfusing only Rh negative blood to Rh-negative recipients.<sup>12</sup>

Fortunately at least 05 per cent of Rh negative women with Rh positive husbands do not have crythroblastotic children, fland this fact should be made clear to the many couples whose fears have been unnecessarily aroused by carelessly worded articles in the lay press. Once a Rhnegative woman has had a child with crythroblastoss, however, there is no certain method by which the development of this form of hemolytic disease can be prevented in subsequent Rh positive children. Here is indeed a fertile territory for investigation

Recent studies on the anti-A and -B agglutiums have shown conclusively that excessive use of universal donors, and also of plasma, may cause appreciable destruction of recipient's cells.<sup>3</sup> - <sup>34</sup> Fortunately this hazard can be eliminated by neutralizing the anti-A and B agglutinias of group O blood with small amounts of a solution of A and B factors—a procedure which Klend shop and Witebsky- <sup>34</sup> have shown to be safe and of particular value in emergencies when accurate trying cannot be done

Although blackwater fever is rarely seen in New York State it should be mentioned here that this serious complication of falciparum malaria can be prevented effectively by recognized antimalarial measures

#### Treatment

Aside from eradication of such extrinsic agents as parasites and chemicals, the only forms of specific therapy for hemolytic anemias are transfusion and splenectomy. One of the important contributions of wartime research was the demonstration that whole-blood transfusions are essential in the management of severe burns and that the anemia in these cases is due in part to a brief period of rapid red cell destruction 44 ft With regard to the treatment of erythroblastosis fetalis Wiener et al 42 and Wallerstein 44 have shown that exchange transfusion, in which most of the infant's blood is replaced by Rh negative blood may be dramatically successful in selected cases, especially when carned out during the first few hours of life. The exact indications for this rather drastic procedure are not vet clear Transfusions are sometimes

<sup>††</sup> According to Dr. Donald H. Karlber of Rochester New York (personal communication) only 1 of 33 Rh-negative women with Rh-positive husbands has hildren with crythroblastosis (stalis. The experience f other investigators is similar.

Toncet 1 550

necessary and temporarily beneficial in the hereditary hemolytic disorders, but in this aspect of therapy there are no recent developments which have been evaluated adequately

Splenectomy almost invariably produces marked improvement in patients with congenital spherocytic hemolytic anemia, provided any accessory spleens are removed as well as the mother spleen Jaundice disappears and the red cell count uses to normal following operation. but the erythrocytes, nevertheless, remain defective and one night guess that if a normal spleen could be transplanted into such a patient, rapid red cell destruction would again be ob-In contrast to the favorable results obtained in patients with the congenital spherocytic defect, splenectomy is without value in sickle cell anemia, thalassemia, and nocturnal hemoglobinuria

One of the most important recent advances in the treatment of hemolytic disorders is the recognition of the fact that splenectomy may produce dramatic results in some of the acquired or atypical cases, and in those included under the term "hypersplenism" Since there is relatively little to lose by splenectomy and much may be gained, it is unwise to delay operation beyond the period necessary for carrying out essential diagnostic procedures Unfortunately. however, the prognosis must always be guarded for a considerable time in these cases because many show little or no improvement following operation There is great need for intensive study of this heterogeneous group of hemolytic anemias in order that adequate criteria for splenectomy may be formulated

# DIAGNOSIS OF CORONARY THROMBOSIS

Steincrohn\* called attention in 1940 to a new observation said to be helpful in the diagnosis of coronary thrombosis, namely the rhythm and periodicity of the pain as the most characteristic feature of the syndrome. This periodicity holds true for indefinite attacks as well as for those in which the pain and shock are so prominent that the diagnosis is unquestioned According to him the pain comes and goes in cycles Morphine should not be withheld when the patient is first seen in an attack, since the pains will continue to recur and remain recogniz-

able before the morphine exerts its full effect. Steincrohn found this pain syndrome invaluable in ruling out the presence of extracardiac anginas such as acute gallbladder disease, ruptured peptic ulcer, actue pancreatitis, intestinal obstruction, acute pneumothorax and pulmonary embolism or infarct. The cause for the recurring pains is not clear

Theoretically the symptom might be AIplained on the basis of the changing level of anovemia, which is dependent on the adjustments which the cardiac circulation is called on to make in the first few hours following the immediate shock of the attack—Editorial, JAMA June 7, 1947

### CLINICAL MANIFESTATIONS OF HODGKIN'S DISEASE\*

JOHN H TALBOTT, M.D., Buffalo, New York

(From the Department of Medicine Buffalo General Hospital and University of Buffalo School of Medicine Buffalo, New 1 ork)

THE clinical features of Hodgkin's disease I need no special emphasis when they conform to the textbook description of the fully developed malady Swelling of the glands of the neck is the hallmark of the condition Pruntus, ma laise, weakness, fever and weight loss are the usual complaints. Men are affected more frequently than woman and the highest in cidence is in the middle decades of life  $\lambda$  ray examination of the chest may reveal hilar or mediastinal enlargement. From two to ten years after the onset of symptoms, the patient dies from cachexia, an intermittent infection, or

from pressure on vital structures

There are many clinical variations of the above description, particularly in the earlier phases A significant percentage of patients with Hodgkin's disease either do not present this typical picture or present this typical picture with one or more unusual and additional manifestations Hence, one of the motives in the preparation of this communication is to stress the vagaries of this condition Second, such a discussion is timely in view of the frequent admission to a general hospital of patients with this disease The increasing number of patients seen on the wards suggests that the disease is recognized earlier now in comparison with a generation ago Third, a new form of therapy, nitrogen mustard has been made available recently and it is appropriate that this subject be considered before this assembly

Fourteen patients with Hodgkin's disease were admitted or readmitted to the Buffalo General Hospital in recent months. Six of this number were unusual in one or more aspects This group has provided interesting clinical data that will be discussed in reference to each individual case. The first patient has had a benign form of the malady and has had few typical symptoms while under observation for a period of more than four years. The second patient had a diagnosis of Kaposi a sarcoma of the skin made several months prior to the appearance of enlarged glands. The third patient had a profound anemia and at autopsy showed extensive bone marrow infiltration. The fourth

patient had pruntus and a generalized skin cruption several months preceding the suspicion of Hodgkin's disease. The fifth patient had chronic jaundice hepatomegaly and splenomeg aly for more than two years The sixth patient had a high percentage of cosmophils in the peripheral blood Two of the patients were treated with nitrogen mustard with minimal improvement.\*\*

## Case Reports

Case 1 -R. II., a woman, aged 58 was admitted to the hospital in 1942 complaining of cardiac symptoms. A diagnosis of chrome valvular heart disease rheumatic in cause was made. In obtaining the history the patient stated that the glands in her nock had been enlarged for a few weeks. The physical examination revealed in addition to the cardiac findings adenopathy in the cervical axillary and inguinal regions. The liver and spleen were not felt. Scattered over the body were lesions that the dermatology service considered to be crythems multiforme. The laboratory studies were not remarkable except for a slight leukocytosis. There was no evidence of hilar enlargement of the chest by x ray A skin biopsy was considered to be consistent with crythema multiforme. The biopsy of a cervical node showed simple inflammatory hyperplasia. The patient's primary complaints were cardiac and in the absence of a pathologic or clinical diagnosis of Hodgkin's disease no x ray therapy was advised

The following year the patient was admitted to a cancer hospital on the advice of her local physician In that institution another biopsy was taken from the cervical chain of glands and Reod-Sternberg giant cells were observed. X-rays of the chest at this time showed mediastinal enlargement. A long course of radiation therapy was given which was repeated on two occasions. Follow up x-rays of the chest six months after discharge were negative for mediastinal glands.

The patient was readmitted to the Buffalo General Hospital on several occasions in 1946 and 1947 and in each instance the complaints were cardiac. The generalized glandular adenopathy permeted. There was no febrile reaction at any time that was

attributable to Hodgkin a disease.

Comment -This patient had had minimal but generalized glandular adenopathy for approximately four years A biopsy of a cervical gland in 1943 was characteristic of Hodgkin's disease Radiation therapy was followed by disappearance of the

Presented by invitation, at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo General Sessions, Symposium on Hematology May 9 1947

These studies were supported in part by a generous con-tribution from Mrs. Kathleen Chard of Chestnut Hill Mass achusette.

<sup>\*\*</sup> The author is indebted to Drs. Stuart Vaughan, A. H. Aaron, and Earl Osborne for referring one or more of these cases to the hospital

glands in the mediastinum and reduction in size of the superficial glands. The mild clinical course, absence of fever, and no enlargement of the liver and spleen suggest the benign form of the disease which has been designated by Jackson and Parker<sup>1</sup> as Hodgkin's paragranuloma

Case 2—M S, a woman, aged 56, was admitted to the hospital twice in 1935 At the first admission a diagnosis of hypertensive heart disease and rheumatoid arthritis was made. The blood pressure varied between 190/110 and 200/130 A few weeks later she was admitted because of painless jaundice which was believed to have been associated with an attack of catarrhal hepatitis. In the following six years she had frequent epistaxis and the blood pressure when taken was in the hypertensive range.

Early in 1946 she was seen in the dermatology clinic for unusual skin changes A diagnosis of Kaposi's disease was made at this time This was treated by radiation with little or no improvement In June, 1946, she was admitted to the hospital because of lumps in the right axilla. On physical examination she had a low-grade fever and a blood pressure of 230/120 In the supraclavicular, avillary, and inguinal regions there were chains of glands Over both upper and lower extremitics there were many reddish-purple circumscribed papular lesions that were neither itchy nor painful. The laboratory studies of the blood and urine were normal The 1-ray of the chest was negative for mediastinal enlargement A barrum meal showed a pressure defect on the stomach and the possibility of a retroperatoneal mass was postulated biopsy of the avillary gland showed changes characteristic of Hodgkin's disease and 1-ray therapy was The general condition was essentially unaltered in the following six months

The patient was readmitted late in 1946 for a course of nitrogen mustard treatment ized glandular adenopathy was present purplish skin lesions had spread slightly The red blood cell count varied between 34 and 38 million, the white blood cell count prior to giving nitrogen mustard was 3,600 with an essentially normal dif-The sedimentation rate was norferential count The 1-ray of the mal The patient was afebrile chest showed no hilar enlargement Four intravenous injections of nitrogen mustard were given with few untoward symptoms. On discharge the blood studies were similar to those on admission The patient believed that she was better subjectively At no time in the following months did the glands or skin lesions subside appreciably

Comments—This case is an instance of Hodg-kin's disease in which superficial glandular adenopathy was preceded by evidence of Kaposi's skin sarcoma. The chronologic association between these two maladies was fairly close but the etiologic association is difficult to establish. Although a variety of skin manifestations accompany or precede glandular Hodgkin's disease, reticuloendothelial tumors with formation of blood vessels have received scant attention in current available literature. In a series of 63 patients with Kaposi's disease, not a single instance of associated Hodgkin's

disease was noted by Choisser and Ramsey: Hence, if these conditions coexist it is believed to be an unusual situation

Case 3 -H C, a man, aged 45, was first admitted in June, 1946, with complaints of swollen glands, thills, fever, cough, dyspnea, weakness, palpitation, and a 30-pound weight loss over a two-year period. On physical examination the patient was febrile and pale, there was marked enlargement of the cervical glands and moderate enlargement of the axillary glands. The liver edge was palpable at the umbilious and the spleen was palpable 4 cm. below the costal margin The red blood cell count was 3 3 million, the white blood cell count was 10,500 with a differential that was essentially normal sedimentation rate was clevated markedly The x-ray examination of the chest was negative lymph node biopsy was suggestive but not diagnostic of Hodgkin's disease Following 1-ray therapy the fever subsided and the patient improved subjec-

The patient was readmitted in October, 1946, because of increasing weakness and a chronic cough The anemia had become worse and had responded only to repeated transfusions of the chest at this time showed enlargement of the hilar shadows with a mass in the superior mediastınum The size of the liver and spleen was un-The spiking temperature had returned changed Following five injections of nitrogen mustard the superficial glands, liver, and spleen decreased considerably in size, and the 1-ray of the chest showed diminution in size of glands in the mediastinum The temperature was normal on discharge

The final admission was in January, 1947 subjective improvement following nitrogen mustard had persisted for two weeks only swelling of the glands, chills, and fever returned promptly In addition, there was swelling of the abdomen and legs from ascites and edema, respec-On physical examination the liver was unchanged in size while the spleen was 6 cm below the costal margin The examination was otherwise as noted above The laboratory studies showed a profound macrocytic anemia and a leukopenia as low as 2,500 with not more than 10 per cent lymphocytes The sedimentation rate was markedly elevated Re-examination of the chest by x-ray showed an extension of the hilar and pulmonary parenchy mal involvement The patient continued to have a spiking temperature and tachycardia, and in spite of further x-ray therapy to the mediastinum, died in February, 1947 The autopsy examination showed generalized Hodgkin's disease which included involvement of the lymph nodes, lungs, liver, spleen, kidneys, and bone marrow

Comment—The general dissemination of the granulomatous tissue is of clinical significance in this case. In this small series this is the only patient having Hodglin's disease who is dead or even acutely ill. The appearance of a profound anemia which did not respond except to whole blood transfusions was a grave prognostic sign. Undoubtedly the extensive bone marrow involvement was responsible for the depression in blood formation.

Profound anemia is not a frequent accompaniment of Hodgkin s disease except in the fulminating stage Uchlinger! has attached considerable significance to the leukopenia which may be a result of bone marrow infiltration. It is of note that in this patient a slight leukocytosis was observed at the first admission but subsequently a leukopenia with an increase in percentage of polymorphonuclear cells developed. The liver and spleen were grossly enlarged on the first admission the enlargement was confirmed at the postmortem examination

Case 4 - 1 W a man, aged 54 was first admitted in August 1046 for a generalized bullous crythema tous lesion of only a few days duration acutely ill on admission had a temperature as high as 102 F., and skin lesions that were considered to be erythema multiforme by the dermatology service In addition, there were a few small glands in the supraclavicular area on the right the enlargement of which was attributed to the cutaneous involvement The white blood cell count was 10 000 with 50 per cent bands and 41 per cent filaments. The labora tory studies were otherwise negative. The nationt improved slightly during a ten-day hospital stay but was discharged without the temperature having returned to normal General supportive measures only were prescribed and the possibility of this being associated with a lymphoblastoma was not considered seriously

The patient was readmitted three months later because of increasing weakness, malaise, swelling of the face and persistent skin lesions Extensive lymphadenopathy of the cervical, axillary and inguinal areas was present. There was massive odema of the face and swelling of the parotid glands. The liver was palpable 2 cm. below the costal margin and the spleen was palpable 4 cm below was an crythematous papular skin rash over the The dermatology service did not alter their diagnosis of ethythema multiforme. The red blood cell count was 4,2 million the white blood cell count was 16 000 with a differential of bands 38 per cent, filaments 40 per cent, cosinophils 11 per cent, and lymphocytes 9 per cent The sedimentation rate was normal. The patient was acutely ill and an overwhelming disease such as acute disseminated lupus was considered on admission

The x-rays of the chest, however showed bi lateral hilar node involvement and Hodgkin's discase was suspected. The pathologic report of a skin and muscle biopsy respectively showed inflammatory granulomas surrounding the venous capillaries. The nodular arrangement of the cells was auggestive of specific granulation tissue. No Reed-Sternberg giant cells were seen The biopay of an axillary gland showed chronic inflammatory hyperplasia of the lymph node with the original structure entirely obscured There was a moderate number of ecsinophils and a number of plasma cells. It could not be determined whether or not the diffuse hyperplasia with reticulum cells involved pointed to an early manifestation of Hodgkin s discase There was nothing to suggest lymphosar

Since the clinical picture was highly suggestive of

Hodgkin's disease the patient was given a course of x ray therapy to the cervical and upper mediastinal nodes. Marked subjective and objective improvement followed, the temporature fell and a gain of several pounds of body weight was recorded in spite of a loss of considerable edema fluid. Yeary treatment has been continued up to the present and the patient remains essentially symptom free.

Comment—The diagnosis of Hodgkin's disease cannot be established unequivocally in this patient in the absence of pathologic findings of Reed-Sternberg cells. On the other hand the clinical picture on the second admission included the following fea tures pruritus generalized adenopathy hepatomegal, splenomegal, fever hilar and mediastinal culargement by x ray and biopsies of skin, muscles and glands which excluded other reasonable possibilities. Finally, the response to radiation treat ment was dramatic and has persisted. This patient is discussed in this report because of the pruritus and skin involvement which preceded glandular adenopathy of clinical significance.

Case 5 -S S. a woman aged 49 had a four year story of fatigue weakness, jaundice abdominal soreness and pruntus. She was admitted to another hospital in 1944 because of a weight loss of 30 pounds. A laparotomy was performed and enlargement of the liver and spleen was noted. The liver biopey showed an obstructive type of jaundice A lymph-node biopsy was suggestive but was not specific for Hodgkin 8 disease. The patient was discharged without a satisfactory diagnosis after six months in the hospital and no specific therapy was recommended. The fact that x ray therapy was not given suggests that the diagnosis of Hodgkin s disease was not entertained seriously discharge the patient remained in bed a great deal She had chills and fover at times discomfort in the splenic area, and pruritus with jaundice.

On admission to the Buffalo General Hospital in January 1947 the patient appeared well developed but chronically ill There was general bronzing of The sclerae were vellow There were a few small glands in the cervical and supraclavicular region The liver was markedly enlarged and the spleen was felt 5 cm, below the costal margin. The red blood cell count varied from 3 8 to 4 0 million The white blood cell count varied from 3 600 to 4 600 There were 26 per cent lymphocytes and 6 or cent cosmophils The cephalin flocculation and thymal turbidity tests were negative. The van den Berg concentration was as high as 1 2 mg. per cent The alkaline phosphatase varied from 27 to 34 unita. The serum globulin concentration was 2.9 Gm The stools were brown in color The fragility test was normal. The x ray examination of the chest and stomach was negative. A biopsy of a cervical gland showed changes typical of Hodgkin's disease and x ray treatment was started. Thereafter she began to gain weight and strength. She was not febrile during the six weeks hospital stay

Comment.—This is the record of a patient with low-grade jaundice enlarged liver and spleen, and no satisfactory diagnosis for a prolonged period of time. The possibilities on admission in 1047 included cirrhosis of the liver, Banti's syndrome, hemolytic jaundice, and hemochromatosis. Only after the several laboratory studies had failed to confirm each of these was a gland removed for examination and the presence of Hodgkin's disease substantiated. It is most likely that this malady has been responsible for the patient's symptoms during the past four years. The general improvement following radiation is confirmatory.

Case 6 -E L, a man, aged 39, complained of anorevia, a 40-pound weight loss, chills, fever, and sweating of four months' duration The physical examination revealed one gland in the supraclavicular space 1 cm in diameter, a few small cervical nodes, and palpable epitrochlear glands edge was felt at the costal margin The red blood cell count varied from 36 to 42 million white blood cell count varied from 37,800 to 48,500, the cosmophils varied from 33 to 45 per cent, and the lymphocytes from 7 to 11 per cent The sedimentation rate was elevated markedly tination tests for several organisms were negative The complement fixation test for trichino is was Serum globulin ranged from 29 to 35 negative Gm per 100 cc

The \-ray of the chest showed masses in both hilar regions, extending posteriorly into the mediastinal area to within three inches of the diaphragm From the roentgen appearance, the findings could be attributed to either a neoplastic or an inflammatory The aspiration of the bone marrow showed a macrocytic anemia and a 33 per cent eosinophilia The pathologic examination of the gland taken from the supraclavicular space was characteristic of Hodgkin's disease The biopsy of the muscle from the thigh showed no evidence of parasites and nothing to suggest periarteritis nodosa. The patient had a high spiking temperature (98 - 105 p r ) during the ten days of hospitalization The pulse rate varied from 80 to 130 At no time did he appear toxic or as acutely ill as his temperature would suggest He was discharged for x-ray therapy in his home town

Comment—Because of the high eosinophil count (33 to 45 per cent) in the blood and bone marrow, the clinical impression initially was either trichinosis or periarteritis nodosa. When laboratory, evidence in support of either of these possibilities was not forthcoming, a gland was removed for examination, and this showed Hodgkin's disease. Eosinophilia has been observed in this malady but is usually less than 10 per cent of the total leukocytes and is not associated with a high leukocytosis.

# Discussion

Many of the characteristic symptoms and findings of Hodgkin's disease have been enumerated in the discussion of the 6 cases. Each of the patients had generalized lymphadenopathy and in each instance the cervical glands were involved. Unexplained development of cervical or other glands should be a warning either to a patient or doctor and should be the object of as careful study as that given in instances of hemor-

rhage, pain, or loss of weight-symptoms that frequently send a patient to the physician to exclude cancer Furthermore, according to Jackson and Parker, "Any lymph node materially enlarged over a period of time and unassociated with the infection in an adult should receive a biopsy". Such an admonition is neither new nor unique but is based upon sound clinical Nevertheless, patients not infrequently are seen in the clinic who have consulted capable doctors and the glandular hypertrophy either has been disregarded or attributed to a benign process In 2 of the patients whose histories are included in this report, the glandular adenopathy was noted by the physician or called to his attention by the patient, but the desirability of a biopsy was not pursued at that time It is believed by us to be sounder clinical medicine occasionally to remove a benign gland in practice when the policy is to biopsy any unexplained hypertropluc gland than to explain away readily glandular lymphadenopathy and biopsy only if the patient is acutely ill or the disease is far advanced Early recognition of Hodgkin's disease will be posssible only if a liberal attitude Furthermore, a clinical diagnosis of Hodgkin's disease should not be made without a biopsy The cervical or axillary glands are to be preferred to the inguinal nodes radiation may alter the pathologic appearance of lymph nodes, radiation therapy should be withheld in most instances until after the biopsy has been affected

Hypertrophy of hilar or mediastinal glands by x-ray also may be of diagnostic help. Four of the 6 patients in this series had positive findings by x-ray at some time in the course of the disease. In most instances the changes were observed at the first admission in the absence of physical signs in the chest. Only one patient had symptoms which suggested mediastinal involvement. Thus we believe that any patient suspected of having Hodgkin's disease and any patient with unexplained. lymphadenopathy should have an x-ray examination of the chest.

The enlargement of the spleen is present in a majority of patients, enlargement of the liver in a smaller number. Examination of the peripheral blood is of little diagnostic help. Frequently, an anemia is observed as well as a polymorphonuclear leukocytosis with a shift to the left but obviously these findings are not diagnostic. Bone marrow aspiration usually is of no greater aid than examination of the peripheral blood except in patients with marrow infiltration.

The skin is involved in more than a third of the patients and skin symptoms, particularly pruntus, are present in a larger number. Mycosis fungoides, at times a precursor of Hodgkin's

disease, is of considerable diagnostic help. Ur ticina dermatitis, and macular papular makes are more common. Rarely is the skin the site of granulomatous deposits.

Constitutional symptoms vary greatly in their everity and time of appearance Not in frequently patients with Hodgkun's disease may have few complaints. Others may note weak ness, malaise, loss of weight, or fever. An intermittent type of fever, identified as Pel Ebstein in type is not regularly present but should be watched for in any suspected case.

# Treatment with Nitrogen Mustard

Two of the patients in this small group were treated with nitrogen mustard Several additional patients either with Hodgkin's disease or suffering from other maladies were also treated with this preparation during the past eight months. The results obtained are similar to those reported by others 7 in much larger series for longer periods of time H C was given one course of nitrogen mustard when he was acutely ill with a profound anomia. Clinical benefit followed and persisted for approximately two The drug did not appear to affect the hemotopoetic system unfavorably as judged by laboratory studies or clinical symptoms Following the short period of clinical improvement the patient relapsed and radiation therapy was It was concluded that definite but short-lived benefit resulted from mitrogen mustard while the generalized infiltration of granulomatous tissue was affected to a minimal extent

The second patient M S was given introgen mustard to ascertain whether it would have any demonstrable effect upon Kaposi s skin sarconn No change was observed in the skin lesions following one course and further treatment was not considered indicated. This patient had a nilld form of Hodgkin's disease and significant regression of the superficial glands was not noted

Eight additional patients with proved Hodg kin a disease have been given nitrogen mustard in this hospital recently Two have died and little or no effect upon the ultimate course of the disease was evident Transient benefit has been observed in most of them. However in no patient with Hodgkin's disease was greater regression of glands or abdominal organs noted than is to be expected with x-ray therapy concluded that the results observed in this clinic are no more favorable than observed elsewhere. It is believed that the current policy should be conservative in regard to the use of nitrogen mustard in the treatment of Hodgkin's disease If the patient responds well to radiation, this is believed to be the treatment of choice. Most climes have had wide experience with radiation and the beneficial effects as well as the limitations of this procedure are well known. Nitrogen mustard on the other hand is a new drug and demands continued and extensive trial before adequate evaluation of it will be possible. It appears to be an adjuvant in selected cases, in others it may replace radiation when the patient becomes so-called radiation resistant.

The use of nitrogen mustard in other conditions in this clinic has been very limited. patient with multiple myeloma appeared to receive no benefit. The patient died a short time later and at postmortem examination no pathologic findings attributed to this new drug were observed. One patient recently admitted for lymphosarcoma was given the drug with no greater effect upon the glands than would be anticipated from radiation A third patient with mycosis fungoides has had two courses of nitrogen mustard with improvement of skin lesions following each course. Its use in polycythemia vera is looked upon with skepticism in this Spray radiation with or without an occasional venesection is considered to be an effective form of treatment of this malady hence our preference for those relatively safe procedures in comparison with the use of a highly toxic substance

#### Summary

An abstract of each of 6 patients with Hodykin's disease has been presented In addition to the frequent occurrence of the accepted criteria of this malady, i.e. generalized lymphadenopathy hilar and mediastinal hypertrophy by x-ray examination, cutaneous manifestations fever, weakness, malaise and weight loss, each of the patients presented one or more unusual features The first patient had a mild form of the disease incidental to chronic valvular heart disease The second patient had Kapon s skin sarcoma prior to the detection of adenopathy The third patient had severe secondary anemia and at postmortem examination had extensive bone marrow infiltration. The fourth patient had pruntus and other akin symptoms before adenopathy The fifth patient had what appeared to be primary liver and spleen disease while the sixth patient had a high circulating eosinoplulia

Each of the patients was treated with rada tion. Two of the patients had one course of introgen mustard in addition. Other patients with Hodgkin's disease and patients with other diseases have been given nitrogen mustard also in recent months. No greater benefit has been observed following the use of nitrogen mustard in this hospital than has been observed in a larger series of patients in other clinics and no greater effects were observed in this hospital than have been observed in patients receiving radiation

# CIRRHOSIS OF LIVER NOT SYNONYMOUS WITH ALCOHOLISM

A serious disorder of the liver, known as cirrhosis. has been persistently identified as alcoholic in origin Three Philadelphia doctors suggest in the interest of scientific accuracy "that all reference to any type of cirrhosis as 'alcoholic cirrhosis' be abandoned.

Despite the progress of medical science in recent years in the study of the origin of cirrhosis of the liver, "its cause and mode of development continue to remain part of the mysteries of medicine," according to Drs Russell S Boles, Robert S Crew, and William Dunbar, from the Medical and Pathological Departments of the Philadelphia General Hospital, writing in the June 21 issue of the Journal of the American Medical Association

Portal cirrhosis, the type most frequently found in this country, is generally accepted as being synonymous with alcoholic cirrhosis, state the authors In the portal area is a branch of the portal vein which drains the blood from the intestinal tract the portal vein becomes obstructed by degenerate cells which are replaced by scar tissue, increased pressure is necessary for forcing blood through the liver

This leads to disastrous conditions such as profuse bleeding, jaundice, and swelling of the abdomen and later the legs

The authors present an analysis of 3,637 postmortem examinations made between 1942 and 1946 In this group, 142 cases of portal cirrhosis were It was possible to obtain an accurate history concerning the use of alcohol in 64 of the 142 cases Fifty were alcoholics and 14 claimed total abstinence In the remaining 78 cases there was either no record of indulgence in alcohol, or the his-

tory concerning its use was questionable
"It is significant that in younger persons with cirrhosis, namely those under 40 years of age, nine of 13 admitted heavy drinking," the authors point out Alcoholism is thought to contribute to the produc-

tion of cirrhosis of the liver because it is believed that the alcoholic never eats enough and therefore does not get the essential substances, or if he does take food he does not digest and absorb the needed factors

On the other hand, the authors cite the theories of other investigators who believe that cirrhosis of the liver may be caused by intestinal bacteria following intestinal irritation from alcohol, acid fermentation or some other agent, allergic reaction resulting in shock, the result of repeated injection of egg white or other protein and bacterial infections combined with poisons that are toxic to the liver

# NEW DIRECTOR OF RED CROSS BLOOD PROGRAM

Vice Admiral Ross T McIntire, wartime surgeon general of the US Navy and formerly White House physician, has been named director of the new National Blood Program of the American Red Cross

Recently approved as a Red Cross activity by its Board of Governors, the long-range program contemplates the provision of blood and its derivatives,

without charge for the products, to the entire Nation

President O'Connor explained that Dr Foard McGinnes, operating vice-chairman of Services of the American Red Cross, who has been instrumental in the origin and development of the project, will continue to have over-all responsibilities for the organization's medical services

# ICE BREAKER

A young woman doctor in my husband's office was eager to ingratiate herself with her colleagues One morning she came across a reprint on a pet subject of one of her male confreres In a fever to please, she phoned to say she was sending him an article that was right up his alley

Next morning the article came back with a note saying, "I didn't know you cared!"

She had sent him, not the intended material, but another reprint, entitled "Use of Androgen in Cases of Impotence "-Medical Economics, June, 1947

### OFFICE MANAGEMENT OF THE NEURODERMATOSES

GEORGE M LEWIS MD, and FRANK E CORMIA MD, New York City

(From the Department of Medicine (Dermatology) Cornell University Medical School and the New York Hospital)

THE concept of psychic factors in association with certain diseases of the skin is generally accepted. In a few syndromes such as dermatus factuta the psychogenic origin is self evident. In some cutaneous disorders the only disturbance in the central nervous system is a consecutive one due to associated pruntus disability, or disfigurement. The role of the psychic as a major or minor causative factor in other skin diseases, loosely grouped as the neurodermatoses, is subject to considerable discussion by dermatologists. It is our belief that psychic trauma or conflict are important etiologic factors in the production of this latter group of diseases

Notwithstanding the increase in knowledge of the internal forms of psychosomatic disease little progress has been made in the interpretation and management of the cutaneous manifestations. The lack of progress may be considered due to several reasons, of which the following seem important

or milit

1 The traditional symptomatic approach

2 The heavy office schedule of many derma tologists who are apt consequently to overstress the some and minimize the psyche

3 Lack of understanding of the various types of the neurodermatoses

4 Lack of comprehension of the principles and technics of investigation

5 Misleading information in some current texts and articles

In this paper, information regarding the mechanisms in the production of derinatoses will be presented, for unless the basic mechanisms are correctly interpreted, the rate of cure will be low and the percentage of relapse high. A method of approach which has proved of value in over 100 patients will then be submitted and some of the difficulties encountered and successes achieved will be summarized

# Classification of the Neurodermatoses

- A. Dermatoses always psychic in origin
  - 1 Dermatitis factitia (artefacta)
  - 2 Neurotic exconntions
  - 3 Trichotillomania
  - 4 Acarophobia
- B Dermatoses always psychogenic but often with additional etiologic factors as well
- Presented at the 141st Annu I Meeting of the Medical Society of the State of New York Section on Dermatology and Syphilology Thursd y May 8 194

- 1 Lachen simplex chronicus (localized neu rodermatitis)
- 2 Acute neuroxlermatitis
- C Dermatoses frequently but not always psychogenic in origin
  - 1 Pruntus
  - 2 Alopecia arenta
  - 3 Urticana
  - 4 Hyperludrosis
  - 5 Vesiculo-bullous dyshidrosis of hands and/or feet
  - 3 Glossodynia (burning tongue)
- D Dermatoses combining psychogenic and other etiologic factors
  - 1 Atopic dermatitis (disseminated neurodermatitis)
  - 2 Rosarea
  - Synergism with sensitization dermatoses
    - (a) Activation of latent dermatophytid
       (b) Contact dermatitis
    - (c) Dermatitis medicamentosa
- C Dermatoses which may be aggravated by psychogenic factors
  - Seborrheic dermatitis
  - 2. Paoriasia
  - 3 Pitymasis rosea
  - 4 Miscellaneous

# Symbolism

Symbolism of lesions has been given emphasis in recent years by Weiss and English and others. For these investigators the character of the lesions and their location in the body are thought to have a special meaning. For example, Weiss and English consider that neurotic vomiting is an unconscious effort on the part of a patient to reheve himself of a disagreeable situation Simi larly hysterical blindness is the attempt to shut out unwanted sights MacKenna2 and others have suggested that the neurodermatitides may have a corresponding symbolic meaning cally, MacKenna refers to dyshidrosis of the feet and hands in a combat soldier as an unconscious rebellion against marching and firing a rifle Accordingly a comparative tabulation was made of the type and location of dermatoses and the underlying conflict in a series of over 200 patients with psychosomatic dermatoses. On the baus of these studies the following interpretation of data is submitted

A. As expressed by the type of lesion

 Pruritus (variably present in most psychosomatic dermatoses)

- (a) Localized and recurrent lichen simples chronicus, longstanding worry and anxiety with makeshift adjustments
- (b) Pruritus plus neurotic excoriations resentment against environment
- (c) Recurrent episodes of orginatic character sexual maladiustment
- 2 Paresthesias (acarophobia, glossodynia) phobias, usually of disease
- 3 Neurotic excornations (frequent accompaniment of pruntus) anxiety, desire for sympathy and attention, attempt to remove unsightly lesions from skin (i.e., acne), hostility reaction, at times in psychotic states
- 4 Dermatitis factitia (self-induced eruption)
  - (a) Severe maladjustment, often in hysterical types
  - (b) Antisocial and destructive tendencies,
  - (c) Narcissism and other forms of psychopathic personalities
- 5 Acute exudative neurodermatitis of flush areas severe anxiety, acute or prolonged unsolvable conflicts
- 6 Atopic dermatitis (disseminated neurodermatitis) prolonged social resentment, hostility, compensatory aggression
- 7 Urticaria acute phobias with anxiety, hostility, and anger
- 8 Rosacea inferiority and self-consciousness, prolonged social anxiety
- 9 Hyperhidrosis insecurity or fear, prolonged social anxiety
- B As expressed by localization of lesions
- 1 Scalp (alopecia areata) inadequacy, acute shock with insecurity
- 2 Head (rosacea, seborrheic dermatitis, eczematous ear) social anxiety, stigmatization, guilt
- 3 Blush areas (acute neurodermatitis, rosacea) guilt, social anxiety
- 4 Hands and feet (pompholyx) dislike or fear of occupational duties
- 5 Penis or vulva (pruritus, lichenification, eczematoid dermatitis) sexual disturbances
- 6 Scrotum (lichenified eczema) domestic and sexual conflicts, maladjustments or frustrations in these spheres
- 7 Anus (pruritus, lichemification) sexual or domestic conflicts, severe anxiety in "anal" types, homosexual tendency in men
- 8 Generalized severe anxiety or maladjustment involving entire environment

# A Method of Psychosomatic Investigation

The psychosomatic investigation utilizes both objective findings and anamnestic data for the interpretation of underlying causative mechanisms. Valuable information may be obtained by careful study of the eruption as mentioned under symbolism. The line of questioning then may be somewhat predetermined and valuable time saved. As a background for the development of the eruption, the adjustment of the individual in his progress through life is first considered. The

behavior pattern of the individual and the salient personality features then are compiled over, previous studies have shown that the type of dermatologic reaction is dependent not only on the specific behavior patterns but, also, on the nature of the precipitating episode From this information, the probable reaction of the individual to various situations and specific conflicts It is important to determine may be adduced the life setting of the individual just prior to the onset of the present illness Finally, the onset, development, and progression of the present illness should be correlated with specific precipitating incidents in both the somatic and psychic realms

# Outline

- 1 Initial Summary of objective features of dermatosis
- 2 Preliminary Investigation (if indicated) to rule out other causative factors
  - 3 Family History
  - (a) Parents personality types, general adjustments, marital history, strictness emotional relationship of patient with parents Physical diseases, age at death, and age of patient at death of parent
  - (b) Siblings number, sex, chronologic position of patient, physical diseases
  - (c) Nervous breakdowns, etc
  - 4 Health Record
  - (a) Diseases, general physical status, injuries, reaction of patient to diseases Pseudohereditary tendencies (symptoms, etc., similar to those of parent)
  - (b) Addictions tobacco, alcohol, need for drugs
  - (c) Dreams type and frequency
  - (d) Neurotic traits nail-biting, thumbsucking, bedwetting, tantrums, lying, or stealing, late fears, compulsions, or tensions
- 5 General Adjustment Chronologic story of life, taken up under several headings, as follows
  - (a) Family life childhood, adolescence, and adult life, with relationship to parents and siblings
  - Education details of, interest in, progress, relation to teachers and schoolmates
  - (c) Social life adaptability, friends, hobbies religion
  - (d) Work record details, interest, and progress, stability, income
  - (e) Sexual life development, adult pattern, necessity, normality (escape mechanism?) Details of marital life including engagements, marriage, and divorce
  - 6 Behavior Pattern
  - (a) Dominating or submissive
  - (b) Goals in life

- (c) Emotional trends cheerful depressed, unstable, etc.
- (d) Introversion or extratension (motivating stimuli from within or without)
- (e) Constricted or dilated personality
- (f) Reaction to authority thinking talking out troubles, substitute activities active aggression
- (g) Personality type compulsive anxiety, hysteria neurasthenia, psychopathic
- Preparation for Illness

Correlation of prolonged conflicts, life situation prior to onset, with type of individual in his life setting

- 8 History of Present Illness
- (a) Chronologic correlation of stresses, strains traumatic events, and subsequent conflicts with appearance and progression of present condition
- (b) Purpose served by symptoms
  - Symptoms as an expression of and defense against conflict
  - 2 The idea of compensation, escape from unpleasant duty
  - 3 Centering of attention on inadequate
- (c) Reactions to present illness enjoyment, fear, rain, and discomfort
- (d) Amount of associated neuromuscular tension dreams
- (e) Insight into present condition, will to

### Clinical Data

The clinical study of patients as outlined above has been carried out with both office and dispensary patients. In this communication a summary is submitted of the case records of 36 patients studied in private practice. Several illustrative case reports will be given in detail This series represents the more difficult psychosomatic problems encountered in one year of office practice during which time approximately 1 000 new patients were seen. The patients ranged in ages between eight and fifty nine the average age at onset of the disorder being forty-There were 19 women and 17 men. In general it was noted that private patients were more difficult to manage and had a higher per centage of compulsion types of personality as compared with the more amenable anxiety type commonly seen in clinic patients.

Furthermore aggressiveness, self-esteem and egoism were more prominent traits with more resistance to adjustments of fundamental conflicts. These patients had greater will power and consequently were able to submerge their conflicts to a subconscious level, which in turn

resulted in increased resistance to therapy Finally, they seemed to exhibit a more diverse fied type of reaction with frequently two or three different psychosomatic manifestations. It is of interest that lichen Vidal, neurotic excorations. and rosacea, common manifestations of anxiety, were more common in clinic patients, whereas pruritus ani, dyshidrosis and "neurogenous cars," in which multiple factors are frequent. were seen more often in private practice. In the early life of most of the patients problems in adjustment and personality development were prominent. Consequently, personality disorders were common and the patients as a group were unable to cope with specific conflicts which occurred in adult life Excessive aggressiveness and a frequently strict religious background combined to produce more conflicts in the sexual sphere than were present in the chine group

Of the 36 patients the cutaneous reaction types are listed in Table 1—It is of interest that multiple manifestations were present in 30 per cent of the patients fifty individual dermatologic complaints occurring in the entire group

TABLE 1-DISTRIBUTION AND FREQUENCY OF DERNATORES

IN 30 PATIENTS				
Reaction Type	Frequency			
Pruritus ani	11			
Lichen Vidal	5			
Urticaria	5			
Neurogenous ears	4			
Dyshidrosis	4			
Venrotic excoriati ne	3			
Pruritus vulvae	3 2			
Scattered pruritue	3			
Ecsematold dermatitle	3			
Al pecia areata	3			
Seborrheio dermatitio	2			
Trichotillomania	1			
Acute neurodematitis	1			
Rosacea	1			
Dermatitla factitla	1			

In many instances it was difficult to determine the personality type and predominant emotional reactions of the patient since anxiety and tension states frequently coexisted to varying degrees, depending on the individual attuation Definite compulsive-obsessional tendencies were noted in 11 instances, while anxiety to some degree was present in 18 patients. Depression combined with neurasthenia was determined in 4 patients A history of childhood maladjustments was obtained in two thirds of the patients A history of psychic trauma as a precipitating factor was absent in 17 patients Physical and endocrine precipitating factors occurred in 8 individuals Precipitating factors of any type were not discovered in 11 of the patients.

On the other hand fundamental maladjustments and multiple conflicts were active over many months or years in all but 3 patients in two of these psychosomatic investigation was incomplete because of poor cooperation. In general, the maladjustments and conflicts were of a diverse nature Specific sexual conflicts were present in only 25 per cent

# Getting the Patient Well

From the foregoing, it is evident that the problems presented by these patients are individual and that prolonged, painstaking therapy As would be expected, it was found is required that the best results were obtained when therapy included both physical and psychic measures The purely symptomatic approach, eg, \radiation for lichen Vidal or pruritus ani, while of undoubted value in the amelioration of symptoms, did not correct the underlying problems In these instances the almost inevitable result was a subsequent relapse, the development of a related or different type of neurodermatosis, or psychosomatic complaints involving other body structures Accordingly, treatment of physical and endocrine abnormalities was accomplished in conjunction with measures designed to correct the underlying maladjustments and conflicts It was possible frequently, over a period of weeks, not only to obtain the confidence and cooperation of the patient, but also to make helpful suggestions toward the solutions of the individual difficulties

The following case histories are cited as illustrative of some of the problems encountered and the results achieved

# Report of Cases

Case 1—R P, a Jewish-American fur-broker, aged 43, had been bothered with pruritus ani for four years. A preliminary history and appraisal did not reveal any obvious physical or constitutional diseases, but a nervous breakdown, six years previously and subsequent prolonged psychotherapy suggested the need for a psychosomatic investigation

The early family life was unsatisfactory, the parents getting along poorly tog ther, consequently, the home atmosphere was one of tension, insecurity, and distrust. This led to the development of pay-

choneurosis in two siblings

The health record included a severe asthma, beginning ten years previously and ostensibly due to fur allergy. This disease was pseudohereditary, the mother having had asthma for many years. Eliminations of allergens and injection therapy were valueless, the asthma finally involuting as a result of prolonged psychotherapy while he was in continued contact with furs. Indefinite gastrointestinal complaints accompanied the first nervous breakdown. The patient was an inveterate smoker. Early neurotic traits were not clinically manifested, but fears, compulsions, and tensions became evident during and after adolescence.

His general adjustment through life was beset with many difficulties. Always a sensitive, introspective child, he was forced to witness, between the

ages of three to four, his parents in the act of sexual intercourse He was terrified by these experiences. feeling that his father was overbearing and cruel to his mother, to whom he was closely attached Hatred and fear of his father and of his big penis. and excessive dependence on his mother soon resulted in insecurity and inadequacy, which has since influenced his school, social, sexual, and work life As a result of this, he acquired three college degrees and developed an outward harshness and overbearing demeanor Because of an excessive mother attachment his early experiences with women were in frequent and casual He finally married at thirtysix, but the latent homosexual trends have continued Throughout his life, until recently, tension and anxiety were relieved by masturbation, in occasional heterosexual experiences he was relatively ımpotent This impotence (imagined lack of masculinity) continued on into his marital life until finally cured by psychotherapy — In the work sphere he felt insecure and inferior to his fellowmen, as a consequence he suffered the "tortures of the damned" in his business relationships, especially in conferences or important business dealings

The behavior pattern revealed a compulsive type of individual, with marked anxiety and instability Compensatory domination and introversion were present, he was relatively constricted. His reaction to authority (man) was either by thinking out troubles or by active aggression, depending upon the state of his ego at the moment and the type of man with whom he had to deal

The preparation for illness was in the period following a second nervous breakdown, and, at the time, he was gradually recovering from his more deep-scated difficulties (acute psychoneurosis, asthma, impotence) as a result of psychotherapy The pruritus ani, then, may be regarded as a superficial somatic defense against the residuum of his deep-seated conflicts and, as such, a way-station on the road to cure It is significant, also, in its symbolism of his predominant maladjustments pruritus was expressive of anxiety The location symbolized his latent homosexual tendencies, and its character was clearly of a masturbating type, indicating a residual need for immature autosexual ac tivity to relieve business tension and insecurity, and to express his latent distaste for heterosexual expression

The patient was seen over a period of eight months, first at weekly and then at more infrequent intervals. X-ray treatment was administered, concurrently, the nature of the new development was gradually revealed to him, and continued encouragement and practical suggestions given. After some twenty visits the pruritus had practically disappeared, he faced life with relative equanimity and continued to make an increasingly better adjustment to his problems.

Case 2—T P, aged 36, a laundry-operator of Maltese extraction, had been bothered with severe urticaria for two weeks—Inquiry regarding drugs, allergic contacts, and foci of infection yielded negative results—The past history was not completely evaluated but the patient was of a compulsive-

obsessional type chromically overworking for many years. In the past two months excessive business wormes developed. One week prior to the onset of the urtlearia, he became the intended victim of an underhanded business deal which if successful might have had disastrous consequences. He became greatly incensed at this development and twas in this setting that the urtlearia developed

Benadryl therapy was administered and tho mech anism underlying the production of the lesions out lined to patient Cure was rapid and uneventful

Case 3 -D E a housewife aged 50 was raised in an irresponsible and somewhat neurotic family Consequently she had to assume extra responsibilities at an early age partially supporting three indolent brothers and an alcoholic father Because of these circumstances a long-cherished wish for an advanced education was denied her She became happily married at 26 and got along well until she was forty four at which time her husband went into bankruptey and the patient again was shouldered with heavy responsibilities. During this period a large patch of lichen Vidal developed on the kit knee and upper leg, with final involution three veurs later with improvement of business. How ever she continued to work to help out the family finances During the following year she was transferred to a new position which entailing as it did the shouldering of responsibilities of others in social work, was distasteful to her At this time circum scribed lichen Vidal began on both palms and on ankles She continued the same work until recently and during this entire time was plagued with the itching dermatosis. More recently it has been aggravated by the impending breakup of her daughter a marriage and her return home (more responsibilities)

The cruption was temporarily improved five years previously by a long series of x-ray treatments Endocrine antiprinrite and soothing remedies were prescribed at this office, with considerable temporary improvement. She has been persuaded to give up work and live at home measures to lessen her responsibilities have been suggested. A permanent cure, however is hardly to be expected except with much closer supervision and cooperation than is likely to be obtained in this particular situation.

Case 4.—A B a marine sea captain aged 43 has had an intractable pruritic eczematoid dermatitis of both external cars for four years and an equally severe pruritus am for one year. He had an unfortunate childhood life his father being a psychopathic personality (vagrant) and his brother a chronic alcoholic Consequently he loved his mother and hated his father. He was a shy and retiring child because of physical disabilities as a result he has made but few friends and then only with difficulty He left school after the seventh grade and for twenty years drifted from one job to another mostly in a laboring capacity. In the past five years his past experience as a merchant seaman allowed lum to rise rather rapidly to his present station

His personal and sexual life have not been satisfactory. Physically health, he has been subject to many injuries and at least five serious fractures.

(fracture personality of Dunbar) Sexual experiences to lum have always been a method of working off tension and an excape from the daily banality and frustrations of life. He has been intimate with at least twenty five women and has had four mistresses since his marriage seven and a half years ago. His wife is a heavy drinker and is abnormal in that she does not wish to have children. She has already had two induced abortions. These traits led to considerable domestic conflict.

During the past few years the patient has tended to setth down and has assumed more and more of the responsibilities of adult life. It was during this period of his transition to a more stable, conventional type of life and while he was on a visit to his wife that the neurogenous cars developed. As such evidence of a definite guilt complex could be determined. The pruritus aim on the other hand doveloped during a period of sexual abstinence, while at sea and it is of interest that a masturbation pattern could be identified.

The patient was seen over a number of weeks radiation was administered and some attempt was made to explain the underlying mechanisms involved. However he left for another city before therapy could be completed and a recent letter from a colleague states that the complaints are still present with undiminished intensity. Clearly prolonged revelotherapy is needed in this case

Case 5 - J S a 52-year-old clerk, had had pruntus and neurotic excoriations of the face for some fifteen years The eruption was complicated by secondary pustular folliculitis on a number of occasions and by a severe attack of edematous and plaque dermatitis from penicillin The patient was of Scotch Irish origin, and was brought up in a lower middle class environment and in a rather closely knit family He was closely attached to his mother and depended to a considerable degree on her did moderately well in school but was not particularly ambitious leaving college to take a job in a brokerage house He had occasional sexual experiences with women beginning at the age of twenty but it is significant that he never became seriously interested in the opposite sex until shortly before the death of his mother when he was thirty-seven He marned the following year and made a satisfactors social and sexual adjustment to marital life

However his financial status has remained in a precarious state throughout his married life. He has held a minor administrative job with just sufficient funds on which to live, until his wife con tracted a severe illness four years ago with a partial residual incapacity to date. Since her illness he has incurred substantial debts and his had a difficult time maintaining a home for his young son. During this four year period it has been necessary for his wife to spend months at a time with her parents, so that special care could be given. He lived alone during much of this period.

The pruritus and excenations were first noted shortly after the death of his mother at which time he was first compelled to assume the normal responsibilities of manhood. The trouble continued for the most part in mild form through the years

It is noteworthy, and possibly related to his longstanding mother-fixation, that the condition was not aggravated during the acute serious phase of his wife's illness Six months ago, and for the first time in years, an opportunity arose for him to better himself with a position which combined a significant increase in salary with corresponding increase in re-During this period of uncertainty sponsibility while the applicants were being considered, he exconated his face so severely that he was automatically eliminated as a possible candidate for the Secondary infection and reactivity to penicillin then supervened and investigation and treatment were initiated

1894

He was followed over a period of some three months. Initially he was convinced that his complaints were solely physical in nature, but as time went on the relationship between the longstanding anxiety-state and the development of the lesions became increasingly evident to the patient. Involution was nearly complete and a more satisfactory adjustment to the conditions of his life had been obtained at the time of his last visit.

Case 6—H F, aged 44, developed severe bald areas in his scalp and bearded region during the past six months

The family and early life history were negative. the only significant finding being that the mother was a nervous, excitable type The patient was a self-made man He began work after completion of high school, starting in a minor capacity but gradually advancing himself, by dint of continued application and conscientiousness, to positions of increasing responsibility One and one-half years ago his steady advance was temporarily sidetracked by a position which made great demands on his time but which offered little chance of advancement opportunity, which he felt eminently qualified to fill, became available about a year ago However, due to favoritism and company politics he was bypassed by one of his own subordinates

Since that time he has developed a definite sense of inferiority with regard to his position and in his relationship to his fellow employees. He has found it difficult to face his friends and became so agitated and anxious that he developed insomnia and found it impossible to relax. Just prior to the onset of the present trouble he managed to control his active resentment and "put the whole business out of his

mind" It was at this time that the alopecia was first noted, as such, its development may be construed as a somatic substitute for the free-floating anxiety and resentment which formerly were present. The continued development of new lesions until the time of his first visit to the office may be explained on a similar basis.

The patient is still under observation but no new area of alopecia has developed and some regrowth has already occurred. The nature of his problem has been explained to him and to date he has made a very satisfactory readjustment.

# Summary

An office technic for the management of the neurodermatoses is outlined This embraces a preliminary appraisal of the patient to exclude primarily physical diseases or to evaluate their relative importance in the causation of the presenting disease A special investigation is then documented and the details are exempli-It should be fied by illustrative case reports emphasized that these procedures, while not as time-consuming as psychoanalysis and related technics, cannot be effective with brief con-With the combined psychosomatic and symptomatic methods of therapy, the results of treatment were decidedly good, 50 per cent of the group being cured or markedly improved, while 22 per cent were slightly or not improved The remaining 28 per cent lapsed from observation, of these, 14 per cent may be considered as complete failures, while the other 14 per cent were seen only in consultation or have moved from the neighborhood

While the management of the neurodermatoses is still difficult and the results uncertain in many instances, it is hoped that the methods of interpretation and therapy advocated in this paper will be of practical value to the dermatologist

# MEDICAL PUBLICATIONS NEEDED OVERSEAS

As a result of war and persecution, doctors, dentists, and technicians in allied fields throughout Europe have been deprived for more than ten years of news of the latest developments in their professions—the kind of news and analysis contained in this JOURNAL

When you have finished this issue, put it to work by sending it to the SOS (Supplies for Overseas Survivors) Collection of the Joint Distribution Committee, 1539 Troy Avenue, Vanderveer Park, Brooklyn, New York

Brooklyn, New York

It will be placed in a library in a DP camp, child-care center, hospital, or school for use by professionals desperately anxious to bring themselves up to date on the knowledge forcibly kept from them by the Nazis

### MYOCARDITIS IN MALIGNANT TERTIAN MALARIA

IRVING GREENFIELD, M.D. FACP Woodmere, New York

ACUTE MI OCARDITIS occurring during the course of Plasmodium falciparum malaria was sufficiently unusual to warrant the following case report

A 22 year-old marine was admitted to the Eighteenth Station Hospital in November 1943 dur ing his fourth attack of malana. P falciparum was identified on examination of the blood amear. He responded well to the routine atabrine regimen Because of the fact that a regularly recurring pulse irregularity noted on admission persisted after clini cal improvement in his malaria had occurred he was sent to another hospital where facilities for more

complete study were available.

Physical Examination - His height was 70 inches weight 155 pounds pulse 60 and the blood pressure weight 155 pounds place of and the hood pressure was 120/80. The patient was an asthenic normally developed white man The heart was not en larged. \( \) shocks or thrills could be palpated over the precordium. Premature beats recurring regularly following each fourth normal heart beat were palpated at the apex. Each premature beat was followed by a compensatory pause heart sounds were of fair muscular quality The aortic and pulmonic second sounds were normal. A soft short, crescende type of systolic murmur was audible at the apex. It was sharply localized and was present in all positions as well as following exercise. Although the cardine rate was markedly accelerated following exercise the quintigeminal rhythm persisted. The remainder of the examina tion was normal.

There were no abnormalities of the cardiac ailhouette An electrocardiogram taken on December 15 1043 revealed that the PR interval was 0 32 Premature ventricular contractions of second. right ventricular origin occurred regularly following each group of four normal complexes. The reeach group of four normal complexes. The mainder of the electrocardiogram was normal. diagnosis of first-stage heart block and of quniti-

geminal rhythm was made.

The past history revealed recurrent sore throats and uncomplicated scarlet fever in childhood After the age of ten, however his health was unusually good In December 1942 in February, 1943 and again in April, 1943 he had clinical malaria. In October 1943 he had a sore throat, it lasted a few days and was so mild that he did not report on sick call During the course of the third attack of malaria, which occurred in April, 1943 he was aware of the fact that his heart turned over occasionally There is no mention made in any of the previous hospital records that a cardiac ar rythmia was noted At first these peculiar sensations' occurred infrequently Later on, they recurred up to several times daily Occasionally they were accompanied by light-headedness." spite of these facts he never reported them on sick

The patient remained afebrile following the

Norz: The author wishes to express his thanks to Lt. Co. Leo Peterson, M.C., for his succurragement. Photographic reproductions of the selectrocardiographic thanks admissed would have been desirable. However under combat conditions, this was not possible.

course of atabrine His only complaint was that he was aware of an extra heart beat. An electrocardiogram taken seven weeks after the first one reported above revealed that the PR interval was 0.28 second The quintigeminal rhythm remained With continued bed rest because of unchanged case of fatigue, the patient continued to improve After ten weeks the PR interval returned to within normal limits of 0 18 second There was no change in the quintigeminal rhythm. At this point, the patient was evacuated from the tropics.

#### Discussion

In the absence of autopsy investigation one must speculate concerning the nature of the pathologic process which was responsible for the above-noted clinical observations. With this in mind, it is of interest to consider the role which the malaria para

site played.

Malaria is a disease which is characterized by recurring attacks of fever If untreated, there is deposition of a black pigment in the organs of the Brown<sup>2</sup> suggested that this malaria nig ment acts as a hemolysin which by its destructive action on endothelial cells may be responsible for capillary hemorrhage A second pigment hemosid erin also may be seen in the lumina of capillaries either partially or completely occluding them. In intense infections it is not uncommon to find the lumina of capillaries occluded with thrombi made up of pigment red cells phagocytic cells cellular debris and free parasites,\*

Auriculoventricular block is the term employed to designate interference with the passage of an impulse from the auricle to the ventricle. Injury to the cardiac musculature may be responsible for a prolongation of the conduction time. The injury may be mechanical, chemical, or toxic. Thrombi such as those mentioned above are not uncommon in sections of the endocardium as well as of the myocardium of individuals who succumb to infection with malignant tertian malaria.

The only other agent which might possibly be suspected is the atabrine which the patient took as a suppressive as well as a therapeutic drug. The studies of Heimann and Shapiros have shown that atabrine affects the amplitude of the complex as well as of the T wave. It, therefore is reasonable

to dismiss that drug as an etiologic agent.

Premature vontricular extrasystoles are probably the most common of all of the cardiac arry thmias, Most often they pass unnoticed. Hyman called attention to the fact that their mechanism is still obscure. Ungeleider and Gubner concluded that their persistence increases their significance. On the basis that the premature ventricular extrasystoles permsted for at least six months as well as the fact that the quintigeminal rhythm did not alter following exercise, it is suggested that the arrythmia noted in the case herein reported resulted from an organic rather than from a functional disturbance.

Soc 41 1 (1942)

# Summary

A patient developed heart block and quintigeminal rhythm during the course of malignant tertian malaria. In the absence of any other known etiologic explanation, it is suggested that these conditions were the result of localization of the parasite and of its products in the vessels of the endocardium and of the myocardium

# RESEARCH FELLOWSHIPS-THE AMERICAN COLLEGE OF PHYSICIANS

The American College of Physicians announces that a limited number of fellowships in medicine will be available from July 1, 1948, to June 30, 1949. These fellowships are designed to provide an opportunity for research training either in the basic medical sciences or in the application of these sciences to clinical investigation. They are for the benefit of physicians who are in the early stages of their preparation for a teaching and investigative career in internal medicine.

Assurance must be provided that the applicant

will be acceptable in the laboratory or clinic of his choice and that he will be provided with the facilities necessary for the proper pursuit of his work. The allowance will be from \$2,200 to \$3,000

The allowance will be from \$2,200 to \$3,000 Application forms will be supplied on request to the American College of Physicians, 4200 Pine Street, Philadelphia, 4, Pennsylvania, and must be submitted in duplicate not later than November 1, 1947

Announcement of the awards will be made as promptly as is possible

# ANNUAL MEETINGS OF THE DISTRICT BRANCHES-1947

Thursday, September 25, Seventh District Branch, Veterans Administration, Bath

Tuesday, September 30, Fifth District Branch, Utica

Wednesday, October 1, Eighth District Branch, Jamestown

Wednesday, October 15, Sixth District Branch, Norwich (Arrangements have been made for State Society Officers to stay at the Hotel Chenango, Norwich, after meeting of Sixth District Branch)

Supplementary Report of the Council-Part XII Miscellaneous

Nursing -The meeting of the Coordinating Council on Nursing Problems held on April 17, 1047 was devoted largely to consideration of the recruitment and training of practical nurses. It was pointed out that the distribution of the fourteen registered schools for practical nurses in New York State is not good-there is one such school in Rochester one in Albany, and the rest are in New Schools are needed in Lrie Onondaga Chenango and Queens Counties The schools for professional nurses are not filled and it was sug gested that some of these schools might profitably be changed to schools for practical nurse training

A motion was adopted
"That this Coordinating Council on Nursing Problems push a practical nurse recruitment and education program and recommend improvements as indicated

The need for male as well as female nurses was stressed.

The following resolution was adopted

'Whereas there is a widely recognized need for practical nurses in New York State be it

Resolved, that this Council request suggestions from the Medical Society of the State of New York the New York State Hespital Association the New York State Nurses Association the Practical Nurses of New York, Inc. and the New 1 orl State Committee of the National Association for Practical Nurse Education for a professional and practical nurse education program further

Resolved, that these groups be asked to make suggestions for a recruitment campaign

It was voted that the Practical Nurse Associa tion be invited to full voting membership in the Coordinating Council on Nursing Problems

Memorial.—Dr James Murray Flynn

Whereas our friend and colleague, James Murray Flynn, after years of loyal service to his beloved profession died on Saturday, December 14

WHEREAR his was a colorful career—roentgenologist soldier, leader in organized medicine ability in his chosen field of roentgenology was un challenged and his long years of service as chief of the x ray departments in various Rochester hospitals brought a feeling of great comfort and security to these institutions and to their patients whom he served and

WHEREAS, he served with distinction in his special field with Base Hospital No 10 during the entire period of the First World War and

Whereas in his passing, organized medicine loses a staunch worker loyal friend, and dis-tinguished leader He was President of the Medi cal Society of the State of New York in 1940. prior to that he had been President of the Medical society of the County of Monroe and also of the Rochester Academy of Medicine, indicating the high esteem in which he was held by his brother practitioners and

WHEREAS, his vigorous mannerisms so characteristic of him covered a sympathetic and under standing nature and over the years he became the friend and confidant of countless physicians and

Whereas he was a stalwart champion of the rights of the medical profession, jealous of its honor and exemplified its duties and responsibilities in his own daily conduct and

Whereas his religious real and devotion to his family were well known and he leaves an honored name to those who survive him therefore be it

Resolved that the membership of the Medical Society of the State of New York loses a distinguished servant in his passing, and mourns our loss and be it further

Resolved, that these resolutions be published in the New York State Journal of Medicine and

that a copy be sent to Mrs Flynn

Belated Bills.- A bill of \$54 00 for expenses in curred by a member of Dr A H Aaron a committee in attending meetings of the Subcommittee on Medi cal Expense Insurance of the Committee on Public Relations and Economics This bill was recently received more than thirty days after the date of incurring of expenses and more than the additional sixty days later which the Board of Trustees are permitted to allow under Chapter 9, section 1 of the Bylaws Therefore the bill is submitted to the House of Delegates for authorization of payment

Section 17 (See 105)

#### Supplementary Report of the President

Speaker Andresen The Chair will now recog nize Drs Curphey and Van Kleeck of Nassau, who

will bring Dr Bauer our President to the platform
The delegates arose and applauded as Drs
Theodory J Curphey and Louis A. Van Kleeck, of assau County escorted Dr Louis H Bauer to the platform

SPEAKER ANDRESEN Have you anything to add Mr President? to your report, Mr President?

I RESIDENT BAUER | Yes I have Mr Speaker

Mr Speaker and Members of the House before I give my supplementary report there are two announcements I would like to make. One is that it seems there was a dog show in this building yester day afternoon and a dance last evening which broke up at 2 00 a m Our office force was unable to start to prepare this room for our use until 2 00 a m this morning, and I understand that three of Mr Anderson's assistants, Mr Marshall, Mr Neilsen, and Mr Streit, put on their overalls and went to work themselves cleaning this place up, even removing whisky bottles from the telephone booths, so we could have our meeting here this morning. Therefore, if things were not quite in order when you arrived this morning vou will understand why. I think we owe a vote of thanks to those three gentlemen whose job of public relations hardly encompasses the matter of sweeping floors.

The other announcement I wish to make is that one of our most talked-of problems of the past year has been workmen's compensation. There has been, I think, a disposition on the part of some of our members to feel that the Workmen's Compensation Committee and the Workmen's Compensation Board had not been too energetic. I want to disillusion you on that, if you had such an idea. They worked very hard, and it has not been an easy task. If you read the newspapers this morning you will see that some of our problems have been solved. I understand that Dr. Dattelbaum will make a supplemental report on that this morning, giving you the details, so I will not take up any time in giving them to you now.

I had expected to appear before you at this meeting as your President-Elect and not as President The tragedy of Dr Hale's death catapulted me into the presidency without warning. As stated in my preliminary report, the Society has suffered grievous

losses during the past year

I feel, and I should like everyone to feel, that this is Dr Hale's meeting and not mine. We have tried to carry out that idea as far as possible. We have kept Dr Hale's name on the program, the Society stationery, and on the masthead of the JOURNAL On Wednesday evening the President's Medal will be given posthumously to Dr Hale and will be received by his son.

At this time I think it would only be fitting that we should rise in a moment of silent tribute to Dr

Hale

The members arose and stood with bowed heads in silent tribute to the memory of Dr Wilham

PRESIDENT BAUER This Society has suffered other grievous losses, which you all know about, and the House will have an opportunity to pay tribute to these men later when the memorials are presented

to the House

During the past year the medical profession of the country has been through a siege. The forces which would place medical care under a bureaucratic control succeeded in having public hearings on the Wagner-Murray-Dingell bill. Although these hearings were carefully staged to convince the public that there was a great demand for enactment of this bill, the hearings fizzled out and the Committee never nendered a report. Although up to the present no rew version of this bill has been introduced, there doubtless will be in the near future.

There have been introduced, however, two bills of interest, one the Fullbright-Taft bill and the other the Taft-Smith-Ball-Donnell bill These bills merit careful study The Fullbright-Taft bill calls for an Executive Department of Education, Health, and Security, with an Undersecretary in charge of each division The Undersecretary for Health must be a doctor of medicine While we approve of grouping all Federal Health activities in a single department, and approve of the head of that department being a

doctor of medicine, it seems probable that the Sccretary would come from the field of Social Security or possibly Education, and that Health would be the tail to the doc

The Taft-Smith-Ball-Donnell bill calls for the establishment of a National Health Agency outside of the Cabinet, with a doctor of medicine at its head This bill has been analyzed by the Planning Committee, whose report is in your hands. Hence, I will not take your time in discussing it, except to say that it offers a way of carrying out some of the ten points of the American Medical Association Program. While the bill requires some amendments, it is my belief that we can endorse the bill in principle

We must be forward-looking in our program We cannot wait for things to happen We must exercise leadership and guide the public Our voluntary plans of insurance, which are but one factor in an improved national health program, have progressed more rapidly the past year, but progress is still too

slow

Controversies between indemnity and service plans, and between nonprofit and commercial plans, must be eliminated. Whatever is best for the public must be our aim. The next few years will settle this matter once and for all, and our action must be

both progressive and aggressive

The bulk of the medical profession is not yet alerted to the importance of our planning. There is too much of a laissez-faire attitude on the part of a majority of the medical profession. We must arouse the interest of the individual physician and revitalize our county societies if we are to be successful County societies at present are too poorly attended Without the active support of the county societies, your state and national organizations are helpless. The most important thing this House of Delegates can do is for each delegation to take it upon themselves to make their county societies vital forces during the coming year.

Our State Society is constantly expanding its activities and doing a tremendous job for the public and the profession. To continue, it must have more funds or else it must become less active. I know of no active state organization whose dues are as low as ours. One state, for example, has annual dues of \$100. (Let me interpolate that the year they raised their dues to \$100 they had less people dropped for nonpayment of dues than in any previous years.) It is my considered opinion that our dues must be increased.

The loss of several active personalities the past year has caused me to give considerable thought to our official family. We must encourage younger men to take an active part and train them to take over the burdens which constantly are growing heavier. It is ten years since our present Council was established. At that time the Society was smaller by several thousand members. Since then, the House has added the Chairman of the Board of Trustees as a member of the Council, and last year added the Second Vice-President, the Assistant Sceretary, the Assistant Treasurer, and the Vice-Speaker. These were wise moves. They result in the Council's being of a size more in conformity with the size of the Society and yet not so large as to be unwieldy.

The Board of Trustees handles the finances of the Society, and its problems have steadily increased over the years. We have been most fortunate in that the Board has consisted of a long line of distinguished physicians and capable financial administrators. Probably the finances of no organiza-

tion have been better administered, nevertheless, in my opinion the size of the Board is too small considering the increasing number of financial problems it has to solve At one time during the past year there were but four members due to the death of one, and one of these four was away. That meant that two members could have decided a financial matter As a matter of fact, the decisions of the Board were unanimous and the vacancy was filled a month later It is not fair, however to the Board itself to place the responsibility of important financial decisions on so few nor is it sound ad We might not always be so fortunate ministration in the makeup of the Board hence it is my recom mendation that the membership of the Board be in creased to nine two to be elected each year for five years except every fifth year, when only one shall be elected. Since members of the Board are apt to be from among the older members of the Society as they should have experience as officers or as members of the Council before serving on the Board a slow but steady turnover seems advisable fore it is recommended that no member of the Board be permitted to serve more than two terms the system followed by the American Association in the election of its Board of Trustees and it has proved most satisfactory

The following amendments are therefore offered Article VI of the Constitution shall be amended to

read as follows

"The Board of Trustees shall consist of nine members elected by the House of Delegates in accord ance with the Bylaws The President the Secretary and the Treasurer shall sit with the Board of Trustees with voice but without vote '

Chapter III Section 3 of the Bylaws shall be amended to read as follows

"Two trustees shall be elected annually except every fifth year when but one shall be elected, each to serve for five years. In case of a vacancy a trustee shall be elected for the unerpired term, provided that at the session of the House of Delegates at which this amendment is adopted one rustee shall be elected for five years one for four years one for three years one for two years and one for one year, that at the next four annual sessions two shall be elected for five years. No trustee shall serve for more than two terms but a trustee elected to serve an unexpired term shall not be regarded as having served a term unless he has served three or more years.

These amendments of course cannot be acted on at this session and must lie over for a year before

they can be considered.

Once again, I wish to express to the House my appreciation of the great honor conferred on me a Year ago. I realize the tremendous responsibilities of the office which seem to grow greater year by year. I bespeak the cooperation and help of all the officers the Council, the Board of Trustees and every member of the House of Delegates. We have many problems beaetting us and we must all work together to solve them. I wish to assure you that I shall do my best to carry out the duties you have placed on my shoulders and prove myself worthy of your confidence.

SPEAKER ANDEREN Thank you, Mr President:
The President's Supplementary Report will be
referred to the appropriate reference committee and
the amendments which he proposed according to the
Constitution and Bylaws as he mentioned will lay

over and be taken up next year

Section 18 (See 15 126)

Second Supplementary Report of the Workmen's Compensation Committee—Part X

SPEAKER ANDRUSEN Under supplementary reports Dr Dattelbaum has a report from the Committee on Workmen's Compensation which he is

going to read in its entirety

DR MAURICE J DATTELBAUM Mr Speaker and Delegates because of the confidential nature of this report written by Miss Mary Donlon it was impossible to incorporate the contents in any report or even in a supplementary report for it was only to be released today Monday morning, May 5 1047 Thorefore in accordance with her request we could not release it prior to this time

Payment to 23 550 New York State doctors for treatment and care of disabled workers will be in creased annually over three million dollars as the result of increased medical fees in workmen s compensation cases just authorized by Miss Mary Don, Chairman of the State Workmen s Compensation Board Fees the doctors charge for office and home calls, as well as for hospital visits are raused in a partial revision of the workmen s compensation medical fee schedule which will become effective Jung 1, 1947

Statistical data of the insurance carriers indicate that approximately 60 per cent of all fees in work men a compensation cases paid to doctors author ized to render medical caro under the Workmen s Compensation Law in New York State, are paid for ordinary treatment given to compensation claimants in office and home calls and hospital visits

This is the first revision of those fees since 1938 Modical care is provided by employers and the lia billty for increased medical fees will fall on New York State employers and not on the disabled work

crs

For many years employers and carriers have been entitled to a discount of 5 per cent for payment of medical bills of \$15, or more when paid within thirty days after the bill was rendered. The State and County Medical Societies have opposed this discount and Miss Donlon announced that the discount would not be allowed on bills rendered on and after June 1 1947.

In making public the increase in medical fees Miss Donlon aise called attention to the importance of prompt filing of medical reports by physicians Because tardiness in complying with statutory filing requirement is a frequent and serious cause of delay and resulting hardship for compensation claimants Miss Donlon said, it seems wise to amend the rules to inform physicians specifically of the reporting requirements in workmen's compensation crases. By law severe penalties apply to physicians neglecting their obligation to file timely and full reports mamely revocation of authorization to treat work men's compensation claimants and inability to enforce payment of their medical bills

Proposals for increase in medical fees have been examined by a committee representative of all groups concerned in workmen's compensation in cluding employers carriers labor and organized medicine with Dr. Nathan B. Van Etten of New York City member of the State Industrial Council as Chairman. The fee increases that become effective June 1 1947 were recommended by this committee which also recommended elimination of the 5 per cent discount on medical bills. The committee is continuing its study and will make recommittee to continuing its study and will make recommittee.

mendations on the remainder of the schedule at an

carly date
"'I am happy to approve the medical fee increases
"Tam happy to approve the medical fee increases unanimously recommended to me by the committee of reference, representatives of all groups concerned in workmen's compensation, which has been studying this matter,' Miss Donlon said. 'The obligation of employers under the New York law to pay for medical care of industrially disabled workers imposes on the medical profession the duty of rendering the best possible care in workmen's compensation I hope this fair recognition of increased medical costs will encourage doctors throughout the State to give to disabled workers the professional

services they require, and for which industry pays'
"The new rules adopted by the Chairman of the
Workmen's Compensation Board and referred to

above, follow

# Medical Fee Schedule

"'By virtue of the authority vested in me by Sections 13(a) and 141 of the Workmen's Compensation Law, I, Mary Donlon, Chairman of the Workmen's Compensation Board, hereby promulgate the following rule establishing a revision in the schedule of fees for medical treatment and care under the Workmen's Compensation Law for the State of New Lory

"The medical fee schedule heretofore established by the Industrial Commissioner of the State of New York, as last amended by rule promulgated March 8, 1941, and adopted by the Chairman on April 2,

1945, is further amended by these rules
"1 Items. lines numbered 49 to 55. Items, lines numbered 49 to 55, inclusive, of the medical fee schedule are amended, effective as herein provided, as follows

ine No		r ee
49	First visit, home call, in-	
	cluding examination	\$5 00
50	First visit, office call, in-	
	cluding examination	3 50
51	Office call	2 50
52	Home call, other than	
	night emergency	4 00
53	Home call, night emerg-	
	ency (call received by	
	doctor between 10 00	
	PM and 7 OOAM)	6 00
54	Hospital call, other than	
	night emergency	2 50
55	Consultation of attend-	
	ing physician with spe-	
	cialist, attending physi-	
	cian's fee, same fce as	
	regular call or visit	

There is established the following new item.

line numbered 54(a) 51(a) Hospital call, night emer-

gency (call received by doc tor between 10 00 Pu and 7 00 AM)

" '3 Item line numbered 21, providing for a discount of 5 per cent on all medical bills in amounts of \$15 or more, if paid within 30 days, is hereby rescinded, effective as herein provided

Rules 1 and 2 above shall become effective June 1, 1947, and shall be applicable to medical care and treatment rendered under the Workmen's Compensation Law in new cases arising or old cases reopened on and after that date. With respect to medical care and treatment rendered on and after June 1, 1947, in pending cases that arose

prior to June 1, 1947, the provisions of the present fee schedule shall continue to be effective

Rule 3 above shall become effective June 1. 1947, with respect to all bills rendered on and after that date"

There are also attached a few orders of the Chair man, which will be given to the Reference Committee for study, and on which they will bring in their report for your approval (Applause)

The documents referred to by Dr Dattelbaum are

as follows

# Order of the Chairman

"Under and by virtue of the powers vested in me by law, I, Mary Donlon, Chairman of the Workmen's Compensation Board, hereby amend the Rules and Procedure under Sections 13 to 13-,, inclusive, of the Workmen's Compensation Law, as last promulgated on December 30, 1946, as herein provided, namely, "Rule 3 of the Rules and Procedure under Sections 12 to 12, transfer the cedure under Sections 13 to 13-1, inclusive, of the Workmen s Compensation Lan as last promulgated on December 30, 1946, is hereby repealed and new Rule 3 is hereby promulgated to read as follows

In order to expedite the processing of claims of disabled workers for workmen's compensation benefits and to avoid, as far as possible, appearance of physicians in con-tested bill proceedings, the rules with respect to filing of medical reports by attending All medical rephysician are here stated ports filed by attending physicians and specialists must contain the authorization cer-

tificate number and code letters

"Each physician shall file directly with the Chairman and also with the employer the follow-

ing report
"Within forty-eight hours following first treatment, a notice on form C-104, giving all infor-

mation required by such notice

"Within fifteen days after filing form C-104, and in no event later than seventeen days after first treatment, a complete report of injury and treatment on form C-4, giving all information required by such form

"During continuing treatment, a progress report or form C-14 at intervals of not less than

three weeks

"A final report on form C-14 immediately upon termination of treatment regardless of the last

Previous report C-14

'If the patient is discharged from treatment within forty-eight hours after first treatment, only the C-4 report shall be filed, and such C-4 report shall be marked 'Final'

"Additional or more frequent reports may be

required by the Chairman

"Whenever a report is filed with the Chairman by an attending physician after the time period for filing as provided herein and in Section 13-a (4) has clapsed, the physician shall attach thereto a signed and verified statement giving the true reason for which he requests excuse for late filing

'This rule shall become effective immediately on filing in the Office of the Department of State

SPEAKER ANDRESEN Thank you, Dr Datter-baum! The report will be referred to the Reference Committee on the Report of the Council, Part X, and you will hear about it tomorrow any other supplementary reports?

There was no response

SPEAKER INDRESEN If there are none we will continue with our other business

Section 19 (Sec 52)

#### Introduction of Representatives from Other State Societies

SPEAKER INDRESEN We have always enjoyed having with us delegates from our puis aboring state societies, and I now wish to call on any that may be here to come to the platform and give us a few

words if they will

From the State of Connecticut, Dr Joseph II
Howard, Past President I will ask Dr Kenney to escort him to the platform to say a few words

There was applause as Dr J Stanley Lennoy escorted Dr Joseph H Howard to the platform

DR. JOSEPH H HOWARD Mr Speaker Dr Buuer and Members of the House I am very happy to bring you greetings from the Connecticut State Medical Society Unfortunately frequently our meetings are held at the same time so we are not able to get over here

I was particularly anxious to come today because your delegate to our meeting last week after spend ing a morning seeing how our House functioned remarked that we were using some Tanumany technics in our meetings because they ran so smoothly assured me we would not see such a thing in New York State so I am anxious to see how you function in New York.

On behalf of my friends and colleagues in Con necticut I hope you have a very very successful

meeting. (Applause) SPEAKER ANDRESEN

From the State of New Jersey is Dr James F Nor ton Delegate here or Dr D Ward Scanlan Alter natel

There was applause as Dr D Ward Scanlan

Thank you Dr Howard!

SPEAKER ANDRESEN From the State of Penn sylvania, Dr Elmer Heas the President Elect is here and I will ask Dr Roy Henline to escort him to the platform

There was applause as Dr Roy B Henline excerted Dr Elmer Hess to the platform

DR. ELMER HESS Mr President, Mr Speaker, and may I say Fellow Members of the House of Delegates of the Medical Society of the State of New lork, it is a real pleasure for me to bring you greet

ings from my state society

I would like to get serious for just a moment if I might and say that you and I have no idea how close we came to losing the most precious thing in American life to us the private practice of medicine to the political efforts of the great mass of medical men over this country we were able to forestall this regimentation of our profession but do not think the battle is over In my opinion it has just begun and I believe that when they regiment us they de-

stroy the American way of life completely It is time for us to stand and be counted either are or we are not Americans The job of doing a good public relations treatment if you want to call it such is not propaganda from the state or county societies but it is the individual job that each one of you do in your offices and at the bedside with your sick patients. There is no more powerful political influence in this country than the influence that you have as an individual as you go about your daily work. Unfortunately the men who need that sort of advice seldom come to medical meetings and we are judged very often unfortunately by the actions of the few the public forgetting the great things done by the many

Thank you so much for the privilege of being here with you and greeting my old friend Dr Bauer as

your President (Applause)

SPEAKER ANDRESEN Is then a representative here from Vermont Dr D Dexter Davis? Dr Davis is a former New Yorker a former Brooklynite

There was no response SPEAKER ANDRESEY We are very much pleased to have there delegates from neighboring states here and we hope they will enjoy the sessions and will stay to see how we carry on our business here expect to have quite a lively session here tomorrow

#### Section 20 (See 31-44)

#### Announcements

SPEAKER ANDRESEN I wish to announce that there is going to be a banquet this evening for the members of the House of Delegates and that the tickets for it will be on sale in the hall Any body who wants to go tonight be sure and go there early to buy your ticket As I said before they will be on sale outside in the hall

# Section £1

#### Recognition of Dr Robert Brittain

We would now like to in SPEAKER ANDRESEN troduce our oldest member of the House Dr Robert Brittain of Delaware who has been a member for

over fifty years (Applause)

DR. ROBERT BRITTAIN Delaware Mr Speaker and Members of the House it gives me great pleasure to stand here before you as an old settler I feel that I am sort of blocking so many of the younger men and men who are perhaps so much further advanced in the medical science than I am by being here. I started in with horseshoes and horses and then I came along to the day where we have automobiles I don t know that I enjoy my practice any more with the car than I did with the good old horse One thing I could do with a horse that I cannot do with a car is I could sleep going

(Laughter) There are too many rocks and side hills with a car for me to enjoy doing that in one

It gives me great pleasure to have been introduced by your Speaker, and I hope that we will all be pleased with our meeting this year—I thank you for this opportunity to speak to you (Applause)

SPEAKER ANDRESEN—Thank you, Dr Brittain!

I hope that you will get another good speech ready for us for next year's session, when we will introduce

you agam

The floor is now open for the introduction of resolutions

Section 22 (See 114)

# Distribution of Medical Care

DR REGINALD A HIGGONS, Westchester Mr Speaker, I would like to offer a few words of explanation as to why Westchester puts this resolution in at this time Being a suburban county near a large urban center, we have a population of about 600,000, and we have 1,200 known physicians Of those 1,200, 200 have entered the county within the last eighteen months, and of those 200 we already have personal word that some are leaving due to their inability to make a living Our ratio of doctors to population is now about 1 to 500, and still they are being sent out to Westchester from the urban center on the advice of various people, therefore, we are putting in this resolution

"Whereas, the proper distribution of medical care is one of the major problems to be solved by present-day organized medicine if bureaucratic controls over medical practice are to be avoided,

"WHEREAS, since the war there appears to have been a trend towards even greater concentration of medical practitioners in the large urban and sub-

urban areas, now, therefore, be it "Resolved, that the Medical Society of the State of New York shall collect information from each County Society yearly and shall maintain an up-to-date registry which will enable prospective practitioners of medicine to determine with greater accuracy which communities in the State have need for their particular type of service and which communities already have adequate medical care. and be it further
"Resolved, that the existence of such a registry

shall be publicized through the State Journal of Medicine, the faculties of all grade A medical schools, and the chief of staff of each hospital approved for intern training in the State of New

York "

I would just like to say one more word in clarification Remember that the words "up-to-date registry" as used in the resolution do not apply to WORK that has already been done
SPEAKER ANDRESEN That will be referred to the

Reference Committee on New Business A, of which Dr Leo F Simpson is Chairman

Section 23 (See 129)

# Basic Science Law

DR CHARLES GULLO, Livingston This is introduced by the Livingston County Medical Society and concerns the Basic Science Law

"Whereas, the intent of the resolution of Dr George Cottis made before this House of Delegates in October, 1945, was that an abstract be printed of the essential points of the Basic Science Law, showing where it has worked and where it has not worked, why it has not worked, and whether the American Medical Association is wrong when it goes to the trouble of preparing a

model act for us to follow, and
"Where is, the Medical Practice Committee in its present report does not contain certain factual material necessary for its members to arrive at a proper decision as to the desirability for an ideal Basic Science Law for New York State as a safeguard to prevent the licensing of cults and at the same time to serve to implement the Medical Practice Act in order to prevent the circumvention of the Medical Practice Act, therefore, be it "Resolved, that there be a full discussion on the

floor in executive session with the House of Delegates serving as a committee of the whole, and that each County be given the opportunity to ex-

press some opinion upon this question

That resolution will be re-SPEAKER ANDRESEN ferred to the Reference Committee on Report of the Council, Part IX, on Medical Education

Section 24 (Sec 111)

# General Practitioner in the Practice of Medicine

Dr Benjamin M Bernstein, Kings resolution has for its purpose the restoration of the family doctor, which may prove to be the salvation of the practice of medicine. That is a large order, isn't it? It reads

"WHEREAS, the family doctor is the cornerstone in the practice of medicine, and

"WHEREAS, it is most urgent that the rightful place of the family doctor in the present and future

scheme of medical service be retained, and "Whereas, the development and growth of specialty boards are inimical to the best interests of the family doctor for whom no provision of certification or similar recognition is being made,

"WHEREAS, the acclaim given to the certified specialist in the hospital is rapidly tending to oust the family doctor from any position on a hospital

staff, and "Whereas, consideration being given to the establishment of group clinics likewise tends to the demoralization of the family doctor, and "Whereas, the incentive accorded the certified

specialists for intensive preparation for certifica tion and continued study is being neglected for the

family doctor, and
"Whereas, the declassification of the family
doctor in the estimation of the patient is to the detriment of the future of medical practice, and

"WHEREAS, it is to be noted that in this resolution the term used is family doctor rather than

general practitioner, be it
"Resolved, that a conference be called by the

House of Delegates of the American Medical Association consisting of representatives from the College of Surgeons, College of Physicians, the American Hospital Association, and the various specialty boards, in order to plan the future of the family doctor in future practice and in hospital organization

That resolution will be re-SPEAKER ANDRESEN ferred to the Reference Committee on Report of the Council, Part VI, of which Dr Edward P Flood is Chairman

Section 25 (Sec 77-115) Specialty Boards

DR FRANK LAGUTTUTA, Bronz Mr Speaker this resolution is presented by the Bronx County Medical Society through its delegates

"Whereas, affiliation of all physicians in the United States with some hospital as a means of professional improvement and mutual benefit has been the admitted aim of the American Medical Association and

Whereas many hospitals, the number in creasing constantly are taking measures which tend to restrict and limit such affiliations in order to satisfy requirements established by the numer

ous specialty boards, and

WHEREAS, these requirements of the numerous self-appointed and self-perpetuating specialty boards are arbitrary, discriminatory monopoli-tic, and often variable and contradictory and WHEREAS it has been accepted as a first prin

ciple in the administration of American Justice that a man be judged by a jury of his peers drawn

from his local community and

WHEREAS, educators concede that the determination of ability aptitude and training by a method that depends largely on an isolated ex amination presented under conditions of extreme pressure is unsatisfactory inefficient and unjust and

Wineress this entire problem presents a chal-lenge to Organized Medicine, to the ability of the American Medical Association to regulate itself with justice to all its members to the sincerity of Organized Medicine in its attempt to advance the Public Health and Welfare through the improve-ment of professional standards therefore, be it "Resolved, that the Bronx County Medical

Society through its Delegates request the Medical Society of the State of New York to take such measures to arrest and correct this iniquitous situation until such time as means may be found to place certification of specialists on a more reasonable democratic and local basis and be it further

Resolved that failing to obtain cooperation from the various specialty boards within a reason able period of time the American Medical Association be requested to withhold recognition from hospitals which make certification by a specialty board a necessary qualification for appointment or promotion on a hospital staff

SPEAKER ANDRESEN Referred to the Reference Committee on New Business A of which Dr Leo F Simpson is the Chairman

#### Section 20 (See 113) Group Practice

Dr. Scott Lond Smith (District Delegate) resolution is designed to clarify the conditions under which doctors may work in group practice and employment by health associations, which recent legislation in the State of New York makes legal

"WHEREAS the complexity of medical knowledge makes necessary close cooperation of practicing physicians and pooling of their various

skills, and
Whereas, recent enactment of laws in this state makes legal provision for such combinations and associations in the practice of modicine in the several specialties and

"I HEREAR possibilities of othical abuse under such legal permission are not inconsiderable and

"Wheneas, further enactment of law broadens the conditions under which corporations and associations of laymen may employ physicians in furnishing medical care for their subscribing mem bers, therefore be it

'Resolved that the Council of the New York State Modical Society be requested to furnish in as much detail as possible the partnership and group practice regulations financial agreements and possible participation with laymen under which the members of Organized Medicine may practice their profession

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council Part VI of which Dr Edward P Flood is Chairman

Section 27 (See 112) Group Practice

DR. ALFRED M. HELLMAN New York resolution on Group Practice presented at the request of the Medical Society of the County of New

"Witereas group practice is of increasing in terest in the profession because of various prepay ment plans which seek to encourage the practice of medicine in groups and

Where As, there are no largely accepted prin ciples or rules governing the practice of medicine

in groups and Wheneas it is desirable that the American Medical Association supervise this development rather than forfeiting it to organizations not affiliated with Organized Medicine therefore be

'Resolved that the delegates of the Medical Society of the State of New York instruct its delegates to the American Medical Association to propose a resolution to that body that will bring about the provision by the American Medical Association for the establishment of a bureau or council on group practice the functions of such bureau will be (a) To serve as a clearing house of information

on group practice throughout the United

States

To formulate professional ethical and other principles governing the develop-

ment of such group practice
And ultimately at its discretion to provide for qualifications and recognition of groups engaged in group practice in the various parts of this country

That will be referred also SPEAKER ANDRESEN to the Reference Committee on Report of the Council Part VI of which Dr Edward P Flood is Chair

Section 38 (See 95-150)

Establishment of Organization Section in the New York State Journal of Medicine

DE. FRIDERICK W WILLIAMS, Bronz This resolution is also presented on behalf of the Bronz County Medical Society

WREREAS, sound functioning of a democratic organization is dependent upon an informed alec-

Totate and WHEREAS our New York State Medical Sool ety especially the House of Delegates is such a democratic organization, and
Whereas the Council acts for the State Soci

ety between ressions of the House of Delegates and

"Whereas, it is the custom to publish the reports of the Officers, Council, and Standing Committees in the April 1 and April 15 editions of the New York State Journal of Medicine just preceding the annual meeting of the House of Delegates, and

"Whereas, this custom allows insufficient time for study and deliberation by the representative county societies to enable them to instruct their

delegates, therefore, be it "Resolved, that the House of Delegates of the Medical Society of the State of New York direct the Publications Committee to establish an Organization Section in the New York State Journal of Medicine similar to that of the Journal of The American Medical Association, and be it further

"Resolved, that there shall be published in this section all minutes of Council meetings, progress reports of all standing and special committees, and any additional information which the Council

may direct, and be it further "Resolved, that the annual reports be published in the March 15 and April 1 issues of the New York State Journal of Medicine"

SPEAKER ANDRESEN Referred to Reference Committee on Report of the Council, Part XI, Publication, of which Dr Eugene H Coon, of Nassau, is Chairman

Section 29 (See 60)

# Equal Privileges for Returning Veterans (Treatment of Veterans)

Dr. WILLIAM OSTROW, Kings This resolution is from the Medical Society of the County of Kings

"Whereas, a number of physicians, citizens of the United States, graduates from foreign medical schools, the majority of whom are members of the Medical Society of the State of New York, honorably served as commissioned officers in the armed

forces, and "Whereas, these veterans were licensed to

practice medicine in the State of New York, and "Whereas, these veterans now find that the Veterans Administration of the United States is not according them the same privileges to treat veterans as are accorded to the graduates of American schools, be it

"Resolved, that the House of Delegates go on record as favoring and urging the Veterans Administration to give these medical veterans the same status as is given to the veterans who graduated from American schools, and be it further

"Resolved, that a copy of this resolution be printed in the State Medical Journal and copies of this resolution be forwarded to the Veterans Administration of the United States and to the coordinator of the Veterans Bureau in New York"

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council, Part VIII. Veterans' Affairs

Section 30 (See 62)

# Equal Privileges for Returning Veterans (Postgraduate Training)

DR WILLIAM OSTROW, Kings This is another one pertaining to the same subject, equal privileges for returning veterans

"Whereas, a number of physicians, citizens of the United States, graduates from foreign medical schools, the majority of whom are members of the Medical Society of the State of New York, honorably served as commissioned officers in the armed forces, and

"Whereas, these veterans were licensed to practice medicine in the State of New York, and "WHEREAS, these veterans now find that they

are denied the same opportunities for postgraduate study and training in accredited medical colleges and hospitals as the graduates of American col-

leges, be it
"Resolved, that the House of Delegates go on record as favoring that these veterans be accorded the same privileges to obtain postgraduate training as the graduates of American schools, and be

it further

"Resolved, that a copy of this resolution be printed in the State Medical Journal and copies of this resolution be forwarded to the colleges and hospitals giving postgraduate instruction in the State of New York"

That will also be referred Speaker Andresen to the same committee, the Reference Committee on Report of the Council, Part VIII, Veterans' Affairs

Section 31 (See 20-44)

Announcement

I would like to make an SPEAKER ANDRESEN announcement to the effect that the Board of Trustees will have a meeting immediately upon adjournment of this session across the hall

Section 32 (See 96)

# News Releases of American Medical Association

DR SAMUEL GITLOW, Bronx This is introduced on behalf of the Bronx County Medical Society

"Whereas, the American Medical Association issues a news release each Friday on the content of articles appearing in the forthcoming Journal of the American Medical Association, and "Whereas, these releases reach the public

through the newspapers before the physicians have received their Journals containing the complete

articles, and

"WHEREAS, patients partially informed through these releases frequently ask their physicians

about such items, and

"Whereas, these questions have been a source of embarrassment to the medical profession and have tended to affect adversely the confidence placed by the patient in the doctor's knowledge of current scientific advances, therefore be it

"Resolved, that such advance press items either be discontinued altogether or be released after the actual receipt by the medical profession of the

American Association Journal, and be it further "Resolved, that the delegates to the convention of the American Medical Association from the Medical Society of the State of New York be instructed to seek the passage of a similar resolu-

Speaker Andresen Referred to the Reference Committee on Report of the Council, Part XI, of which Dr Eugene H Coon is Chairman

Section 33 (See 98)

# Licensing of X-Ray Departments as Laboratories by Hospitals

DR NELSON W STROHM, Erre This resolution concerns the licensing of x-ray departments as laboratories by hospitals

"WHEREAS there has been enacted a law which permits hospitals to license x-ray departments as

laboratories and

"WHEREAS this law is in conflict with and cir cumvents Chapter 466 of the Education Law of 1914 and Chapter 450 of the Workmen & Compen sation Law of 1944 relative to the division of fees

"WHEREAS this permissive law does not serve the best interests of the citizens of the state especially the ill be it

'Resolved, that the counsel of the Medical Society of the State of New York proceed legally to test the validity of this act or law

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council Part IN Legislation.

# Section 34 (See 61)

Veterans' Dues

DR. Ezra A. Wolff Queens This resolution is introduced at the instruction of the Medical Society of the County of Queens

"WHEREAS the House of Delegates has adopted the principle of modifying payment of dues by members of the Medical Society of the State of New York in active military service for the dura tion of such service and

'Whereas so-called 'terminal leave is included in the term of active service therefore, be

' Resolved that the period of modified dues pay ment be calculated from the end, not the begin ning, of the terminal leave

SPEAKER ANDRESEN Referred to Reference Committee on Report of the Council Part VIII Veterans' Affairs

#### Section 85 (See 116) Podlatry

Dr. Renato J Azzari, Bronz. This is a resolu tion that has to do with podiatry

"Wireness podiatry is a technical minor ad

junct of orthopedics, and

"WHEREAS, many major systemic diseases have manifestations in lesions of the lower extremity and

WHIREAS The Institute of Podiatry is not a

medical school and

Wheneas, the licensed podiatrists have been active in attempting to pass legislation in this State to extend the limitations of their licensure to include the treatment of systemic disease, and

WHEREAS the treatment of disease constitutes the practice of medicine under the laws of this

State, and
WHERDAS the passage of such legislation
would be detrimental and hazardons to the public health and welfare, therefore be it 'Resolved that the Medical Society of the State

of New York put itself on record as being opposed to such legislation and be it further Resolved that the Governor and members of

both Senate and Assembly be sent copies of this resolution and be it further Resolved that the Legislative Committee and

our Albany representative be instructed to govern themselves accordingly and be it further

Resolved that the content of these resolutions be made known to the Board of Regents of the State of New York.

SPEAKER ANDRESEN Referred to the Reference Committee on New Business C of which Dr Theodore J Curphey is Chairman

Section 36 (See 109)

Furnishing of Medical Service with Hospitalization Insurance

Dr. Sol Axelhad Queens This is a resolution that is brought in on instructions of the County of Queens

"Whereas the services of the pathologist roentgenologist anaesthesiologist and physical therapist are medical services and

"WHEREAS Blue Cross Plans wrongfully offer these services to the public as benefits under hospitalization insurance policies and

WHERDAS, Associated Hospital Service the Blue Cross Plan covering seventeen lower New York State counties has refused to agree to dis-

continue this practice, therefore be it

"Resolved, that the Medical Society of the State
of New York through its House of Delegates expresses its disapproval of such practice and be it

lurtber

Resolved, that the Society shall withdraw its endersement of Associated Hospital Service or other Blue Cross Plan operating in New York State unless the practice of supplying medical service under hospitalization policies is discon tinucd.

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council, Part VI on Modical Care

Section 37 (Sec 63)

Medical Consultants in the Veterans Administration

DR BENJAMIN M BERNSTEIN Kings This resolution is introduced on instructions from the Medical Society of the County of Kings

WHEREAS, the Veterans Administration has initiated a policy of appointing part-time medical consultants to supplement their own staff and

WHEREAS, these consultants are selected by committees of deans from medical schools, and WHEREAS it is the policy of these deans to select no consultants except those who are on the

teaching staffs of medical schools, and "Whereas, this policy discriminates against other qualified and competent specialists outside of medical schools and establishes an exclusive monopoly of veteran consultant care and

WHEREAS, this discriminatory practice of con-sultant selection deprives the veteran of some of the best medical skills particularly by veteran physicians who held responsible positions during the war and best understand the problems of the

veteran therefore, be it

Resolved that the Medical Society of the State of New York go on record as being opposed to the present process of selection for consultant Veter ans Administration medical specialists, and that the responsibility for consultant selection bo placed in the hands of an impartial board consist

ing of members of Organized Medicine and the present deans committees Referred to the Reference SPEAKER ANDRESEN Committee on Report of the Council Part VIII

Veterans Affairs

(Sec 8, 47, 102, 104) Section 38 Report of Malpractice Insurance and Defense Board

DR I STANLEY MENNEY Mr Speaker and Members of the House, the Malpractice Insurance and Defense Board felt that they had a message for the House of Delegates of such importance for their guidance in considering the report when it is brought before the House by the Reference Committee tomorrow, and the nature of the information is such that they have requested permission to have an evecutive session in which to impart this information We have no objection to any of the lay secretaries or other responsible associates of the component societies remaining

I, therefore, make a motion, requesting that this House go into executive session for the consideration

of this report
DR. THOMAS J D'ANGELO, Queens I second the

motion

SPEAKER ANDRESEN If Dr Kenney and the House have no objection, we will put off the executive session until the end of the meeting today when all of the resolutions have been presented and can thus be considered by the appropriate reference committees, after which we can have the executive session and then adjourn until tomorrow no objection, we will order that Hearing none, that will be the procedure that we will follow

Section 39 (Sec 70) Activities of the Medical Practice Committee

DR. J. F. PAINTON, Erre Mr. Speaker and Members of the House, this resolution is offered on instructions of the Medical Society of the County of Ene

"Whereas, the Medical Practice Committee of Greater New York, functioning as a state-wide agency of Workmen's Compensation Law, receives application for, and recommends rating and rerating of physicians outside Greater New York,

and
"Whereas, the Medical Practice Committee of
Greater New York has established standards for qualifying physicians throughout the State, and

"WHEREAS, the Medical Practice Committee of Greater New York receives applications for and recommends the licensing of Workmen's Compensation Medical Bureaus outside Greater New

York, and
"Whereas, these acts of the Medical Practice
Committee of Greater New York are an illegal
usurpation of the rights of County Medical Societies outside of Greater New York therefore be it

"Resolved, that the counsel of the Medical Society of the State of New York proceed legally to restrain the Medical Practice Committee's activities as a state-wide agency of Workmen's Compensation Law

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council, Part X. Workmen's Compensation

Section 40 (Sec 64)

Medical Indemnity Plan-North Eastern New York Medical Service, Inc.

DR RAYMOND F KIRCHER, Albany This is on the subject of a medical indemnity plan

"The Medical Society of the County of Albany requests the House of Delegates to endorse the North Eastern New York Medical Service, Inc.

Referred to the Reference SPEAKIR ANDRESEN Committee on Report of the Council, Part VII. Medical Care Insurance

Section 41 (See 76)

Amendment to Constitution

DR HOMER J KNICKERBOCKER, Ontario resolution is introduced at the request of the Ontario County Medical Society, in whose area the conditions with which it deals are prevalent and are presumably similar to those which pertain in other areas

'Whereas, certain county medical societies have been privileged to elect Associate Members whose elections have been accomplished by following the same routine applicable to Active Members, and

"Whereas, these Associate Members have been exempt from payment of assessments levied by the

State Society, and 'Whereas, these Associate Members have been granted all the privileges of Active Members ev-

cept that they may not hold elective office, and "WHEREAS, no provision is made in the constitution of the Medical Society of the State of New

York for such membership therefore be it "Resolved, that Article II of said Constitution be amended by the deletion of the word 'three' and the substitution of the word 'four' and the addition of the word 'Associate' under the caption of 'D' thus making the article read, viz

"The membership in this Society shall be divided into four classes (a) Active, (b) Retired, (c) Honorary, (d) Associate

SPEAKER ANDRESEN That will be published before the next meeting of the House, and will be held over until next year and acted upon at that time It being an amendment to the constitution, we cannot take any action on it at this time

DR KNICKERBOCKER It may come up as a substitute for one that has already been published, and

which is along similar lines

SPEAKER ANDRESEN That we were to act on now, at this year's meeting of the House?

DR. KNICKERBOCKER Yes There has been one published that covers the same grounds as this SPEAKER ANDRESEN

That being the case, we will refer it to the Reference Committee on Amendments to the Constitution and Bylaws

Section 42 (See 75) Amendment to Bylaws

of the House

DR HOMER J KNICKERBOCKER, Ontario same ruling would apply to this, which is offered as a substitute for an amendment to the Bylaws already published, and that will be acted on at this meeting

"Whereas, the present Bylaws of the Medical Society of the State of New York make no mention of Associate Membership, therefore be it

"Resolved, that Chapter 1 of the Bylaws entitled 'Membership' shall have added thereto a new section to be known as Section 8 to read as follows

"Section 8 Constituent County Medical Societies may elect Associate Members from among the personnel of US Government facilities located within their jurisdiction by following the same routine as prescribed for the election to Active Membership, except that New York State Registration may not be deemed essential. Associate Members shall be exempt from pay ment of State Medical Society assessments. They shall be accorded all the privileges of Active Membership except voting holding elec-tive office, or being eligible to malpractice de-fense by counsel of the Medical Society of the State of New York.

That will also be referred SPEAKER ANDRESEN to the Reference Committee on Amendments to the Constitution and Bylaws of which Dr Peter J DiNatale is Chairman. As I understand it, both of these are substitutes for amendments already published and that are to be acted upon this year

DR. KNICKERBOCKER Right

Section 43 (See 68) Workmen's Compensation—Upward Revision in Fee Schedule

Dr. George A Burgin Herkimer I have been asked to present this resolution, which may not be as applicable as it was before the Supplementary Report of the Workmen's Compensation Committee was given today but because of lack of full informa tion on that I will present it anyway The follow ing resolution was presented to the Herkimer County Medical Society at its last meeting on April 8 1947 and adopted

"WHEREAS, the Medical Society of the County of Herkimer and numerous other county medical societies of the State of New York have repeatedly, and without success, sought an increase in the Workmen's Compensation fee schedule of the State of New York to bring it more in harmony with the rise in costs of the practice of medicine, therefore be it

"Resolved, that the members of the Medical Society of the County of Herkimer do hereby agree that on and after May 15, 1947, they will consider the existing fee schedule as a minimum schedule only, and that on and after May 15 1947 they will make charges in all new compensation cases coming under their care after that date based upon the present-day standards of medical costs. They further agree to submit to arbitration all such bills as are disputed by the carriers, and be it

Resolved that a copy of this resolution be for warded to the Secretary of the Medical Society of the State of New York and to the Chairman of the Workmen's Compensation Board and be it fur ther

'Resolved that the delegate from this county to the annual meeting of the House of Delegates of the Medical Society of the State of New York, to be held in May 1947 be instructed to present this resolution and aid in every way the State Compensation Bureau in its efforts to secure the proposed changes in the fee schedule

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council Part A, Workmen s Compensation.

# Section 44 (See 20 31)

#### Announcement

SPEAKER ANDRESEN I want to make an announcement. Due to a misunderstanding I made a terrible mistake when I told you there were tickets on sale for this ovening. The tickets are for the banquet on Wednesday night. There is no banquet scheduled for tonight.

I would like again to request the Chairmen of the Reference Committees to let Miss Dougherty know when they are going to meet. Are there any further resolutions?

Section 45 (See 69)

Qualifying and Rating of Physicians Under the Workmen's Compensation Law

DR. WILLIAM J ORR (District Delegate) This resolution has to do with the qualifying and grading and rating of physicians under the Workmen's Compensation Law

"Whereas the proper rating and authorization of physicians is vitally essential to the effective accomplishment of the purposes of the Work men s Compensation Law particularly the provi-sion of the highest quality care for injured work

ers, and Whereas, the County Medical Societies of this State have performed a notable job in assisting the Chairman of the Workmen's Compensa tion Board to properly rate and authorize physicions to render medical care to persons entitled to the benefits of the Workmen s Compensation Law and

WHEREAS, the 1947 State Legislature enacted the Condon Bill which empowers the Chairman of the Workmen's Compensation Board to review

and revise physicians compensation ratings and "Wheneas, the Medical Society of the State of New York believes that the County Medical Societies, because of their specialized knowledge familiarity with local conditions, and with the status of the status of the specialized knowledge familiarity with local conditions, and with the actual qualifications of physicians are best equipped to determine the character of medical care physicians are qualified to render therefore

be it "Resolved, that the Medical Society of the State House of Delegates, recommend to the Chairman of the Workmen's Compensation Board that revi sions of ratings be made by the County Medical Societies and the Chairman of the Workmens Compensation Board in accordance with the qualifying standards heretofore formulated by the County Medical Societies—and be it further

'Resolved that a copy of this resolution be transmitted by the Secretary of the Medical Society of the State of New York to the Chairman of the Workmen s Compensation Board

Speaker Andresen Referred to the Reference Committee on Report of the Council Part A. Work men a Compensation

#### Section 46 (8ee 67)Nursing

ASSISTANT SECRETARY FREY This resolution is introduced by the Council Committee on Nursing at the request of the Coordinating Council on Nursing Problems which has representatives from the State Medical Society the State Hospital Administrators Association, the State Nurses Association and the Practical Nurses

"WHEREAS, there is an over all shortage of nurses both registered professional and practical,

in New York State, and 'Wheneas, nursing is a noble and an attractive profession and

WHEREAS physicians have a special opportunity to present the advantages of a nursing career to the daughters and sons of their patients therefore be it

"Resolved, that this House of Delegates recommend that the Members of the Medical Society of the State of New York use their influence individually and personally to further the recruitment of candidates for nurses' training schools, both registered professional and practical, throughout the state"

That will be referred to the SPEAKER ANDRESEN Reference Committee on Report of the Council, Part XII, of which Dr Joseph Geis is Chairman

Are there any further resolutions?

There was no response

In that case we will con-SPEAKER ANDRESEN

sider going into executive session

The motion was put to a vote, to go into executive session to hear the report of the Malpractice Insurance and Defense Board

(See 8, 38, 102, 104)

Report of Malpractice Insurance and Defense Board

SPEAKER ANDRESEN We will appoint as Sergeant-at-Arms, Dr Charles F McCarty, of Kings, and as his assistants Dr Ezra A Wolff, of Queens, Dr Frank LaGattuta, of Bronx, Dr David Corcoran, of Suffolk, and Dr Elton R Dickson, of Broome

The Sergeant-at-Arms and his assistants will clear the House of all except delegates In the past it has been customary to allow to remain also—and we will continue that practice unless there is objection—the Executive Secretaries of the county societies, the Executive Officer of the State Society, Mr Wanvig, our insurance adviser, our counsels, Mr Martin and Mr Clearwater, and the Executive Secretary of the State Board of Medical Examiners, Dr Lochner

Dr George W Kosmak May I ask that there be included in that the Editorial Board of the

JOURNAL.

SPEAKER ANDRESEN Also the Editorial Board

of the JOURNAL.

DR EDWARD R CUNNIFFE What about the delegates who are visiting us from other state societies?

SPEAKER ANDRESEN They are also entitled to stay, having been delegated to come here from other state medical societies

Dr Benjamin M Bernstein, Kings

about alternates?

SPEAKER ANDRESEN A suggestion has been made that any alternates who are here may also be Is there any objection to that? allowed to stay

Hearing none, it is so ordered

The president of one of our county societies is He is not a delegate, and he wants to get the consensus of opinion of the House as to whether the presidents of the county societies who are here and who are not members of the House should be allowed It has not been customary to allow to remain them to do so in the past

DR CHARLES GORDON HEYD (Past-President)

so move

The motion was seconded by several, and as there was no discussion, it was put to a vote and was unanimously carried

DR McCarty I wish to report that the House has been cleared of all those who were not entitled to remain to the Evecutive Session

I declare the House of SPEAKER ANDRESEN

Delegates now to be in executive session

At this point the House went into executive session, at the conclusion of which a resolution was presented by President Bauer, and was referred by the Speaker to the Reference Committee on Report of the Malpractice Insurance and Defense Board

The action on this resolution appears under Section 104

Section 48 (See 71)

Workmen's Compensation—Fee Schedule

DR A F GAFFNEY, Oneida This resolution has been handled already by the announcement made this morning, but since we were asked to present it on behalf of the Medical Society of the County of Oneida, we will do so

"WHEREAS, the cost of medical practice has markedly increased since the present fee schedule of the Workmen's Compensation Department was revised, and

"Whereas, the fees of private practice in the County of Oneida have increased due to the rise of

the cost of medical practice, be it

"Resolved, that the delegates to the State Convention from Oneida County be instructed to present to the House of Delegates of the State Society a resolution asking for an increase in the workmen's compensation fee schedule '

Referred to the Reference Speaker Andresen Committee on Report of the Council, Part X, Workmen's Compensation

Section 49 (See 127)

Conditions Governing the Relationships Between the Hospitals and the Specialists of Laboratory Medicine in the State

DR STEPHEN H CURTIS (Section Delegate) resolution is introduced at the request of the New York State Society of Pathologists and the Section on Pathology, and it concerns conditions governing the relationships between the hospitals and the specialists of laboratory medicine in the State

"Whereas, it has been established by the American Medical Association that the practice of Pathology is the practice of Medicine, and

"WHEREAS, many of the recent advances in the field of medicine are districtly attributable to the contribution of the workers in the field of laboratory research and the practical application thereof

in the field of clinical medicine, and
"Whereas, the practitioner of medicine wel
comes and utilizes fully the scientific help supplied by these practitioners of laboratory medi

"WHEREAS, in the hospitals of this country there now exists an intolerable situation by which the natural expansion of Laboratory Medicine is

being retarded

Through the improper and arbitrary con-(a) trol of the scientific and administrative efforts of this group of medical practitioners, and

By the extensive economic exploitation by the institutions of the scientific efforts of

this group, and

"WHEREAS, it is the feeling that the present ex-isting situation will diminish the number of younger men entering the ranks of this specialty. thus seriously depleting a growing and increasingly useful branch of medical practice, now be it "Resolved, that the House of Delegates of the

Medical Society of the State of New York give cognizance to the existing situation, and be it

further

"Resolved, that the situation be carefully studied by the Society with the avowed purpose of developing a new pattern of practice of the specialty

[Continued on page 1920]

#### ABSTRACT OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

THE Council held its organization meeting on Wednesday May 7 1917 at the Memorial Audi torium Buffalo New York In addition to minor routine matters the Council took action on the following

Secretary & Report

Remission of State Assessments -The remission of State assessments was voted on account of service with the armed forces for 59 members for 1947 and 52 for 1946 also on account of illness for Drs. Joseph W Goldsmith, Max Lederer Eugene W Martz, Joseph F Morris Philip Oginz, Herbert 8 Pierson Lorne McD Ryan Isalah R. Shapiro S Aleville Skinner, Alexander A Stone Fred Washnitzer and Edwin B Wilson

At its meeting on June 19 1917 the Council considered various matters taking final action or direct ing further study and reports as indicated under the following headings.

### Secretary's Report

Remission of State Assessments.—The remission of State assessments was voted on account of service with the armed forces for 445 members for 1947 47 for 1946 8 each for 1945 1944 1943 and 1942 and 2 for 1941, also on account of illness for Drs Julius B Boehm, Alex M. Gluckstein, Sidney H Saffer Herman W Taylor, and Irving Traun. Meetings Attended.—After returning from Buf

falo on May 10 your Secretary visited Philadelphla on May 22 to attend the Middle Atlantic States Regional Conference on Medical Service of the American Medical Association. The Society also was represented by Drs Aranow Kenney, and Red way and Mr Farrell Dr Thomas A. McGoldrick was also present as vice-chairman of the Conference. The subjects on the program were

Present status of United Mine Workers

Medical Health Program

2. Organized Medicine s Relationship to the various cancer drives

The present Taft-Smith Donnell Bill

The Hill Burton Bill

Changes in the Medical Policy of the U.S Veterans Administration

There was considerable discussion of each topic, particularly the last.

Also during lunch Mr J William Holloway Jr of the Legal Department of the American Medical Association discussed the present legislative situation in Washington.

House of Delegates Matters Taken Care of -The directives of the House of Delegates have been fulfilled by your Secretary in such matters as notify ing all constituent county socretaries and treasurers regarding the 1948 State assessment and the inter pretation that the severance date when members eave the armed forces is to be considered the end of terminal leave.

A copy of the resolution which decries the existing method of appointing consultants to the Veterans Administration facilities was sent to each of the New York State modical college deans.

Your Secretary has contacted Dr Robert R. Hannon, Executive Officer and is in the process of asking the Chairman of Scientific Sections to appoint legislative advisory committees as approved by the

House of Delegates

In accordance with the House of Delegates direc tive Mr William F Martin Counsel has been asked for an opinion regarding review and revision of ratings of physicians under an amendment of the Workmen's Compensation law Copies of the House of Delegates resolution re-

garding medical services for veterans have been for warded to Honorable Harry S. Truman, President of the United States of America, and General Omar

N Bradley, U.S Veterans Administration. Copies of a resolution passed by the House of Del egates regarding equal privileges for returning vet-erans in postgraduate study and training in medical colleges and hospitals for graduates of domestic and foreign medical schools, have been sent to the deans of medical colleges in New York State and will be disputched to hospitals as soon as a proper list is compiled

In preparation for the meeting of the American Medical Association House of Delegates each of our delegates was sent a copy of each of the six resolu-tions passed by our own House of Delegates which require presentation at Atlantic City and arrangements were made for a caucus the evening preceding the American Medical Association House of Delegates To this we invited ex Presidents Van Etten and Hoyd, and the two New York State members who were listed as delegates from A.M A. Sections as well as Dr. Hannon and Mr. Anderson.

#### House of Delegates Matters Referred to Council for Action

Partnership and Group Practice Legislation

Your Reference Committee endorses the rec ommendation of the Planning Committee that this House of Dukgates authorize the Council to have drafted suitable legislation to cover the matter of partnerships and group practice within the principles already approved by the State Society and that in the drafting of this proposed legislation, other interested agencies be consulted and their aid and cooperation solicited

After discussion

It was voted to refer this matter to the Legisla tive Committee.

Contract with Kings County Medical Society

"We have read the supplementary report of the Council Committee on Contract with Kings County Medical Society

'We agree that the Editor of the JOURNAL should be privileged to state to whom books should be sent for review that the books remain in the hands of the reviewer and furthermore that the Editor of the Journal should have ready for reference all

journals received for a definite period

"These requests necessitate a modification of the contract. In order to accomplish this, your Reference Committee recommends that this matter be referred to the Council in conjunction with the Comitia Minora of the Kings County Society for their determination and such reference as may be needed in relation to the continuance or the termination of such a contract.

After discussion,

It was roted that the matter be referred to the legal counsel of the two societies for preliminary report

and then have it taken up by a Joint Committee of the Council and of the Comitia Minora of the Kings County Society

Licensing of X-Ray Departments as Laboratories

"WHEREAS, there has been enacted a law which permits hospitals to license x-ray departments as laboratories, and

"WHEREAS, this law is in conflict and circumvents Chapter 466 of the Education Law of 1944 and Chapter 459 of the Workmen's Compensation Law of 1944 relative to the division of fees, and

"Whereas, this permissive law does not serve the best interests of the citizens of the State, es-

pecially the ill, be it

"Resolved, that the Counsel of the Medical Society of the State of New York proceed legally to test the validity of this Act or Law"

"Your Reference Committee agrees in principle with the resolution However, because of the many factors involved in preparing a legal testing of the validity of the law, which requires further study. your Reference Committee therefore recommends that this resolution be referred to the Council.

"One of the things that it entails is the expenditure of moneys I don't think we are qualified to give you a definite opinion on that"

Employment of Radiologists by Hospitals, on Salary

"Whereas, the 1947 State Legislature enacted an amendment to Section 13-c(2) of the Workmen's Compensation Law which permits hospitals to employ radiologists on a salary basis, and

"WHEREAS, this new law is inconsistent and is in conflict with Section 1261-4 of the Education Law and Section 13-d(2g) of the Workmen's Compensation Law, which prevent hospitals from employing radiologists on a salary basis, and "Whereas, these statutes will result in a great

deal of confusion in the minds of radiologists as to

whother they may accept a salary, therefore, be it "Resolved, that the Counsel of the Medical Society of the State of New York take legal steps to secure an interpretation of the statutes relating to the permissible financial relationship between hos-

pitals and radiologists
"Whereas, this resolution and the previous one are closely related, your Reference Committee recommends the same action as upon the previous one, namely, that it be referred to the Council of the Med-

ical Society of the State of New York.'

After discussion.

It was voted to refer the above resolutions to the Legislative Committee and the Legal Counsel for study and report at the next meeting of the Councıl

# X-Ray Diagnosis

"Whereas, a bill to amend Section 1250 of the Education Law of the State of New York in relation to practice of x-ray diagnosis and treatment, and treatment by radium was introduced in the 1947 legislature, which bill was not passed, there-

fore, be it "Resolved, that the Medical Society of the State

the New York State Legislature in 1948 as follows "X-ray diagnosis means that method of medical practice in which demonstration and examination of the normal and abnormal structures, parts or function of the human body are made by use of x-rays, and any person who holds himself out to diagnose or able to make or makes any interpretation or explanation by word of mouth writing, or otherwise, by the meaning of a fluoroscopic or registered shadow or shadows of any part of the human body made by the use of xrays, and also the use of x-rays or radium for the treatment of any human ailment, shall be deemed to be engaged in the practice of medi eine within the meaning of this article, and Section 1262, as follows The provision of this article shall be deemed to prohibit the practice of x-ray diagnosis, x-ray therapy, or radium therapy, as defined in subdivision 7-A of Section 1250 of this Chapter by any person other than a person licensed as a physician, a dentist, an osteopath, or a podiatrist "Be it further

"Resolved, that the Medical Society of the State of New York actively work for the passage of such a bill in the Legislature during the year of 1948" This resolution was approved in principle and referred to Council for proper wording

After discussion.

It was voted to refer the above resolution to the Legislative Committee for necessary action

Group Practice

"Resolved, that the Council of the Medical Society of the State of New York be requested to furnish in as much detail as possible the partnership and group practice regulations, financial agreements, and permissible participation with laymen, under which the members of Organized Medicine may practice their profession" After discussion.

It was voted that the above resolution be referred to the Planning Committee in consultation with the Committee on Ethics, and such other groups as the Committee deems advisable

# Distribution of Medical Care

"Resolved, that the Medical Society of the State of New York shall collect information from each County Society yearly, and shall maintain an up-to-date registry which will enable prospec-tive practitioners of medicine to determine with greater accuracy which communities in the State have need for their particular type of service and which communities already have adequate medical care, and be it further

"Resolved, that the existence of such a registry shall be publicized through the NEW YORK STATE JOURNAL OF MEDICINE, the faculties of all Grade A medical schools, and the chief of staff of each hospital approved for intern training in the State

of New York."

"Your Reference Committee believes that the purpose of this resolution will be adequately served by the issuance of the new medical directory of the State of New York within a few months, and that the establishment of such a registry would be an unnecessary expense to the Society

"We believe also that this type of information is rarely sought for by prospective practitioners, and that the stimulus for them to do so should originate

in the medical schools and hospitals

Your Committee suggests that the Medical Society of the State of New York, through its publications and by any other available means, solicit the cooperation of the medical schools and hospitals in this matter

"Your Committee recommends that this resolution be referred to the Council for consideration and

action '

It was roted to refer this to the Publication Committee for study and report.

Podiatry

"Whereas podiatry is a technical minor ad junct of orthopedies and

"Whereas many major systemic diseases have manifestations in lesions of the lower extremity.

"WHEREAS, the Institute of Podairty is not a

medical school, and 'Wheneas the licensed podiatrists have been active in attempting to pass legislation in this State to extend the limitations of their licensure to include the treatment of systemic disease and

"Whereas the treatment of disease constitutes the practice of medicine under the laws of this

State, and
"Whereas, the passage of such legislation
would be detrimental and hazardous to the public

health and welfare therefore, be it Resolved, that the Medical Society of the State

of New York put itself on record as being opposed to such legislation, and be it further
Resolved that the Governor and members

of both Senate and Assembly be sent copies of this

resolution and be it further

"Resolved that the Legislative Committee and our Albany representative be instructed to govern themselves accordingly and be it further

Resolved that the content of these resolutions be made known to the Board of Regents of the

State of New York.'

Referred to the Council Committee on Legislation in order that more vigorous opposition to any proposed legislation in this connection shall be fortered directly by the New York State Society After discussion,

It was roted that a Subcommittee be appointed to assist and report to the Legislative Committee, this Subcommittee to consist of Dr Dattelbaum chairman, Dr Mott of the Legislative Committee, and the chairman of the Section on Orthopedics and that they call in representatives of medical education to get their ideas

#### Training of Medical Technicians

Resolved, that the Medical Society of the State of New York memorialize the colleges and universities of the State, urging them to establish a fouryear curriculum for the training of medical technologists including a minimum of one year of su pervised practical experience in an approved hospital and which will lead to a degree in Medical Technology and be it further

Resolved that consideration be given to a limited program consisting of one year in basic courses and one year of practical hospital training in which certification may be granted as a junior grade

medical technologist

Approved in principle. Referred to Council to investigate with the aid of education and medical or ganisations having a similar interest e.g., the New York State Society of Pathologists the Joint Coun cil of Radiologists Pathologists, Anaesthesiologists and Physical Therapy Physicians as well as the Board of Registry of the American Society of Clinical Pathologists and the New York Academy of

It was coled that this be referred to the Subcommittee just appointed.

10 Business Surrey

The recommendation that a business survey of the greatly extended activities of the Society be made was referred to the Committee on Office Administra tion and Policies for study and recommendation.

#### War Memorial

'With respect to the report of the Finance Com mittee regarding the war memorial of the Society which is a proposal for the Society to finance the ad vanced education of the children of its members who died in the military service during World War II your Committee feels that this can only be financed by a special assessment for this purpose. Your Com mittee recommends that this matter be referred to the Council and Trustees for further study as we have no factual or actuarial knowledge as to its preent or ultimate cost.

After discussion.

It was roted that a Subcommittee of four (two from the Council and two from the Trustees) be appointed to study the matter with special emphasis as to what policies the House of Delegates really intended should be followed.

#### Medical Practice Committee

Resolved, we request that the Council of the Modical Society of the State of New York, through its Committee on Legislation be instructed to prepare and introduce legislation calling for the abolition of the Medical Practice Com mittee and the restoration of its functions to the

respective County Societies
Resolved we request that legislation be introduced in the New York State Legislature in the 1948 session to restore to the County Medical So-cleties of Greater New York the powers which they had under the compensation laws of 1935

Your Committee recommends approval of both of these resolutions. After discussion

It was roted that this be referred to the Legislative Committee

Conditions Governing the Relationships Between Hospitals and Specialists in Laboratory Medicine

Resolved that the House of Delegates of the Medical Society of the State of New York give cognisance to the existing situation and be it fur ther

Resolved that the situation be carefully stud ied by the Society with the avowed purpose of developing a new pattern of practice of the specialty of Laboratory Medicine in the hospitals placing such practice on the same broad basis as now gov erns the relationship of medical specialists with the institutions of this State and that a committee be appointed by the President with the ap-proval of the Council to carry out this study

which resolution was introduced at the request of the New York State Society of Pathologists Reference Committee has considered this resolution and after deliberation, recommends that in full realization of the fact that the problem of the labora tory men and their relation to the hospital has been presented to this House in many varied aspects in several resolutions over the years this resolution be approved in principle and that it be referred to the Council for action.

After discussion,

It was roted that this resolution be referred jointly to the Joint Committee of the Hospital Associa tion and the Medical Society and the Committee on Economics.

Communications -Letter of thanks from William Hale, Jr, dated May 20, 1947, was read by Dr An-

derton

Letter from Dr Ezra A Wolff, secretary, Medical Society of the County of Queens, dated May 2 1947, containing a resolution adopted at a special meeting, disapproving the Health Insurance Plan of New York, was read for information by Dr Anderton

Letter dated May 13, 1947, from Onondaga County Medical Society re State Society's attitude about the National Physicians Committee and its component State Committees After discussion.

It was voted that the Council has no objection to a component county medical society appointing a committee to cooperate with the National Physicians Committee, in its own area

Treasurer's Report Was Accepted

# Report of Delegates to the 1947 Meeting of the American Medical Association

To the Council—Gentlemen

The following members represented the Medical Society of the State of New York in the House of Delegates of the American Medical Association at Delegates of the American Medical Association at Atlantic City, New Jersey, June 9, 10, 11, 12, 1947 Thomas A McGoldrick, John J Masterson, Stephen R. Monteith, J Stanley Kenney, George W Kosmak, Thomas M D'Angelo, Harry Aranow, Louis A Van Kleeck, Scott Lord Smith, Walter W Mott, W P Anderton, Herbert H Bauckus, Albert F R Andresen, Clarence G Bandler, James R Reuling, Floyd S Winslow, Relight T B Todd, O. W. H. Mitchell, Edward R. Bandler, James R Reuling, Floyd S Winslow, Ralph T B Todd, O W H Mitchell, Edward P Flood, and Albert A Gartner

Also in attendance at the House of Delegates and at some of the meetings of your delegation were Louis H Bauer, Arthur J Bedell, Edward R Cunnific, Roy B Henline, Charles Gordon Heyd, Nathan B Van Etten, H. G Weiskotten, and Durch Anderson Etc.

Dwight Anderson, Esq Dr Floyd S Winslow was elected Chairman

The delegation met Sunday evening, June 8, 047 At this time Mr Royal Ryan of the New 1947 York Convention and Visitors Bureau, addressed us in regard to having the American Medical Association's Annual Meeting in New York City in 1948 or

Resolutions directed by the House of Delegates of the Medical Society of the State of New York, for introduction at the American Medical Association

House of Delegates were discussed

The resolution on Group Practice was assigned to Dr J Stanley Kenney for introduction This was referred to a Reference Committee which accepted it in principle, and the subject was referred to the proper Council of the American Medical Association

A resolution regarding Hospital Specialty Boards was assigned for introduction to Dr John J Master-The Reference Committee to which it was assigned considered this resolution in company with The House of Delegates other similar resolutions

took sympathetic action

A resolution on Teaching Medical Economics in Medical Schools was introduced by Dr James R Reuling at the request of his fellow delegates After digestion in a Reference Committee, the subject of this resolution was referred to the appropriate

A M A Board
Dr Walter W Mott, upon instruction from his fellow delegates, introduced our resolution regarding This received favorable action Nurses

However, a resolution regarding AMA Neina Releases, introduced by Dr. Harry Aranow, was defeated upon recommendation of the Reference Committee

Dr Herbert H Bauckus's resolution regarding Veterans Administration "Hometown" Care of Service-connected Disabilities received favorable vote

The delegation voted to request Dr Winslow to recommend to the Council that it undertake to establish a mechanism for editing resolutions in the House of Delegates of the Medical Society of the State of New York

A letter from Mr Archibald G Thacher, chairman, Citizens Committee for Military Training of Young Men, Inc, was discussed It was voted for

Dr Winslow to reply

The second meeting of the delegation was held Wednesday, June 11, 1947, after adjournment of the A M A House of Delegates At that time the candidates for elective offices in the American Medical Association, were discussed, the World Health Organization was discussed

It was voted that the chairman appoint a Committee of three to make arrangements for a proper meeting room for your delegation at the next meet-

ing of the American Medical Association

The last meeting of the New York delegation was held between the morning and afternoon sessions on Thursday, June 12, 1947 At that time the delegates agreed about which candidates they would support in the forthcoming election

During this meeting the following members of your delegation were assigned to Reference Com-

mittees

Hygiene and Public Health W P Anderton Legislation and Public Relations T A McGoldrick Medical Edu-(Chairman) G W Kosmak cation Miscellaneous business S R. Monteith On reports of Board of Trustees and Secretary A A Gartner

On reports of

Officers (Chairman) J R Reuling On Sections and Section

Work (Chairman) R B Henline Scott Lord Smith

It gives me pleasure also to report that Dr Thomas A McGoldrick was elected Vice-President of the American Medical Association for 1947 to 1948 unanimously and without an opposition candi-

> Respectfully submitted, FLOYD S WINSLOW, M'D CHAIRMAN

It was voted that felicitations be sent to Dr Mc-Goldrick on his being elected Vice-President of the A.M A

In regard to the recommendation that the Council undertake to establish a mechanism for editing resolutions in the House of Delegates of the Medical Society of the State of New York,

It was voted that a Committee to consist of the Speaker, Vice-Speaker, and Secretary, be appointed to work out some recommendation relative to this, and submit it later to the Council in time for it to be incorporated in the Annual Report

It was voted that the matter of obtaining a proper meeting room for the delegation at the next meeting of the A.M 1. be approved and that the Trustees be requested to appropriate if necessary an amount not to exceed \$200

### Activities of Committees

Constitution and Bylaws.-The Council acted on a set of bylaws sent by the County of Fulton for approval. Section 10 provides that candidates to be eligible for election to membership shall have practiced medicine in the County of Fulton or in the ad joining county which has no county medical society for at least one year exclusive of internal lo

This section was disapproved as it was felt that a man should be entitled to become a member of a medical society upon obtaining his licensure The balance of the proposed bylaws were approved with minor corrections

Convention Committee -- Dr Carlton E. Wertz

Chairman, made the following report

The 141st Annual Meeting of the Medical Society of the State of New York took place at Buffalo from May 5 through 9 1947 The Civic Memorial Auditorium was the headquarters.

Attendance

1 316 Members 254 Guests 401 Exhibitors 1 971 Total

Teaching Day A special teaching day program was arranged by the Committee on Public Health and Education, Dr O W H Mitchell Chairman for Tuesday, May 6 This was woll attended. Scientific Program Approximately 125 papers

were read. Both General Sessions were well at tended The joint meeting of the Section on Medicine and the Section on Surgery drew a large attend ance for the panel discussion on poptic ulcer round table discussion on cases of proven chest pathology in the Section on Radiology evoked a lively discussion. The Section on Anesthesia presented a symposium on the use of procedure intravenously the Section on Dermatology and Syphilology a panel discussion on syphilis the Section on Urology a symposium on bladder tumors. All of these proved of much interest.

Scientific Exhibits The space available for the scientific exhibits was larger than in provious years This allowed for a greater number of exhibits and more space for each one than in former years exhibits were well presented and well attended by

members and guests.

The Scientific Award Committee awarded a first prize a second prize and honorable mention in two classes clinical and scientific.

Technical Exhibits The Technical Exhibits were

also well attended

Banquet The Banquet and Annual Meeting at the Statler Hotel was attended by approximately 400 people. A feature of the banquet was the presentation of certificates to members of the Society who had been in practice for fifty years or more Seventy-one members were guests of the Society and took part in this ceremony

Woman's Auriliary The Woman's Auxiliary had rooms at the Statler Hotel for all their activities The ladies expressed pleasure at the facilities pro-

vided for them.

A role of thanks was extended to the Committee.

Dr Anderton reported that the Waldorf Astoria and the Pennsylvania Hotel had both been investigated with the idea of finding out which one would be the better to hold our 1948 Annual Meeting

After discussion.

It was roled to accept the offer of the Pennsylvania Hotel

Committee on Economics -Dr Werts Chairman referred to the following report of the Director of the

Bureau of Medical Care Insurance
April 4 1947 The Director attended a meeting of the Subcommittee on Medical Expense Insurance Dr A II Asron Chairman, at the Hotel Commo-dore New York City The Committee reviewed suggested standards of approval of New York State medical care plans by the Medical Society of the State of New York, and it was recommended they be brought before the Council through the Council Committee on Public Relations and Economics for approval The Council approved the standards which were later adopted by the House of Delegates at its Annual Moeting in Buffalo May 5 1947

April 8 1947 Mr Farrell addressed the Wo-

man's Auxiliary of the Medical Society of the County of Ulster at Kingston New York

April 16 1947 Mr Farrell met with Mr W A. Milliman, associate actuary and Dr Harry Unger leider, medical director of the Equitable Life Assur ance Society to discuss the exchange of statistical data regarding enrollment and benefits offered by the voluntary nonprofit and commercial plans.

April 22 1947 The Director appeared before the Erio County Medical Society and presented a report on the status of the Western New York Medical

Plan, Buffalo

1pnl 29, 1947 Mr Farrell addressed the Woman's Auxiliary of the Medical Society of the County of Groene, at Catskill

The week of May 5 to 9 1947 Mr Farrell attended the Annual Meeting of the Medical Society of the State of New York, at Buffalo At his aug gestion resolutions were introduced for approval by the Medical Society of the State of New York of the Northeastern New York Medical Service Inc. Al bany, Genesce Valley Medical Care Inc Roch-ceter and Central New York Medical Plan Syra

ouse Approval was granted by the House
A paper was presented by Mr Farrell, at a General Session on May 9 1947 entitled What the
Medical Care Plan Means to the Doctor and the

Public.

May 5 1947 On invitation of Dr Harvey Hoff man Mr Farrell spoke before the senior medical students of the University of Buffalo, behool of Medicine, on Voluntary Medical Care Plans. May 23, 1947 Mr Farrell attended the Regional

Conference of the Council on Medical Service of the American Medical Association in Pinladelphia

During the week of June 7 to 12 1947 the Director was present at the Annual Convention of the American Medical Association in Atlantic City

An informational pamphlet on the progress of New York State medical care plans, prepared for dis-tribution at the Society's Annual Meeting, has also been sent in quantity to the six voluntary plans in the State for further distribution to their participating physicians to better acquaint them with the voluntary nonprofit insurance movement throughout the State.

The report was accepted.

Finance Committee.-Dr Albert F R. Andresen, Chairman presented the revised budget for the latter half of 1947

It was voted that this budget be recommended to the Board of Trustees.

Committee on Office Administration and Policies. -The Committee submitted a report on routine matters, and is continuing its studies in regard to improving the management and policies of the running of the office

Committee on Public Health and Education -Dr O W H Mitchell, Chairman, reported as fol-

May 6, 1947 At the request of the New York State Department of Health, a joint meeting of the Council Committee on Public Health and Education and the Subcommittee on Cancer was held in Buffalo at the time of the Annual Meeting present at this session were some of the officers of the Medical Society of the State of New York and representatives of the State Department of Health and the American Cancer Society

The chief subject for discussion had to do with cancer detection clinics or service, and the conclusion was that the requirement for such an activity should he drawn up and submitted to us for consideration. This report has not as yet been received from the

State Health Department

June 6, 1947 In New York City a meeting of the Council Committee on Public Health and Education was held Present were some of the of-ficers of the Medical Society of the State of New York and representatives of the State Department This meeting was held to consider of Health the syphilis control program, (b) plasma and whole blood transfusion by nurses, (c) other matters
(a) Syphilis Control Program This will be

This will be changed due to the new methods of treatment, and will involve the distribution of penicillin to general practitioners, which will require a change in our educational program The director of the Division. Dr

Bloomfield, will submit his program to us

(b) Plasma and Whole Blood Transfusion by The question arose in one county about nurses being responsible for blood transfusions was agreed that a nurse could not possibly be re-

sponsible for that procedure
June 14, 1947 In New York City your Chairman attended a meeting of the Rheumatic Fever Advisory Committee of the New York State Department

of Health

Dr Swift, of New York City, is Chairman of this Committee, and we are trying to develop a program that will be satisfactory to the medical profession. This involves federal funds from the Children's Bureau, and it was agreed to by the Advisory Committee that when the program is developed, it is to be submitted to the Committees who are concerned

with this particular activity

Public Health Activities Dr Gordon D Hoople, Chairman of the Subcommittee on Hard of Hearing and the Deaf, read a paper on the conservation of hearing program in New York State in the Eye, Ear. Nose and Throat Section of the Medical Society of the State of New York. This paper outlined the pro-posed plan which the Committee is attempting to establish throughout the State It was well received, and, in addition, created newspaper comment throughout the State, particularly in the metropolitan dailies

Cancer The following paragraph appears in a recent communication received by the Chairman of the Council Committee on Public Health and Education from the director of the Service Division of the American Cancer Society, Charles S Cameron,

M D

"The American Cancer Society desires to distribute a copy of the postgraduate medical education course outline book to each of its divisions as a model for them to follow"

In compliance with this request, 50 copies of the 1946-1947 Course Outline Book were mailed to Dr Cameron

Postgraduate Instruction Postgraduate instruction has been completed in the following county Cortland, Fulton, Ma l, St Lawrence, Sar eca, Sullivan, Tioga, Madison, medical societies Nassau. Rockland, Saratoga, Schenectady, Seneca. Tompkins.

Instruction is being given in the following county medical Societies Cayuga, Oswego, and Warren

Arrangements have been completed for instruction to be presented in the fall in the following county medical societies Broome, Orange, and Oswego

Because we were so late in having the Course Outline Book printed last year, only a supplement will be distributed for 1947-1948 Letters have been Letters have been sent to those physicians who have arranged material for inclusion in the book requesting them to let us know of any changes desired in their announcements

The report was accepted

Committee on Public Relations -According to a recommendation approved by the Council April 10 and the House of Delegates May 6, the name of this Committee has been changed from the Council Committee on Medical Publicity to the Council Committee on Public Relations

News Releases concerning teaching days and other events sponsored by the Committee on Postgraduate Education were sent to the papers of 12 counties
These counties were Broome, Chemung, Cortland,
Madison, Nassau, Rockland, Schuyler, Steuben,
Sullivan, Tioga, Tompkins, and Ulster
Mr. Dwight Anderson, Mr. Edgar L. Cook, and
Mr. Thomas Walsh mot with Stets Separate Corey

Mr Thomas Walsh met with State Senator Corey Mills, who suggested that we prepare a brochure especially for use with the Legislature explaining the origins, functions, and activities of the State Medical Society He said the Legislature had no conception of the contributions that the State Medical Society makes to the health and welfare of the public and should be so informed This brochure is in prepara-

The award of 71 commemorative certificates for more than fifty years of the practice of medicine to member physicians of the Society featured the 141st Annual Meeting, May 5 to 9, in Buffalo hundred and sixty additional certificates were mailed to fifty-year practitioners throughout the State who were unable to attend the banquet

Lafe science researcher Geraldine Lux and photographer Werner Wolff covered the fifty-year doctor event. Nine news reporters covered the entire meeting, and two photographers covered various

events

Two press rooms were maintained, one at the Convention Hall during the day and one at the Hotel Statler after business hours

Mr Anderson and Mr Cook arranged with Mr Walter Law, of NBC, for Dr Morris Fishbein to make a recording concerning the A.M.A commemorative stamp which was used on a stamp radio pro-

gram from 9 45 to 10 00 A.M on Saturday, June 7
Mr Anderson, Mr Walsh, and Mr Cook attended the A M A meeting June 9 to 13 in Atlantic

City

Mr Cook, Mr Walsh, and Mr Farrell assisted Dr Bauer and Dr McGoldrick in preparing a brief and supporting statistical documents for a Senate hearing on the National Health Bill, S 545, the Taft-Smith-Ball-Donnell Bill, June 5, at which Dr McGoldrick and Dr Winslow testified before the Senate Committee on Labor and Public Welfare

The report was accepted Publication Committee

Increase in the Subscription Price of the Journal The Committee submitted a report showing that the Journal would continue to show a deficit on cash subscriptions if the price to nonmembers was not in creased.

It was roled that subscription rates to nonmembers be \$5.00, and that the allocation from members dues be \$2 50 to go into effect November I 1947

Future Issues of the Journal Gradually with new facilities being made available in the printing plant the Journal should reach members at the approxi mate date announced on the cover. In view of the increased circulation due to a larger membership the restricted allotment of paper has resulted in a smaller individual journal but there is a prospect of a more satisfactory supply of paper this fall. It will be necessary to omit certain sections during the summer in order to advance the publication of the many man uscripts now in our files including those from the annual meeting. The hoped-for improvement in the makeup of your journal must be deferred until the paper shortage can be overcome The report was accepted

Woman's Auxillary -Dr Beckman Chairman of the Advisory Committee to the Woman's Auxiliary read a report, dated June 4 1947, from the retiring President Mrs. Madden in which she gave a resume of the expenses for the year and their allocation against the \$1 000 which was appropriated.

Committee on Workmen's Compensation —Dr

J Stanley Lenney Chairman reported Legislation The Governor signed the Condon Bill permitting voluntary hospitals to obtain a laboratory or bureau license in connection with x-ray examinations The value of this license is apparent when one takes into consideration the provisions of Section 13(a) "Nothing in this section shall be con strued as preventing the employment of a duly au thorized physician on a salary basis by an authorized compensation medical bureau or laborator;

Such laboratory or bureau may submit bills for services rendered by employed physicians. A num-ber of commercial laboratories exist and employ qualified roentgenologists on a salary basis. are rendered in the name of the laboratory giving the name of the qualified roentgenologist and are pay-

able to the laboratory

It, therefore would seem that a hospital employ ing a physician on a salary basis having obtained a laboratory or bureau license from the Workmen's Compensation Board, may render bills and collect for services performed by salaried roontgenologists.

It is important to review other provisions of the law which affect the rights of a hospital to render medical and surgical services in connection with the above amendment. Section 18-f of the Workmen e Compensation Law states unequivocably (1) fees for medical services shall be payable only to a phy sician or other lawfully qualified person permitted by Section 13-b of this chapter to render medical cars under this chapter Hospitals shall not be entitled to receive the reumeration paid to physicians on their staff for medical and surgical services. Section 13-d of the Workmen & Compensation Law. concerning the removal of physicians from lists of those authorized to render modical care prohibits a physician authorized under the Workmen's Compen sation Law from dividing, transferring assigning, rebating, splitting or refunding a fee for medical care and other medical services including x ray and laboratory examinations except that reasonable pay

ment not exceed 331/1 per cent of any fee received for x-ray examination, diagnosis or treatment may be made by a physician to the hospital furnishing fa cilities for x ray examination, diagnosis or treatment A similar provision exists in Section 1264 of the Education Law

Are these latter provisions in conflict with the amendment to the law which gives to voluntary hospitals the same right to practice roentgenology as was given to lay persons or corporations (Section 13(a)) in the original anendment of 1935 provided that these lay persons or corporations employ a duly authorized roentgenologist to supervise and operate the laboratory? It seemed to be the clear intent of the original law that only a physician could render medical and surgical service and be paid therefor The insertion of the provision in Section 13(a) au thorizing lay-owned x-ray laboratories was made after the original bill was introduced in 1935 and as a result of the intervention of pressure groups and particularly of a certain commercial inhoratory in New York City This nullified the beneficent provisions limiting medical and surgical service to duly qualified and authorized physicians. We protosted at that time refusing to recommend said commercial laborator, for lie using, but a license was nevertheless issued on appeal to the Industrial Council of the

Department of Labor

We are dealing with two antithetic concepts. The first enables lay-owned laboratories or hospitals to provide certain types of medical care such as x-ray and laboratory services and to be paid therefor. The second concept is that these services being medical care can only be rendered by a physician under the law in accordance with our cone pt of the practice of medicine. We can only anforce our view point and seek remedial legislation to clear up these ambiguities if we can show and prove that x-ray and other services like anosthesia pathology and physical medicine are the practice of medicine At present we are not on safe legal ground in as arting that The Court of radiology is the practice of medicine Appeals decision in the Sausser case is precedent for Until and unless this precedent the opposite view is removed either by court action or by substantive changes in the Medical Practice Act and in the Workmen's Compensation and Lducation Laws declaring that radiology and the other specialties are definitely the practice of medicine there is little chance of clearing up the am aguities and redun-dancies in the law which are so detrimental to the proper administration of the Workmen's Compensa tion Law and to the creation of harmonious and equitable relations between hospitals and the mediral profession.

We have gone one step in the right direction. We have an agreement with the Hospital Association to the effect that the four specialties mentioned are the practice of medicine If this agreement was written into the law as we have endeavored to do for a num ber of years, it would be easier than to amend the Workmen & Compensation Law to remove the ambiguittee above mentioned and then go on to creating a modus essends between hospitals and the specialists mentioned in regard to contracts salaries, and other matters which are today the subject of continued discussion and perplexity

We again draw to the attention of the Council the necessity of taking the fundamental step of amend ing both the Workmen's Compensation Law and the Education Law to include definitely these four specialties as the practice of medicine, as a first step Delay may be dangerous in impeding or halting the encroachment of hospitals in the practice of

Despite our disapproval and protests the bill to amend the Workmen's Compensation Law in relation to the review, revision, or revocation of a physician's authorization introduced in this session of the legislature was enacted into law. This revision amends subdivision 2 of Section 13-b of the Workmen's Compensation Law as follows

"The medical practice committee, or the medical society or the board designated by it, or the board as otherwise provided under this section, may from time to time review the qualifications of any physician as to the character of the medical care which such physician has theretofore been authorized to render under this chapter and may recommend to the chairman that such physician be authorized to render medical care thereafter of the character which such physician is then qualified to render On such advisory recommendation the chairman may review and after reasonable investigation may revise the authorization of a physician in respect to the character of medical care which he is authorized to render If the medical practice committee or the medical society or board recommends to the chairman that a physician be authorized to render medical care under this chapter of a character different from the character of medical care he has been heretofore authorized to render, such physician may appeal from such recommendation to the medical appeals unit of the industrial council "

It will be noted that either the Medical Practice Committee operating in the four New York Counties or the Medical Society Compensation Committee having jurisdiction elsewhere in the State may from time to time review qualifications given to a physician and recommend to the Chairman that his rating be changed ostensibly to conform to his then On such advisory recommendation qualifications the Chairman of the Workmen's Compensation Board may review and after reasonable investigation may revise the authorization of a physician

There is no provision either initially by the Medical Practice Committee or the Medical Society for requiring a hearing of the physician whose rating is to be changed or revised However, the Chairman of the Workmen's Compensation Board after receiving merely advisory recommendation need only investigate and not afford the physician a hearing If after acting on the recommendation of the Medical Practice Committee or the Medical Society, the Chairman of the Board gives the physician a rating changing the character of the medical care he was originally authorized to render, the physician has the right of appeal to the Medical Appeals Unit of the Industrial Council

It is presumed that the amendment applies only to a reduction in the scope, range, or authorization of the physician to render medical care, since if his rating were changed to include a greater range, as now already provided for in the law, there would be no need for an appeal So it can be taken for granted that the amendment was introduced to permit the Chairman of the Board to change the ratings of specialists and qualified physicians for one reason or another, the precise reasons not being given in the

Our protests and disapproval of this amendment were based principally on the fact that a physician has no right to a hearing either before the Medical Society or the Medical Practice Committee before his rating is changed. The physician is thus deprived of an important and valuable right once given him after due process without an opportunity to de-It is to be presumed that the fend his position Chairman of the Workmen's Compensation Board although she is not required to hold a hearing, will make such investigation as she deems proper Chairman is, however, not required to hold a formal

Then an appeal may be taken to the Medical Ap-

peals Unit of the Industrial Council

Let us, therefore, investigate the authority of the Industrial Council under the present law The decision and recommendation of the Medical Appeals Unit of the Industrial Council shall be advisory only to the Chairman and shall not be binding or conclu-Under the provisions of the original sive upon him amendment to the Workmen's Compensation Law, setting up the Industrial Council, the decision of the Medical Appeals Unit in all matters within their jurisdiction was final, binding, and conclusive upon the Industrial Commissioner When the workmen's compensation division was separated from the office of the Industrial Commissioner and a Workmen's Compensation Board and a Chairman thereof set up in 1944, it was provided that the findings of the Medical Appeals Unit of the Industrial Council would only be advisory to the Chairman of the Workmen's Compensation Board Therefore, a physician taking an appeal over the findings of the Chairman of the Workmen's Compensation Board changing his rating and depriving him of certain privileges and property rights, actually is at the mercy of the Chairman of the Board Is it likely that once having gone so far as to make a finding in regard to the physician's qualifications based upon her investigation, the Chairman will be influenced by a body which has only advisory power and whose findings are not, as they should be, binding and conclusive upon her? It is as though a person being aggrieved at a verdict of a judge or jury of the lower court, and having the right of appeal to a higher court, finds that the decision of the appeals court is only advisory to and not conclusive upon the lower court. We believe this to be contrary to good practice and unjust This amendment should not be permitted to remain on the statute books as it deprives a physician of his day in court both initially and on appeal It is dictatorial, inequitable, and unjust, and deserves the scrious consideration of the Council

The Council should take into consideration the advisability of increasing the size of the Workmen's Compensation Committee Since Council committees are limited to three, it would be necessary to appoint an advisory committee of, say, three members, making the committee six in number various sections of the State should be represented on this Committee It is important that members appointed to this committee have a genuine interest in and understanding of workmen's compensation problems if they are to be of any service to the committee in the consideration of the numerous mat-

ters that are constantly before it

Dr Kenney continued his report by stating that at the April 10, 1947, meeting of the Council, a resolution presented by the Medical Society of the County of Albany had been read for the information of the Council The gist of this resolution was that the members of the Albany County Society were going to charge fees above the minimum schedule, and arbitrate when necessary Also a letter was sent and arbitrate when necessary Also a letter was sent to Mr Martin on May 20 from the Onondaga County Medical Society requesting an opinion on the legality of such procedure Since that meeting we have had the announcement to the House of Delegates of the proposed increase in fees.

After discussion

It was roted that the Council of the Medical Society of the State of New York go on record that it would disapprove of any county society taking any action to bring cases to arbitration under the Workmen's Compensation Law except such cases as those in which unusual service was rendered inasmuch as negotiations for changing the existing minimum fee schedule are in progress

Committee Appointments.-Dr Bauer presented the following list of committee appointments which

were approved by the Council

It was roted that the President be empowered to appoint another Subcommittee to assist the Legislative Committee, designation to be made after consultation with Dr. Aranow and Dr. Mitchell. It was roted that the nomination of Session Of

ficers be postponed until a future date.

Gerlatrics.—Dr Bauer read a letter from Dr C Ward Crampton under date of June 4 1917 suggest ing that organized medicine take the leadership in the field of geriatrics and that the State Society ap-

point a committee or subcommittee to put the mat

ter forward in the medical field It was voted that this be referred to the Committee on Public Health and Education for a study

FOR THREATENED AND HABITUAL ABORTION

In the treatment of habitual abortion, "virtamin E should be used because it appears to offer great hope in salvaging pregnancies that would otherwise habitually abort." Ephynal Acetate—the Roche vitamin E preparation (\*-tocopherol acetate)—is particularly suitable for the treatment of habitual and threatened abortion because it is stable, of unvarying potency and purity and well tolerated even in large doses and over long periods of time. Its freedom from side reactions is of signal value in all disorders amenable to vitamio-E therapy. Available in tablets of 3 10 and 25 mg

Continued from page 19081

of laboratory medicine in the hospitals, placing such practice on the same broad by as now governs the relationship of medica. with the institutions of this state, and that mittee be appointed by the President with the approval of the Council to carry out this study"

Splaker Andresen Referred to the Reference Committee on New Business B, of which Dr Frederick W Williams is the Chairman

Section 50 (See 110)

#### Care of the Chronically Ill

DR EDWIN L HARMON, Westchester This concerns the care of the chronically ill

"Whereas, statistics show that we have an aging population and therefore that the problems of geriatrics must receive greater consideration in future planning, and
"Whereas, studies have indicated that stand-

ards of care for the chronically ill in private nursing homes, now caring for many of the aged, are inadequate and for the most part very costly, and "Whereas, the Governor's State Health Pre-

paredness Commission has recognized this need and has recommended the establishment of several small teaching hospitals for the treatment of the chromically ill to be scattered throughout the state, and

"Whereas, these hospitals cannot meet the present need but will serve as demonstration projects, now, therefore, be it

"Resolved, that the Medical Society of the State of New York should interpret this need to the physicians and the public and should urge that the construction of separate buildings or special wings for the care of the chronically ill be included in the building programs of voluntary general hospitals throughout the state "

Referred to the Reference SPEAKER ANDRESEN Committee on Report of the Council, Part VI, of which Dr Edward P Flood is Chairman

Are there any further resolutions? There was no response

There being no further SPEAKER ANDRESEN resolutions that anyone wishes to introduce at the present, I want to appeal to you again to get over to the reference committee meetings and argue things out over there first instead of doing it on the floor of the House

Section 51 (See 4)

#### Change in Reference Committee Appointment

I wish to announce a SPEAKER ANDRESEN change in the Reference Committee on New Business B There will be a new member, Dr Alfred M Hellman, of New York, to replace Dr Harold B Davidson, who is not here

The House will be in recess until 9 o'clock tomorrow morning

At 1 PM a recess was taken, until Tucsday, May 6, 1947, at 9 00 A M

# A fine introduction to chicken

Beech-Nut Chicken Soup

#### Good midday meal

The older infant will enjoy Chicken Soup at noontime. With a vegetable and a dessert it makes a satisfying nutritious lunch Lower calorically than cereal it might replace cereal at supper for the overweight child.

#### INGREDIENTS

Chicken broth enriched farina, carrots celery chicken salt onions and yeast.

Beech-Nut Foods for Babies meet the high standards of the Council on Foods and Nutri tion of the American Medical Association All nutritional statements in Beech Nut advertising also have been accepted

# Beech-Nut

Foods for Babies

#### Fine, full flavor

Cooked in closed cookers to extract and retain natural flavor, Beech Nut Chicken Soup has a homecooked taste. Small pieces of chicken meat add to the richness of the vellow broth

PACKED IN GLASS
A most important fact to remember when you recommend baby foods to mothers

#### Second Annual Postgraduate Course in Diseases of the Chest

THE American College of Chest Physicians is sponsoring a second annual postgraduate course in diseases of the chest to be held during the week of September 15 to 20, 1947, at the Municipal Tuberculosis Sanitarium, Chicago, Illinois
The emphasis in this course will be placed on the

newer developments in all aspects of diagnosis and treatment of diseases of the chest

The course will be limited to 30 physicians Further information may be secured at the office of the American College of Chest Physicians, 500 North Dearborn Street, Chicago 10, Illinois.

one way

to control

a cough

18

to stop

#### the coughing

Coughing is often the cause of a vicious circle. The first cough irritates the traches or larynx, and thus excites the nerve end ings. Recurrent cough impulses cause further irritation and still more severe coughing

Inhaled through the MOUTH the vapor\* from Eskay s Oralator—by local action on nerve end ings—arrests the cough impulse where it originates. Thus it gives the patient relief, breaks the vicious circle, and hastens recovery

Your patients will be grateful to you for prescribing this effective, outstandingly convenient oral inhaler

Smith Kline & French Labora tories, Philadelphia.

"(The active ingredient in Esbay" Oraleter is the sympathenimatic compound 2 amino 6mathytheptone, S. K. F.)

#### Whitney Foundation for Rheumatic Fever Study

THE Helen Hay Whitney Foundation for Rheumatic Fever Research was opened on July 7 Dr T Duckett Jones, who is on leave from the House of the Good Samaritan in Boston, is medical director of research activities

The purpose of the foundation, which will have temporary offices at New York Hospital, is to stimulate and help finance basic research which may throw more light on the cause of rheumatic heart fever

Creation of the new foundation was announced by a distributing committee which included Mrs Charles Payson, John Hay Whitney, Frederick H Trask, Jr, and William Harding Jackson

#### **PERSONALITIES**

Dr George J Zippin, of Schenectady has opened his office in Schenectady, limiting his practice to the treatment of diseases of the skin

Dr Zippin served four and a half years in the armed forces. He was chief of the dermatology section of the 224th General Hospital which served in the United States, European, and Pacific theaters. He is a diplomate of the American Board of Dermatology and Syphilology.

Assignment of three New York doctors as commanding officers of three organized reserve medical groups in New York was announced in June by Gen Courtney H. Hodges, head of the First Army

Col Joseph Haas, of New York City, will command the 139th Organized Reserve Medical Group, Manhattan. Col Herman Reinstein, of Brooklyn, has been chosen as commanding officer of the 146th Organized Reserve Medical Group, Brooklyn Col James H Kidder, of the Bronx, will head the 154th Organized Reserve Medical Group in the Bronx

Dr Frederick E Squires, of Livonia, celebrated his eighty-second birthday on August 17 and his fifty-first year of professional service in that community Dr Squires was among the group of New York doctors who were awarded certificates by the Medical Society of the State of New York in recognition of fifty years of medical practice at the Society's Annual Meeting in May

Dr Squires was born in Churchville, New York, August 17, 1865, and after being graduated from Cazenovia Seminary, he entered the University of Buffalo, School of Medicine He interned at Buffalo General Hospital, and later did postgraduate work at the New York Lying-In Hospital, New York Post-Graduate School, and the Massachusetts General Hospital For twelve years he was health officer of Livonia

During the half century of his practice, Dr Squires recalls two serious epidemics, one of typhoid in 1897, and the flu epidemic in 1918. During the latter epidemic, in one day he made 96 calls. Dr Squires estimates that he has assisted at approximately 1,500 births.

He is in excellent health and continues to be active in his practice

Dr Oswald R Jones, of New York, was appointed in July by Governor Thomas E Dewey to a fiveyear term as chairman of the new State Tuberculosis Committee

The Governor also appointed four other physicians on the five-member committee, which will act in an advisory capacity to the State Health Commissioner They were Dr Edward M Packard, Saranac Lake, four years, Dr John E Mosely, New York, three years, Dr James R Reuling, Bayside, Queens, two years, and Dr William McCann, Rochester, one year

Dr Byron D St John, of Port Washington, New York, has returned to the practice of medicine after an absence of six months, due to illness

Dr Anthony Bassler, New York City, received first prize in oil paintings for his "River Styx" at the Atlantic City meeting of the American Physicians Art Association He also won first prize in humorous poems and permanent possession of the Secretarie's cup at the Physician's Literary Guild

Dr James W Smith, of New York City, read a paper on "Ophthalmologic Office Procedure" before the Reading, Pennsylvania, Eye, Ear, Nose and Throat Society on June 18, 1947

Dr Louis S Goldstein, of Yonkers, New York, who for fifteen years has been associated with the Childhood Tuberculosis Clinic at the Vanderbilt Clinic, recently was elected to membership in the American Academy of Tuberculosis Physicians and the Medical Section of the American Trudeau Society

The Maimonides citation for "outstanding scientific scholarly achievement" recently was awarded to Dr Israel S Wechsler, of New York City, by the Jewish Theological Seminary of America, New York City

#### Refresher Course in Medicine at City Hospital

'ITY HOSPITAL, New York City, announces that the next refresher course will be given from October 6 to November 7, 1947 The hours are 9 to 12 AM on Monday, Wednesday, and Friday, and 2 to 4 PM on Tuesday and Thursday Classes are held at the Welfare Island Dispensary

The course is a comprehensive review in internal medicine and the allied specialties designed to meet the needs of the general practitioner and the medical Emphasis is placed throughout on the veteran

diagnosis and treatment of the disorders commonly encountered in general practice The newer diagnostic and therapeutic procedures are described and evaluated in the light of clinical experience. Students are also permitted to make rounds on the wards of City Hospital by special arrangement.

There is no tuition fee. Request for applications.

should be addressed to Dr Milton B Rosenblatt, Welfare Island Dispensary, 80 Street and East End Avenue, New York 21, New York.

#### News Notes

Establishing a new record, the New York Hospital provided care for 72,271 patients last year, the Society of the New York Hospital announced re-

cently in its 1946 annual report

Covering the hospital's 175th year of service, the report shows the city's oldest hospital provided hospitalization for 24,324 patients in the private, semiprivate, and ward services, an increase of 1,843 over the previous year, and 47,947 patients received medical attention through clinic and other facilities available to ambulatory patients, an increase of 4,281 over 1945

A large number of returning veterans enabled the hospital to staff adequately the many services and clinics However, the opening of new beds was held up due to the shortage of nurses These new beds eventually will raise the total number to 1,532 including those at the New York Hospital-Westchester Division, the psychiatric hospital maintained by the

society at White Plains

The first professorship in cancer in any medical school has been established at the Cornell University Medical College With an annual endowment of \$15,000 for five years, it represents the first allocation of funds from the 1947 campaign of the New York City Committee of the American Cancer Society

civilian general hospital in this country, have been formally opened at Bellevue Hospital by Mayor O'Dwyer They are patterned after the rehabilitation services of the Army and Navy, and the facility was described by Dr Edward M Bernecker, New York City Commissioner of Hospitals, as "medical history in the making"

Columbia University has joined the Institute r the Crippled and Disabled in an operating affiliation to train physicians, nurses, technicians, and social workers for a large-scale program for rehabilitation and re-education of the disabled, it was announced by Dr Frank D Fackenthal, acting director of Columbia, and Walter Ewing Hope, president of the Institute

Because of a steadily increasing demand on facilities, St Luke's Hospital, New York City, must expand and improve its services, according to the hospital's eighty-eighth annual report A total of \$7,500,000 is needed for the planned expansion

Lincoln Cromwell, president of the hospital, cited a demand for more space in the outpatient department, additional clinics, an obstetrical service, a diagnostic clinic, clinical and research laboratories, and more extensive accommodations for private and semiprivate patients He said it was

Two new rehabilitation wards, the first in any

necessary also to modernize the older buildings and to acquire new and up-to-date equipment

St Luke's Hospital has recently become affiliated with Columbia University for the teaching of medical students

During the past year 26,105 patients were served by the Hospital for Joint Diseases, New York City, and its country branch in Far Rockaway, according to the fortieth annual report, recently released by Frederick Brown, president of the hospital The number included 5,872 bed patients and 20,233 ambulatory patients The hospital beds were fully occupied, Mr Brown said, and on the average day during the entire year there have been 200 bed patients waiting to be admitted to the hospital.

The Hospital for Joint Diseases added a new service, the Cancer Prevention and Detection Center, in June of 1946, and late in 1945 established a School of Practical Nursing, with a one-year course of training, which has already eased the nursing shortage in the hospital

A children's adjustment clinic to handle behavior problems of children and parents, will be opened soon at the out-patient department of Beth David Hospital, New York City Dr Ernest Harms, editor of the journal, The Nervous Child and Handbook of Child Guidance, has been appointed director of the new clinic

#### At the Helm

Appointment of Dr Marion B Sulzberger as director of the department of dermatology and syphilology of the New York Skin and Cancer Unit, New York City, and professor of clinical dermatology and syphilology of the New York Post-Graduate Medical School, was announced in July He succeeds Dr George Miller MacKee, who is retiring and has been named professor emeritus of the medical school

Dr Robert F Loeb has been appointed Bard professor of medicine and executive officer of the Department of Medicine at the College of Physicians and Surgeons of Columbia University and Director of the Medical Service at Presbyterian Hospital

Dr Loeb succeeded Dr Walter W Palmer, who had occupied the post since 1921, and who is now professor emeritus of medicine at Columbia University and a consultant of the Presbyterian

Hospital

Dr Loeb, who received his medical degree from Harvard in 1919, served on the staffs of the Massachusetts General Hospital and the Johns Hopkins Hospital and later joined the Presbyterian Hospital, becoming an instructor in the College of Physicians and Surgeons During the war Dr Loeb served as consultant to the Office of Scientific Research and Development and as chairman of the Board for the Co-ordination of Malarial Studies Recently he served as chairman of the Board of Review of the United States Atomic Energy Commission

Dr Leon Ginzburg has been appointed director of surgery at the Beth Israel Hospital, New York City He will assume this post on October 1

City He will assume this post on October 1
A native New Yorker, Dr Ginzburg was graduated from the College of Physicians and Surgeons, Columbia University, in 1920, and continued his education abroad under an Emanuel Libman Fellowship in surgery and pathology During the war, Dr Ginzburg served as assistant chief of the surgical service of the Third General Hospital, and as chief of the surgical service of the 235th General Hospital and the 25th General Hospital of the US Army

Dr Altred J Vignec, medical director and

pediatrician-in-chief of the New York Foundling Hospital, has been appointed director of pediatries at St Vincent's Hospital, New York City

Dr Burton L Zohman, of Brooklyn, has been elected attending physician on the Long Island College Division of the Kings County Hospital in Brooklyn, and was appointed associate professor of clinical medicine at the Long Island College of Medicine

Dr Irwin Philip Sobel, associate pediatrician at the Lenox Hill Hospital, New York City, has been appointed assistant clinical professor of pediatrics at the New York University, College of Medicine.

Dr Edmund Prince Fowler, Jr, succeeds Dr John Devereux Kernan as professor of otolaryngology and director of the ear, nose, and throat service at the Columbia-Presbyterian Medical Center He was a member of the Presbyterian's Second General Hospital Unit during the recent war and was a special consultant in ear, nose, and throat to the Air Surgeon

A graduate of Dartmouth, Dr Fowler received his medical degree as well as a medical science degree at the College of Physicians and Surgeons, New York. His internships were served at Presbyterian Hospital, where he has been assistant attending otolaryngologist since 1938. He is editor of the loose-leaf textbook, Medicine of the Ear. He is president of the Audiology Foundation, a member of the Committee on Hearing of the National Research Council, a fellow of the American Otological Society, and a member of other general and specialized societies including the International Collegium Otolaryngologicum

Dr Harold A. Abramson, assistant professor of physiology at the College of Physicians and Surgeons, Columbia University, and associate physician for allergy, the Mount Sinai Hospital, New York City, has been appointed active consulting physician for allergy at the Seaview Hospital, Staten Island.

# Remarkable results

In a clinical study extending over a period of a year, Long\* used Edrisal as the sole medication in treating 630 employees for dysmenorrhea Results were dramatic He concluded, "We use it [Edrisal] with the knowledge that nine out of ten sufferers will get the relief they seek"

Edrisal combines the recognized analgesics—acetylsalicylic acid and phenacetin—with the unique anti-depressant, Benzedrine Sulfate. Consequently, it not only relieves the pain during the menstrual period, but also combats the accompanying psychic depression

Best results are usually obtained with a dosage of *two* tablets, repeated every three hours, if necessary

\*Long, C F, M D Edrisal in the Managemen of Dysmenorrhea, Indust Med 15 679 (Dec) 1946 Indust Nurs 5 23 (Dec) 1946

Yes, and experience is the best teacher in smoking too!

EXPERIENCE during the wartline shortage taught smokers the differences in cigarette quality. Millions of people smoked more different brands then than they would normally have tried in years. More smokers came to prefer Camels as a result of that ex

perience so that today more people are smoking Camels than ever before But, no matter how great the domand we don't tamper with Camel quality Only choice tobaccos, properly aged and blended in the time

honored Camelway are used in Camels.

According to a recent Nationwide survey:

More Doctors Smoke Camels

than any other cigarette

# MANDELAMINE

Reg. U S Pat. Off

(M thenamine Mandelate)

An increasing number of physicians are discovering that the treatment of common urinary infections with Mandelamine is as simple as A B-C. Three to four Mandelamine tablets administered orally three times daily, will promptly control urinary infection in a high percentage of patients. Disturbing urinary symptoms are usually alleviated rapidly and, in the absence of obstruction, the urine is promptly cleared of pathogenic organisms.

The uncomplicated oral administration of Man delamine requires no supplementary acidification (except in those cases where urea splitting organisms are present), restriction of fluid intake, dietary control or other special measures, and Mandelamine may be administered virtually without consideration of toxic effects—thus eliminating the necessity for careful selection of patients. A physician's sample and literature on request

Generating a pressure mounting as high as 3000 pounds per square inch, this Carnation homogenizer forces the milk through almost invisible apertures. The original large butterfat globules are pulverized to a size of 1 to 3 microns, and evenly dispersed throughout the milk. This renders the butterfat more readily assimilable and brings uniformity to the formula in which this good milk is used. Yet this is merely one of many scientifically controlled processes that contribute to the recognized value of Carnation Evaporated Milk for infant feeding and special dietary uses.

the With EVERY DOCTOR KNOWS

HEAT REFINED—forming fine soft flocculent low tension curds

HOMOGENIZED—with butterfat minutely subdivided for easy assimilation

FORTIFIED—containing pure crystalline vitamin D<sub>3</sub> 400 U.S.P. units per pint.

STANDARDIZED—for uniformity in fat and total solids content

STERILIZED—after hermetic sealing insuring bacteria free safety and markedly diminished allergenic properties.

### THE NEWEST ADDITION TO THE FAMILY

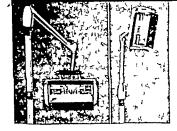

The G-E Prescription Model Ultraviolet Lamp offering you all the famous
G-E X-Ray quality and service in a new low cost ultraviolet lamp

This new economically, priced lamp features the famous G E Uviare high pressure mercury quarts burner—economical to operate and with emission characteristics covering the full range of therapeutic ultraviolet. Long familiar to users of G E professional type lamps, the Uviars burner emits intense uniform radiation throughout the spectral bands of proven clinical value

The compact, sturdily constructed burner housing is mounted on the Dazor Floating Arm. Fabulously flexible and almost human this remarkable arm with its fingertip control makes the positioning of the lamp amazingly swift and sumple. Raise lower swing the burner housing through an arc. it freezes in position wherever you stop it—and it stays there too until you move it again. Nothing to tighten, no time consuming adjustments. This revolutionary feature facilitates rapid positioning of the lamp and offers a wide selection of treatment distances.

Plan now 10 offer your patients the benefits of altraviolet the year cound with the G E Prescription Model Ultraviolet Lamp Clip and mail the contenient compon today to Dept 2667 General Electric  $\lambda$  Ray Corporation 175 West Jackson Bouleward Chrago 4 Illinois

in Oil and Wax

You get these advantages with Squibb's New Double-Cell Plastic Cartridges for B-D disposable or permanent syringes

- New Plastic Cartridges minimize breakage hazards
- Sterile Aspirating Test Solution guards against accidental intravenous injection
- Crystalline Penicillin G Sodium Squibb in Oil and Wax at room temperature requires no heating
- Improved lubrication of stoppers further decreases breakage—speeds injections

# CRYSTALLINE PENICILLIN G SODÍUM SOUIBB IN OIL AND WAX

NOW comes in the new *plastic* double-cell cartridge which minimizes breakage hazards

One cell of the double-cell cartridge contains 300,000 units of crystalline penicillin G sodium in refined peanut oil and 48% bleached beeswax (Romansky formula). The other cell contains Sterile Aspirating Test Solution. Therapeutic serum concentration levels are maintained for 24 hours with one or two imjections. In overwhelming infections, the dose may be doubled but the frequency need not be Ambulatory treatment is practical for many diseases formerly requiring hospitalization.

For real convenience in administering penicillin in the home, office or emergencies try Crystalline Penicillin G Sodium Squibb in Oil and Wax in the new *plastic* double-cell cartridge

# WHENEVER THE NUTRITIONAL STATE MUST BE IMPROVED

The food drink made by mixing Oval tine with milk finds frequent application whenever underpar nutrition is encountered. It is equally valuable whether the need for dietary supple mentation arises from the ravages of acute infectious disease from dietary limitations made necessary by surgery or from faulty food selection over a prolonged period.

This nutritional supplement is delicious in taste readily digested and thoroughly bland. It may be taken either hot or cold as the patient de sires and is appealing to both children and adults. It supplies a wealth of vir tually all essential nutrients including ascorbic acid and B complex and other vitamins. Its proteins are biologically complete a feature of importance in the correction of debility states. Three glassfuls of this delicious food drink daily round out even an average diet to full nutritional adequacy.

THE WANDER COMPANY 360 N MICHIGAN AVE CHICAGO I ILL

Three servings daily of Ovaltine each made of 1/2 oz. of Ovaltine and 8 oz. of whole milk,\* provide:

CALORIES	669	VITAMIN A	3000 1.0
PROTEIN	32.1 Cm.	VITAMIN BL	1.16 mg.
FAT	31 5 Gm.	RIBOFLAVIN	2.00 mg
CARBOHYDRATE	64.8 Gm.	HLACIN	6.8 mg.
CALCIUM	1.12 Gm.	VITAMIN C	30.0 mg
PHOSPHORUS	0.94 Gm.	VITAMIR D	417 LU
IRON	12 0 me	COPPER	0.50 mr.

\*Based on average reported values for milk.

The need for supplementary amounts of vitamins to maintain essential vitamin balance varies in accordance with the patient's dietary restrictions and habits and such contributing factors as pregnancy, wasting diseases, and the anemias Prophylaxis is assured by optimal quantities of each of the six water and fat-soluble vitamins contained in one Gelseal 'Multice-

brin' (Pan-Vitamins, Lilly) In addition, each Gelseal 'Multicebrin' contains significant amounts of two other important factors, considered to be essential to health, for which optimal requirements have not been definitely established Two to five Gelseals 'Multicebrin' daily are indicated when multiple vitamins in particularly high potency are desired

Lilly

Supplied in packages of 100 and 1,000

### What Your Taxes Buy in Washington

II

### Federal Health Workshops1

In a previous issue we discussed the propaganda device of the "Federal health workshops," sponsored by some six agencies of government for the purpose of creating an artificial, federally stimulated public demand upon Congress for enactment of compulsory health insurance <sup>2</sup>

Many doctors of medicine have had the uneasy feeling that some Federal departments, bureaus, and agencies were exceeding their proper functions, not openly perhaps, but in some way effectively, in forwarding such propaganda.

The device of the "health workshops" has not been disclosed previously, at least to our knowledge According to statistics from the report of the Committee on Expenditures in the Executive Departments, page 2, based on the latest figures from the Budget Bureau, "An increase of approximately 300 per cent in Federal expenditures for publicity and propaganda in a period of five years (1941 to

 This is the second in a series of editorials on this subject.
 House Report No 786 80th Congress, 1st Seeston, July 2 1947

1946) is deemed by your committee to be a proper subject for inquiry by the Congress." In that time expenditures for these purposes had increased from \$27,770,000, to \$75,000,-Was all of this increase in support of the legitimate activities of the departments bureaus, and agencies? Was the national program of "health workshops" launched by the Public Health Service under the "extraordinary executive pressure exerted upon to further the campaign for what certain witnesses and authors of propaganda referred to as socialized medicine a legitimate project for the U.S.P.H. in 1946? The Committee on Expenditures in the Executive Departments does not seem inclined to view it that way

Testimony before the committee indicates also that the staff and resources of the Bureau of Research Statistics in the Social Security Board were devoted freely, from time to time, to the preparation of pamphlets and propagands literature for the C.I.O the A.F.L., and the Physicians Forum.

the Social Security Board at Government expense, supported what certain witnesses and authors of propaganda refer to as socialized medicine in every approach and dismissed contemptuously all arguments controverting the fixed position of the Social Security Board (hearing, p. 170)

Your committee concludes from the testimony that most, if not all, of this literature, as distributed by the CIO, the AFL, the Farmers' Union, and the Physicians' Forum origmates in, and emanates from, the Bureau of Research and Statistics in the Social Security Roard

Mr Isadore Falk is director of the Division of Research and Statistics in the Social Security His principal assistant, Miss Margaret Klem, was a witness before your committee on Miss Klem was identified as chief of June 18 the Medical Economics Section of Mr Falk's She was one of the group of Federal Division employees who charted, arranged, and conducted the Jamestown Health Workshop testimony discloses also that she helped draft the Wagner-Murray-Dingell bill

Other evidence before the committee reveals that the Bureau of Research and Statistics of the Social Security Board also prepared pamphlets and propaganda material to be distributed under the imprint of the CIO Similar pamphlets were prepared in the same office for distribution as Government literature through the Department of Agriculture's Interbureau Committee on Postwar Programs All this matemal, as presented in our hearings, is similar in tone, content, and objective It all originates in one spot, in the Social Security Board It is all paid for, save the actual printing, by a process which your committee deems an improper use of Federal appropriations

Samples of all these pamphlets and propaganda leaflets are available in your committee's Photostatic copies of some of them have been transmitted to the Attorney General, with our request for action in defense of the American taxpayers, who are paying the bill

Little by little the linkages, the subterfuges, diversion of public funds for previously undisclosed propaganda purposes by agencies of government begin to show up The contention of many individual physicians, also their county, state, and national organizations, that persons within the government were utilizing these quite respectable departments, bureaus, and agencies to promote and foster a demand for socialized medicine which does not actually exist in the United States, seems to be justified shall have more to say on this subject

# Utopia

In a paper entitled, "Psychiatric Sense and Nonsense," Di C C Burlingame makes some interesting observations that deserve to be aired in even wider fields than those of psychiatry \*

A patient can be taken into a psychiatric institution and his psychiatric disorder can be alleviated by protecting him from the sin and suffering in the outside world and applying any one or several of other psychiatric treatments

I urge a period of self-analysis to see if the procedures used have not in a large measure been a desocialising influence For example. how many patients have been making baskets, weaving rugs, and polishing the floors in the hospital? How many of these same patients will make baskets, weave rugs, or polish floors in their communities if the psychiatrist succeeds in sending them home?

A psychiatrist must first of all be a good phy-

sician with a complete knowledge of the human body, and must use his knowledge in treating his Second, he must be a bit of a sociologist who is a constant student of the milieu in which his patient has lived and must live in the Third, he must be a psychologist who future understands the workings of the human mind Fourth, he must be a specialised type of educator, and fifth, he must be a vocational guidance ex-

It seems to us that Dr Burlingame has written a creditable description of a doctor His standards are difficult and exacting They presuppose that the education of such a man goes on all his life We can' hear many so-called "educated men" muttering "Have I got to go on studying all my life?" The answer is "Yes"—but not necessarily from textbooks And no doctor, we hope, ever undertook the practice of medicine in anticipation of an easy life

<sup>\*</sup> Burlingame C C J.A M.A 33 971 (April 5) 1947

Suppose we apply Dr Burlingame's principles to the field of industrial medicine, and, more specifically, to the problem of the injured working man. Everyone concerned in the problem—the patient, his doctor, the employer, the company doctor—is at fault in one way or another. The remarks that follow are not intended in the spirit of carping criticism, nor are they meant to wound any one's feelings. If they happen to do so, it will probably be because the cap fits.

Once the patient has adjusted himself to his invalidism and his reduced but certain income, he, at least subconsciously, may begin to think about how long he can stay sick. This is a danger inherent in workmen's compensation. One of man's greatest desires is for security, and once he gets it, he sometimes doesn't want to work. This is a fact evidently not very well understood by the leaders of Britain's Socialist party, with their slogan of "Security from the Womb to the Tomb"

The doctor, too, has a direct interest in prolonging the patient's convolescence would be interesting to speculate on how much harm has been done to the morale of all parties concerned by the invention of the diathermy machine It also enables the doctor to keep his patients under frequent supervision Surely this is desirable attending surgeon in a well run hospital service sees his patients every day, whether they need it or not In so-called "teaching institutions" the doctor likes to have his wards well-filled with fracture cases for the edification of his students. This has been largely responsible for the popularity of the treatment of fractures by traction and suspension

Employers also are at fault, though un derstandably so, because, with few exceptions, they will not take a man back to work until he declares himself capable of full duty on the job he held previously

Insurance companies, although with another goal in mind, too are at fault, for they try to hasten unduly the patient's convolescence. This leads to frequent and sharp differences of opinion between the patient's and the company's doctor. Ask any long-suffering "referee," or any "impartial specialist"

We can hear many of our readers breath-

ing heavily and muttering "What kind of a Utopia is this fool thinking about?" Well they have a right to know Criticism that offers no solution is fittle and permisons

First, we should like to be allowed to operate in a small industrial community Our experiment would be modeled along the lines of the Metropolitan Life Insurance Company's Framingham Experiment we could find it, we should choose one where relations between employers and employees were reasonably cordial Just think, if you can, of a town peopled by men of good We should have a mass meeting at which we should endeavor to explain the great but apparently incomprehensible doctrine that Labor is a mutual affair workman cannot work unless he has a factor, to work in, and a factory without workmen is a useless and expensive burden to its If it does not produce, the govern ment loses heavily on taxes And where will social security be then?

To return to the problem of the injured working man, the accident should not have occurred in the first place An accident is a black mark against all concerned. Once it has happened it is to the main interest of everyone concerned to restore the patient to working capacity as soon as possible are going to disregard the Simon Legrees of capital and the malingerers of labor are going to proceed upon a most unusual assumption-that both employer and em ployee have a little common sense ity, generally, is understood to be the greatest misfortune that can befall a man fore, the employer, backed by the insurance company, will procure the best possible medical and surgical attention tient will have his free choice of doctor, but every doctor in the community will know his business We mentioned Utopia once before didn't we?

As soon as it is humanly possible the patient will be returned to some kind of work Perhaps Dr Burlingame might allow the patient to engage in a little floor polishing for then he would have no chance for thinking of himself as an invalid. If he were in a hospital he would be among similarly injured men whom he knows. He would not be allowed to lie at home in lonely isolation, thinking of himself as the solitary victum of

misfortune He would not feel that the company doctor was trying to rook him of his just deserts

If it is clear that he will never be able to return to his original job, he would be taught another one If you don't believe us, we refer you to the Institute for Crippled and Disabled, 23rd Street and First Avenue, New York City

When he returns to work—any work—he will feel that he has been very well looked

after, and will feel kindly—no, we didn't say grateful—toward his employer. His boss will be glad to get him back so unexpectedly soon. The doctor will be pleased with the job he has done and the fee he has been paid, and the insurance company will have saved money.

Best of all, that community will have little call for the services of Dr Burlingame and his psychiatric colleagues

Utopia, it's wonderful!

### Current Editorial Comment

The Status of Abortus Infections in the United States Brucellosis masquerades under so many forms, invades so many tissues of the body, and is so protean in character, that the disease generally escapes diagnosis This is partly due to the fact that most cases in this country are Brucella abortus, attenuated to such a degree that the disease has lost its clinical identity

It is natural that the abortus variety should atta ingreater and more rapid attenuation than the suis or melitensis types, because of our almost universal use of milk and milk products in which the abortus organisms live. The extensive traffic in cattle and dairy products contributes to the spread and attenuation of the organism, and has made the clinical and laboratory diagnosis more difficult.

In his interesting article on abortus infections, presented at the Inter-American Congress for the Study of Brucellosis, in Mex-100 City last year, H J Schmidt gives some pertinent figures It is estimated that 6 to 10 per cent of all cattle excrete the organism, that 50 per cent of all milk-producing animals in the South are in herds infected with Brucella abortus, that 38 per cent of all dairy herds in the United States are infected, and that in 1911, 14 per cent of all market milk contained Brucella abortus acute brucellosis has probably declined, it is estimated that about 10 per cent of the population of the United States has become infected and that, at any given time, 1 per cent of those infected are ill with brucellosis

The same changes toward chronic infection, with attenuation of the organism as

observed in man, have taken place also in cattle. In recent years there has been a marked diminution in the incidence of abortion and dead fetuses among cows. In a southern rural region a survey showed 20 per cent of the cattle reacted positively for Bang's disease and, in some dairy herds, the incidence has been as high as 60 per cent. Only the finest stock were the reactors, the poorer diseased cattle showing no anti-bodies

This change to reduced virulence of Brucella abortus conforms with the basic principles of immunology, in this respect closely resembling the organism of syphilis Stokes says "While it has been shown that agglutinins and lysins for the spirochaeta pallida are found, the amounts are insignificant so far as inhibitive effect on the disease is concerned" The diagnosis of chronic brucellosis is as difficult as would be the diagnosis of syphilis without the aid of the Wassermann reaction Brucellosis syphilis are similar in protein manifestations, loss of clinical identity, their chronic course, loss of affinity for certain tissues, and in pathology, involving practically all tissues

The attenuation of the Brucella abortus has made the agglutination test of little value, the intradermal test does not distinguish past from active infection, the opsonophagocytic index is of questionable value, and culture work in diagnosis is limited by the difficulties of growing Brucella abortus. The procedure best adapted for diagnosis of chronic brucellosis would appear to be the complement fixation test, but more work will be required to establish definitely its reliability.

# SURVEY OF RAGWEED POLLINATION IN THE NEW YORK METROPOLITAN DISTRICT IN 1946\*

EUGENE H WALZER, M.D. JEROME SHERMAN M.D. ROBERT A. CHAIT, M.D. and MATTHEW WALZER, M.D. Brooklyn. New York

(From the Division of Allergy Jewish Hospital of Brooklyn)

POLLEN counts taken in Central Park, Man hattan, and spot checks in other parts of New York City have previously been reported by Durham.<sup>1-7</sup> Pollen counts also have been made at the Jewish Hospital of Brooklyn for a number of years. An extensive pollen survey of the entire New York Metropolitan District has not been attempted previously. The recent adoption of standard technics for exposing and counting pollen slides by the Pollen Survey Committee of the American Academy of Allergy<sup>3</sup> has made such a survey possible for the first time.

The present study was undertaken for the following reasons (1) to determine the relative rangweed pollen concentrations in the various boroughs (2) to determine whether the pollen counts of Brooklyn and Manhattan, the only boroughs studied in the past, have been representative of the entire city, (3) to determine to what extent ragweed pollination in surrounding communities influences New York's pollen problem, (4) to collect data which might help to determine the effectiveness of the ragweed extermination campaign which is being carried on by the Department of Health in this city (5) to obtain further data on the relationship of meteorologic conditions to pollen counts

#### Technic

The technics employed in preparing, exposing, staining, and counting pollen slides in this survey were those recommended by the Pollen Survey Committee of the American Academy of Allergy The device designed by Durham was employed for exposing all slides. "Essentially it consists of two 9-inch heavy polished stainless steel disks set horizontally 3 inches apart and held with three struts. One inch above the center of the lower plane is a slide holder into which the slide fits snugly. The supporting rod of the

apparatus, 30 inches long rises from a tripod base equipped with holes so that it may be screwed to a solid platform. <sup>18</sup> Comparative studies were made with this slide shelter and an old shelter which has been in use at the Jewish Hospital in Brooklyn for the past eleven years. The latter consists of a flat wooden base measuring 8 by 8 inches and covered by a semicurcular metal roof 4 inches high in the center completely open at both ends, and partially open on the sides. The exposed slide was set in the center of the

base and held in place by two flat clips

Glass slides, frosted at one end were exposed daily at 9 00 A.M for twenty four hours. had been rubbed with a drop of a mixture con taining 75 per cent U.S.P petrolatum and 25 per cent U.S.P mineral oil The film was made as thin and as smooth as possible prevent contamination, all slides were stored in tightly covered slide-boxes at all times, except when exposed in the shelters or being counted To facilitate identification of the pollen granules, two or three drops of Calberia's staint were dropped on the exposed slide. This stained the pollen grains a deep reddish-purple. A cover alip 2.2 centimeters square was then placed on the slide. All the grains under the cover shp (4.84 sq cm.) were counted under the low-power objective of a microscope equipped with a mechanical stage. When there was difficulty in identifying pollen grains under low power, the high, dry objective was employed. By dividing the number of pollon grains under the cover slip by 4.84, the number of granules per square con timeter of slide could be computed. All figures in this report represent the number of ragueed granules per square centimeter of slide during a twenty four hour exposure To convert these figures to pollen grains per cubic yard of air, the count per square centimeter should be multiplied by 36. This factor applies only to counts for

Presented at the Semiannual Meeting of the Association of Allergy Clinics of Greater New York, November 12 1916.

<sup>\*</sup> This survey was made in collaboration with the Pollen Survey Committee of the American Academy of Allersy

<sup>†</sup> Calberia e solution: S co. of giveerin 10 ce. of 95 per cent alcohot 13 cc of distilled water; 2 drops of saturated aqueous olution of fuchsin.

pollen collected on slides exposed in the Durham shelter under standard conditions

A total of 850 slides were counted by two observers. The margin of personal error was reduced to a minimum by repeated checks on the same slides by both observers.

### Location of Exposure Stations

The areas, where exposure stations were set up, were arbitrarily divided into three zones (1) The inner zone consisted of the five boroughs of New York City, (2) The middle zone consisted of four localities within a 50-mile radius of New York City Included were Hewlitt and Mineola on Long Island, Verona in New Jersey, and Croton-on-Hudson in New York State (3) The outer zone consisted of two cities outside of the 50-mile zone, New Haven and Waterbury, Connecticut In addition, for purposes of comparison, counts by workers employing the standard technic were obtained from Philadelphia, Pennsylvania, Washington, D C, and Cleveland, Ohio

Exposures were made on the roof tops of buildings located as closely as possible to the geographic center of the community to be studied. The selected buildings were usually the tallest in the vicinity and were not flanked by nearby structures. The Durham shelter was always placed at least three feet above any nearby parapet or other obstruction.

The sites selected for exposure of the slides were as follows

Inner Zone — Brooklyn Jewish Hospital, Manhattan Belvedere Tower in Central Park, the Bronx Montefiore Hospital, Staten Island Sea View Hospital, Queens Rockaway Park, Rockaway Beach Hospital, Flushing the Chamber of Commerce Building, Ozone Park the Police Department Building

Middle /one—Long Island Hewlett, Fire Station Building, Vineola, Nassau Hospital, Verona, New Jersey, a five-story apartment building, Croton-on-Hudson, New York, a three-story high-school building

Outer Zone —Connecticut New Haven, Grace Hospital, Waterbury, Waterbury, Hospital

Several factors influenced the choice of localities for exposing slides. Some communities, such as Hewlett, on Long Island, and Rockaway Park, in Queens, were selected because hay-fever symptoms of patients, who lived in those areas, had, in previous years, been more severe than those of patients from other parts of the Mictropolitan district. Information on ragweed pollination in these places was, therefore, of clinical importance. Ozone Park in Queens was selected because it represented roughly the center of the land-mass occupied by Brooklyn and Queens, Mineola was chosen as a representative area for Nassau County. A station was set up at Croton-on-Hudson, New York, at the request of

the township, which was interested in a local pollen count. The following communities were selected because rehable workers, who were familiar with the technic recommended by the American Academy of Allergy, were available in these localities. Flushing, Queens, Verona, New Jersey Waterbury and New Haven, Connecticut, Philadelphia, Pennsylvania, Washington, D.C., and Cleveland, Ohio

Hospital roof tops were selected in Brooklyn, Manhattan, Staten Island, and the Bronx because of their height, and because reliable personnel were available at these institutions to change the slides daily

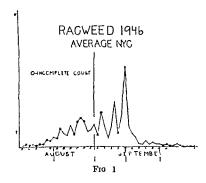

In most instances, stations were set up for the entire ragweed season, but, in a few places, such as Rockaway Park, Ozone Park, Hewlett, and Mineola counts were made for shorter periods of time.

The slides from all of the stations in the inner and middle zones, and from the two Connecticut stations in the outer zone were counted by the authors For counts in Washington and Cleveland, the writers are indebted to Drs E Kailin and H J Friedman, respectively These workers had carried on pollen studies in this laboratory, in previous years, and were familiar with the standard technic For the Philadelphia counts the writers wish to thank Dr G Blumstein, who also employed the standard technic

The old shelter was nailed to a parapet on the roof of the Jewish Hospital of Brooklyn, in the same position it had occupied in previous years. Counts were continued with this shelter as well as with the new standard instrument, so that comparative equivalents of the two technics could be obtained. The Durham shelter was placed alongside of the old shelter so that the exposure conditions for both instruments would be the same.

### Results

The results of the survey for each locality are presented in the graphs 'The daily figures noted in the charts represent the number of ragweed pollen granules per square centimeter of slide exposed for a twenty-four-hour period Circles represent days on which the pollen counts were incomplete because rain had partially washed The number of pollen granules out the slides lost from the slide on such days varied with the amount, force, and direction of the rain those few days when the exposed slide either was broken accidentally or completely washed out by heavy rainfall, the count was estimated and represented on the chart by a small square estimates were obtained by averaging the counts in the surrounding area. This procedure was adopted in order to minimize the statistical error which would result if such counts were omitted entirely or counted as zero In Figs 2 to 10, inclusive, the average counts for New York City are presented for comparison with those of the other localities studied

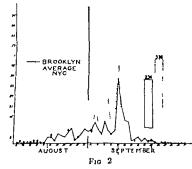

The blocks on the charts represent seasonal totals for each community obtained by adding the daily counts at that station. These are compared with the average totals for New York City, computed from counts taken on the same days.

#### Inner Lone

Average Pollen Counts in New York City The counts for all of the boroughs were aver aged every day, and the figure thus obtained was considered the average daily pollen count for New York City In Fig 1 the average daily counts for New York City are recorded for the entire season in terms of the number of pollen grains per square centimeter of slide. The first traces of ragweed pollen appeared in New York City on August 11 The pollen counts for Greater New York were minimal until August 23, when a count of 10 was obtained There was a gradual rise in pollen concentration until Au gust 28, when a count of 17 the highest for that month was reported In September counts of 20 and 26 obtained on September 3 and 7, respectively, were the high points during the first mne days of the month On September 10 a count of 46 represented the peak of the season On September 12 the count dropped to 8 and for the remainder of the season there were only traces of ragweed pollen in the air

Brooklyn The pollen counts in Brooklyn were the lowest obtained in any of the boroughs (Fig 2) The first traces of ragweed pollen appeared in Brooklyn on August 11 and throughout all of August the daily counts of 12 and 13 were obtained A count of 39, on September 10 was the highest obtained in Brooklyn for the season the average count for the city on this date was 46 Thereafter the count dropped

precipitously and was minimal for the remainder of the season. The total seasonal pollen count for Brooklyn (230) was approximately two thirds that of the average for New York City (338)

Queens Two stations were set up in Queens one for the entire sonson in Flushing the other, a roving station in Rockaway Park from August 13 to 27 inclusive and in Ozone Park, from September 4 to 23 inclusive

(a) Flushing Pollen counts in Flushing throughout most of the season were below the average for New York City (Fig. 3) From August 11 to August 22 there were only traces of pollen on the slides Thereafter, there was a slight increase in pollen concentration until August 30 when a count of 10 the highest for the month was reported A count of 27 on September 3 was the highest peak of the season for this station. It was unfortunate that on September 10 when the average count for New York City was 40 the slide in Flushing was completely washed out by a local rainstorm.

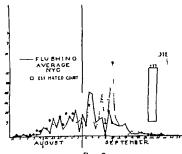

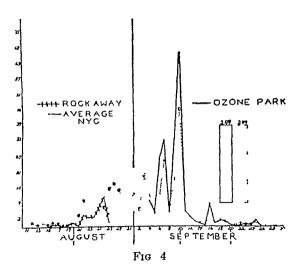

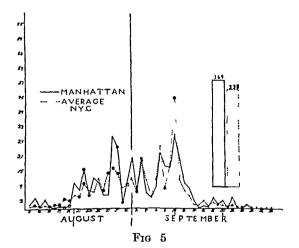

Fig. 3

The total seasonal pollen count in Flushing (227) was slightly below that of the average pollen count in New York City (338)

(b) Rockaway and Ozone Park For the twelve days during which the roving station remained in Rockaway Park, the counts were slightly lower than the average for New York City (Fig 4) During the time the station was located in Ozone Park, there were two peaks 29 on September 7, and 68, the peak for the season, on September 10 Totals for the season for comparative days of exposure were equal for Rockaway-Ozone Park and New York City

Manhattan This station was set up at Belvedere Tower in Central Park, on August 11, 1946 There was a count of 16 on August 22, the highest until August 28, when the ragweed count was 29 (Fig 5). During the first week of September, the pollen concentration remained high, with counts of 21 on September 1 and 3, and a count of 23 on September 7 The peak for September occurred on the tenth, when a count of

BRONX
AVERAGE
NYC

AVERAGE
NYC

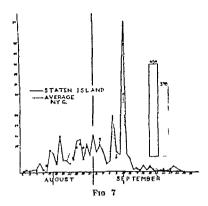

SEPTEMBER

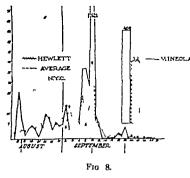

FIG 6

30 was recorded Thereafter, the pollen concentration diminished rapidly, and, by September 18, the count was very low The seasonal total for Manhattan (369) was approximately the same as that for the entire city (338) Moreover, during most of the season, Manhattan was the borough which most closely followed the average daily count for Greater New York

Bronx The pollen shelter was placed at the Montefiore Hospital on August 11 len counts for the Bronx during most of the season were found to be above the average for New York City (Fig 6) During the period from August 11 to 21, there were only traces of ragweed pollen in the air, but on August 22 the count rose to 15 Thereafter, throughout August, there was a steady increase with peaks of 35 and 46 on August 25 and 27, respectively The count fell somewhat during the last four days of August, but there was a rise in September with peaks of 22, 48, and 41 on September 3, 7, and 10, respectively The peak for the season occurred on September 7 On September 10, the estimated count for the Bronx was slightly lower than that of the average for New York City The seasonal total for the Bronx (394) was slightly above those for the average of the five boroughs (338)

Staten Island Pollen counts for Staten Island were higher than those for the average of New York City for the season (Fig 7) The first significant pollen spill in Staten Island occurred on August 19, when the count was 13 August, the highest counts obtained were 21 and 19 for the 22 and 28, respectively During the first week of September there were two significant counts 21 on the first, and 33 on the The peak for the season, a count of 88, seventh was recorded on September 10, when New York had its peak of 46 After September 10, the

counts in Staten Island were low The total for the season in Staten Island (454) was greater than the average for New York City (338)

#### Muddle Zone

Hewlett and Mineola Exposures were begun in Hewlett on August 18, 1946 On August 19 this station had a count of 27 a pollen spill not found in New York City (Fig 8) Thereafter, and until September 3, the counts paralleled those of New York City and were below 20 The shelter was then moved to Mincola exposures were made there from September 6 to September 29 In Mineola the counts were higher than those for the average of New York On September 7, a count of 42 was obtained. This concentration was maintained until September 10 when there was a great spill and the count at Mineola rose sharply to 162 was the highest count obtained in our survey of the Inner and Middle Zones The drop thereafter was precipitous and the pollen count here, as in New York City, was negligible for the remainder of the season Comparative totals over the same period of time showed Hewlett and Mineola (469) to have an appreciably higher pollen concentration than the average for the five boroughs (312)

Croton-on Hudson Pollen studies were begun in Croton on August 14 The first appreciable pollen spill occurred on August 20, when a count of 40 was obtained (Fig 9) A lower peak of 33 was recorded on September 1 Neither of these peaks was noted in the New York City counts. The peak of 50 on September 10 approximates that which occurred in New York City on the same day The count thereafter was minimal. The total seasonal count in Croton (326) was

approximately the same as that of the average for New York City (335) during the corresponding peniod of time.

Vorona, New Jersey Pollen studies were begun in Verona on August 29 The counts roughly paralleled those of the average for New York City until September 8 (Fig. 10) On September 9, Verona had a peak of 30, while the peak of 46 in New York City occurred on the following day Although the counts in New York City thereafter were negligible, a count of 15 was obtained in Verona, on September 19, and another of 29 on September 23

The latter rise was due to a local storm with a wind of high velocity. The total seasonal count in Verona (262) was slightly higher than that of the average for New York City (242) over a comparative period of time.

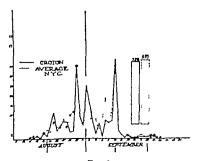

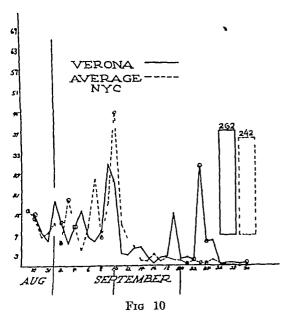

Fig 9

### Outer Zone

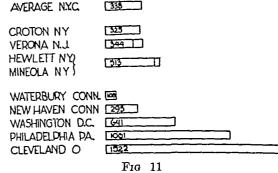

In Waterbury, Connecticut, the total pollen count of 108 for the season was extremely low (Fig 11) In New Haven, Connecticut, the total count of 295 was lower than that of the average for New York City In Washington, DC, the count of 641 was roughly twice that for New York In Philadelphia, Pennsylvania, the seasonal total of 1,061 was approximately three times that of the average for New York In Clevel ind, Ohio, the total count of 1,522 was four and one-half times the average for New York City

# Comparison of Ragweed Counts for the Seasons of 1946 and 1945

The Durham shelter has been in use during the past two years Ragweed pollen counts were made with this shelter in Brooklyn, Manhattan, and Philadelphia for part of the 1945 season and for 1946

Brooklyn counts suitable for comparison were available for the same twenty-one days in both seasons. In Brooklyn, it was found that the total twenty-one-day pollen count in 1946 was 70 per cent of that obtained in 1945 (Fig. 12). In Philadelphia comparative studies for the entire two seasons showed the 1946 ragweed pollen count to be 68 per cent of that obtained in 1945.

In Manhattan the site of exposure used in 1945 was found to be unsatisfactory In 1946 it was moved to a more suitable location A comparison of pollen counts for the same twenty-three days in the two years revealed the 1946 ragweed pollen count to be 88 per cent of that

recorded in 1945 This percentage is at variance with the percentages for Brooklyn and Philadelphia The discrepancy is probably due to the inadequacies of the 1945 exposure site

### Counts Obtained with Old Shelter in Brooklyn in 1946

In 1945 and 1946 the Durham shelter was placed adjacent to the old shelter on the roof of the Jewish Hospital of Brooklyn, in order that the slide exposure would be the same for both instruments. The total pollen count (886) obtained with the old shelter in 1946 was 48 per cent of the average seasonal count (1,827) recorded for that instrument from 1936 to 1946, inclusive (Fig. 13)

#### Discussion

In the Inner Zone the pollen counts in Brooklyn and Flushing were lower than the computed average for all five boroughs Counts in Manhattan and Rockaway-Ozone Park approximated the five-borough average, and counts in Staten Island and the Bronx were above the average for the five boroughs

In the Middle Zone counts for Croton and Verona were approximately equal to those of the average for the five boroughs, whereas pollen counts in Hewlett and Mineola were above those of the city. In the Outer Zone Connecticut pollen counts were lower than those in New York, but counts obtained in Philadelphia, Washington, and Cleveland were all higher than those of the Metropolitan area.

Of the five boroughs, the pollen curve for Manhattan most closely approximates that of the average for the city Brooklyn counts were lower than those of the city as a whole Whether these relationships will continue to apply in future years, when the pollen seasons are more normal, remains to be determined

It is apparent that the ragweed pollen crop in New York City was light in 1946 This scarcity of pollen was noted also in other parts of the eastern United States Counts in Veiona, New

#### RATTO 1946-45 WITH DURHAM SHELTER

BROOKIN REJORANT CAN FOR TO TOX HANNER PROMITE 1 - 1 1.7 88% 68% PHEADELPHA READON' TO Some

Jersey, Croton, New York, Waterbury and New Haven, Connecticut, were either of the same order or lower than those in New York City In Brooklyn and Philadelphia, where the same technics were employed during 1945 and 1946, the pollen counts for the 1946 season were lower than those obtained in 1945. The percentage relationship of the counts for 1946 and 1945 in Brooklyn (70 per cent) and Philadelphia (68 per cent) closely approximate each other should be pointed out that of all the localities studied New York City was the only community in which a ragweed extermination campaign was in progress in 1946

Although the seasonal total for 1946 in Brooklyn with the old shelter was only 45 per cent of the average obtained during the past eleven vears, this is not the lowest seasonal total rag weed pollen count recorded at the Jewish Hospital In 1937 a scasonal total of only 702 was obtained

The 1946 ragweed pollen season was not only light but its onset was delayed about ten days. In Brooklyn two peaks usually occur each year one during the last week in August, and another during the first week in September In Brooklyn, during August, 1946 ragweed pollination was n gligible It was not until September 10 that an appreciable pollen count was recorded Manhattan the Bronx, and Staten Island counts did rise during the last week of August, but at almost every station including those from the middle and outer zones, the highest counts for the reason did not occur until September 10

It is quite possible that the commendable efforts of the New York City Department of Health in the ragweed extermination campaign may have had some influence in lowering the pollen counts in 1946 Because this campaign was carried on in a year when ragweed pollenation was light, its value cannot be estimated. It is quite possible that a continued intensive campaign in New York City as well as in the surrounding communities may affect the local pollen counts. Until surveys are made for several years, it will not be possible to estimate the effectiveness of the regweed elimination campaign.

The poor ragweed pollen crop in the middle Atlantic States in 1946 may in part be explained by meteorologic conditions Mr. Fred Hodgson

botanist, in Verona New Jersey stated that 1946 was a poor season for pollen collection not only for ragweed, but also for trees and grasses He attributed this paucity of pollen to lack of sunshine An examination of weather data shows a diminution in sunslane during May and June when the total sunshine recorded was 15 per cent below the average possible sunshine for those two months There was an excess of rain in May and June, \$1 per cent above average for May and 44 per cent above average for June The meteorologic conditions in July 1946 were average in all respects but August was an ususual month The sunshine in August was 13 per cent below average The mean temperature in August was 2.5 F below the normal On twenty one of the thirty-one days, or 65 per cent of the month, the temperature was below normal During August, the wind velocity was below average on eighteen of thirty-one days or 60 per cent of the time The rainfall in August was 0.81 inch below normal or 18 per cent below the usual precipitation. Although the amount of sunshine in September was greater than usual it was below the average for ten of the first fifteen days, or 66 per cent of that time The temperature was average for 60 per cent of the time for the first fifteen days During the period from September 1 to 15, the wind velocity was below average for 80 per cent of the time

Thus in May and June when the ragweed was developing there was excessive run and a diminished amount of sunshine In August and during the first two weeks in September, when the plants should have been reaching maturity and releasing their pollen there were less than normal amounts of sunshine rain, temperature and wind This may very well account for the light, late crop in 1916

#### Summary

A pollen survey of New York City and its Metropolitan area was undertaken employing the standard technic outlined by the Pollen Survey Committee of the American Academy of Allergy

2 The pollen counts in New York City were low in 1946 Seasonal totals for the boroughs in

the order of increasing pollen density were Brooklyn, Flushing (Queens), Manhattan, Rockaway-Ozone Park (Queens), Bronx, and Staten Island

3 Pollen counts in Manhattan were most representative of the city as a whole

- 4 Seasonal ragweed pollen totals in Croton, New York, and Verona, New Jersey, were approximately equal to those of New York City Counts at two stations in Connecticut were lower than those of the New York Metropolitan area Counts in Hewlett-Mineola, Washington, D C, Philadelphia, Pennsylvania, and Cleveland, Ohio, were higher than those for New York City
- 5 The peak for the season, at most stations, occurred on or about September 10 The ragweed pollen crop in 1946 was late in maturing and was relatively light
- 6 The explanation for the scant pollen crop is probably to be found in meteorologic conditions which, from May through September, 1946, were unfavorable to the growth and development of ragweed plants

7 The data available at present is insufficient to evaluate the effect of the city ragweed extermination campaign

### PRIZE ESSAYS

The Merrit H Cash Prize and the Lucien Howe Prize will be open for competition at the next Annual Meeting of the Medical Society of the State of New York, May 17, 1948, in New York City

The Lucien Howe Prize of \$100 will be presented for the best original contribution on some branch of surgery, preferably opthalmology. The author need not be a member of the Medical Society of the State of New York.

The Merrit H Cash Prize of \$100 will be given to the author of the best original essay on some medical or surgical subject. Competition is limited to the members of the Medical Society of the State of New York, who at the time of the competition are residents of New York State.

The following conditions must be observed Essays shall be typewritten or printed with the name of the Prize for which the essay is submitted, and the only means of identification of the author shall be a motto or other device. The essay shall be accompanied by a sealed envelope having on the outside the same motto or device and containing the name and address of the writer.

If the Committee considers that no essay or contribution is worthy of a prize, it will not be awarded

Any essay that may win the prize automatically becomes the property of the Medical Society of the State of New York "to be published as it may direct"

All essays must be presented not later than February 1, 1948, and sent to the Chairman of the Committee on Prize Essays of the Medical Society of the State of New York, 292 Madison Avenue, New York.

Chas Gordon Heyd, M.D., Chairman Committee on Prize Essays

### COMMON SENSE IN INFANT FEEDING AND THE USE OF VITAMINS

A CLEMENT SILVERMAN, M D Syracuse New York

(From the Department of Pediatrics Syracuse University College of Medicine)

IT HAS been well said recently that "the foundation of the physical fitness of a people is embedded in the feeding and care of the nation's infants" In adhering to the title assigned me it is obviously necessary to emphasize the common-sense aspect of infant feeding Since it is generally agreed that the milk of a healthy mother is the most nearly perfect food for the infant, common sense would indicate that ma ternal nursing is the most natural method of infant feeding

Though in the last two decades artificial feeding has become simplified and has been remarkably successful, there is great need to encourage breast feeding among prospective mothers After thirty years of pediatric practice I have the distinct feeling that many of the difficult feeding problems of the first month or two of life would be avoided if the start were made with breast feeding

Since the fall of 1943 the Nutrition Foundation has launched a re-investigation of human milk and a comparison with cow's milk. The analyses were made by the Research Laboratory of the Children's Fund of Michigan and the study generally was made with the cooperation of the obstetne and pediatric departments of the Ford Hospital in Detroit, while the comparative values for cow's milk were carried out at Cornell The September, 1945 issue of the American Journal of Diseases of Children's devoted to some of these newer human milk studies

In consecutive observations of 900 women, it was found that six out of seven who attempt nursing will have an adequate supply by the fifth postpartum day, and only one out of seven will show a deficiency of lactation. The chances for full breast nursing were found to be from 65 to 74 per cent. In no instance was it necessary to take a baby off the breast because the milk did not agree with it. Nevertheless, breast feeding in Detroit hospitals was found to range from 5 6 to 69 per cent. Such a variation cannot represent physiologic differences but must be purely artificial

With respect to babies who were never put to the breast the most important single factor was refusal on the part of the mother to attempt nurang, this accounting for 40 per cent. Many mothers held the view that bottle feeding was as good, or even superior, to breast feeding Some had fear of gaining weight, or that the breasts would change their shape, or become pendulous. Others were afraid that it would interfere with home, business, or social duties

It is generally recognized that there are certain contraindications to maternal nursing. These may be listed as (1) acute illness, (2) mastitis, (3) cracked or fissured nipples or painful breasts, (4) pregnancy, (5) Rh plus infant of an Rh negative mother (6) allergy to mother's milk, (7) milk supply less than one third of the calone requirements.

It is obvious that if breast feeding is to be en couraged a good deal of the encouragement will have to be done by the obstetrician. His relationship to his patient is such that he can exert a tremendous influence in this direction. The quality of the milk depends upon the diet, and the obstetrician's prenatal advice surely includes a suitable dietary regimen. He can point out that her physical obligation to the child, begun at the onset of pregnancy, should carry through the lactation period, and he can prepare her for it.

But even before the obstetrician comes upon the scene, perhaps in the latter part of high school it could be emphasized that nursing is a basic mammalian pattern and that through the ages it has been natural for a mother to nurse her child Maternal nursing supplies physiologic and emotional stimulation and fulfillment. It makes for a stronger bond between mother and child and there is likely to be a sense of loss if the mother does not nurse her child. The newborn on his part has the same organic needs as other young mammals he needs close tactual contact, cud dling nuzzling mothering and the opportunity to suckle and use his lips Breast feeding thus, should be a satisfying experience for both Under normal conditions mother and child there is no known disadvantage.

Even after the baby is born the pediatrician often finds it possible to persuade the mother to maternal nursing, though she had not intended and had not been prepared to nurse. Emphasis must be put upon the dynamic process of maternal nursing rather than on the milk per se. Mothers may be reassured that they need not gain weight, that they may eat any food which agrees with them, and that they will not hurt the baby by moderate smoking. By introducing one bottle feeding a day for which breast milk

Presented at the 141st Annual Meeting of the Medical Bodiety of the State of New York, Buffalo Teaching Day May 6, 1947

may be used when it is abundant, the mother need not be tied down and may get an opportunity to go out socially or for business purposes. In general it should be made clear that maternal nursing will not continue for the whole first year, but that the important time is the period of the first three or four months, and the first month the mother is pretty much out of circulation anyhow. Food is introduced nowadays by the end of the second month, and unless the milk is particularly abundant nursing can be abandoned during the third or fourth month. For those who need it, reassurance may be given that the shape of the breast is changed rather by pregnancy than by nursing.

Success in breast feeding is dependent upon adjustments during the first few days, so that the first feedings will not become contests between mother or nurse and the baby, and what should be a pleasurable experience converted into unpleasant conditioning Recent observations by Norval<sup>3</sup> on the sucking response of fifty newborns at the breast showed that only ten were vigorous and sucked actively or even greedily, two were poor, and thirty-eight average last group grasped the nipple but tended to fall asleep, they could be started again, however, by a gentle pat The poor ones made only short feeble attempts at sucking She concludes that the average early response is not a greedy one but characterized by dallying and repetitious trials This should be met with patience at nursing and calm attempts to allow the baby to learn the gratification he can get from nursing, rather than with vigorous, unpleasant stimulation to this sensible viewpoint is the mechanistic manner in which infants are often handled in hospital nurseries with their rigid adherence to clock schedules Most of the difficulties could be avoided by attempting to conform to the infant's natural pattern and reflex responses plying the baby's cheek to his mother's breast will start him rooting with his mouth for the nip-Actual suckling follows the application of the nipple to the lips

# Artificial Feeding

It may seem paradoxical that after urging maternal nursing, I should now point to the highly successful feeding with cow's milk formulas. At present there is little enthusiasm for the establishment of wet-nurse registries. Even prematures have been found to do as well and even better on cow's milk formulas than on human milk <sup>4.5</sup> It has been pointed out that for infants too weak to be put directly on the breast, the feeding of human milk becomes an artificial procedure <sup>4</sup> This implies confirmation

of our emphasis on maternal nursing as a dynamic process rather than on human milk per se

Artificial feeding must be considered as a substitute for breast feeding. It became established through studies based on breast feeding. Twelve years ago, Dr. Grover Powers<sup>6</sup> of Yale gave a classical paper before the pediatric section of this Society, in which he traced the historical background of artificial feeding. Perhaps the two main contributions to the success of artificial feeding came from (1) better care of milk bacteriologically (pasteurization, refrigeration), (2) boiling milk to change the protein for better digestion.

Whether breast-fed or bottle-fed, the nutrition of the infant implies certain principles, which are not a matter of common sense but of scientific development. These will now be considered briefly <sup>7</sup>

Fluid Requirements—While the exact requirement for water has not been determined, it is relatively high during infancy. In the first half year, 2 to 3 ounces per pound per day is necessary Naturally, it varies with age, food intake, activity, surrounding temperature, and other factors. Ordinarily, the water requirement is met by the satisfaction of thirst. It is in sick infants that the chief danger of insufficient water is encountered, especially when there is vomiting, diarrhea, high fever, or excessive sweating. Both human and cow's milk have a water content of 87.5 per cent.

Caloric Requirement — The clinical measure of success in meeting calonic heeds is based on growth, general well-being, and satiety number of calones ingested can be safely left to the baby when the milk supply is adequate, except in the case of sick, feeble, or premature infants The full-term baby requires on an average 50 to 55 calones per pound, at one year, it is about 45 calories per pound For practical purposes, human and cow's milk can both be considered to yield 20 calories per ounce perience has shown that the proper distribution of calories is protein 15 per cent, fat 35 per cent, and carbohydrate 50 per cent In human milk, protein represents approximately 8 per cent and fat may be up to 50 per cent

Protein—As the word indicates, protein holds first place as an essential nutrient. Its nutritive value depends, so far as is known, only on the kind and number of amino acids of which it is composed. Of the twenty-two amino acids, ten have been found, by feeding experiments in rats, to be necessary for growth and development. One cannot say, however, that the other fourteen or more constituent amino acids are of no importance. Reliance for growth and

maintenance of health remains with the natural protein foodstuffs. Proteins of animal origin are about twice as efficient as those of vegetable On the basis of weight, an infant reouires approximately three times as much protein as an adult, as is also true for calories and The protein needs of a breast-fed infant are apparently met with 8 per cent of the total calories, with cow's milk it has been found ad vesible to give about 10 to 20 per cent premature infants, the higher level of protein in take is advocated, the explanation being that many of these infants have difficulty in digesting and absorbing fat a Human milk when fed in the amounts needed to meet the lugh requirements for maintenance and growth necessitates an excessive fluid intake and too high a level of fat. sometimes exceeding the tolerance. For these reasons heated cow's milk mixtures are often preferred for premature infants. 4.8.8

Protein besides being adequate in quality and amount, also must be denatured in order to produce fine curls. This is done in various ways, boiling being perhaps the most common. This also explains the present popularity of evaporated

milk

The protein needs in the breast-fed are not by 2½ ounces per pound. Cow's milk provides it with 1½ to 2 ounces per pound with a total of not over a quart for twenty four hours. With evaporated milk, from four-fifths to one ounce per pound is needed and the total for twenty four hours need not exceed one tall cau, or 13 ounces.

Fat—The human caloric requirements for fat are not well established. Of the various hilds, those known to be important nutritionally are fats (triglycerides) even though they may be synthesized in the body, unsaturated fatty acids, linoleic and arichidonic, which are not synthesized and certain plant sterols principally ergosterol which yields vitamin D on irradiation.

Cow's milk contains approximately 3 5 per cent fat It is more variable in breast milk which contains relatively larger quantities of the more readily absorbed clein Volatile fatty acids account for about 2.5 per cent in breast milk and 27 per cent in cow's milk

Carbohydrate —Lactoso makes 4.5 per cent in con's milk but 6.5 per cent in human milk Some form of carbohydrate to the extent of one-half to one onnee is usually put into formulas Recently there has been a tendency to keep the added sugar low or to leave it out entirely \*.\*\*

Minerals or Salts—The child's requirements for salts are relatively higher than the more maintenance requirements of the adult. It has been estimated that for each gram phosphorus retained in the body 0.3-Gm minerals also is deposited, so that if the protein is adequate the necessary inorganic material will be provided

Cow's milk contains three or four times as much mineral as human milk, but neither contains an adequate amount of from They have to be supplemented especially in promutures. In addition to iron, jodine calcium, and fluorine are likely to be deficient in amount and may need to be supplemented.

Construction of Formula -- The formula consists of milk water, and sugar Pyaporated milk has many advantages since the process alters the casein so that the curd is softer and smaller than that of boiled milk and approaches that of breast milk. It is also less allerconic. McCollum' recently has developed a supplemented evaporated milk, Formulae containing adequate amounts of vitainins and minerals The preceding principles can serve as a guide to the simple construction of formulas Since no two babies are exactly alike, the initial formula will have to be modified on the bans of the infant's response as shown by his growth and satisty. As solid food is added to the infant s diet there is practically never any need to give more than seven or eight ounces of milk at an individual feeding, or more than a tall can of evaporated milk, or more than a quart of whole milk during a twenty four hour period hardly should need emphasizing at this time that it is a human being who is to drink the formula that he seems to know how much he wants at his feeding and that he may wake up carly or late, or may ery for reasons other than hunger There is no basis in physiology for giving every ten-pound infant five feedings of exactly six ounces each, having a value of 500 calones.

Vitamins -Vitamins C and D have to be supplemented whether the buby is breast fed or bottle fed Of vitamin D 400 to 800 units daily are necessary and a greater relative amount is required by prematures. The vitamin D supplement provides also vitamin A. The need for A is greater in children with faulty fat absorption or liver disease. The average requirement for C is 30 mg but prematures need rela tively larger amounts, two or three times the average amount to aid in the metabolism of tyrosine and phonylalanine. Bottle-fed infants should receive ascorbe and or orange juice within the first weeks of life. The requirement in infants for macin is given as 4 mg, and for riboflavin and thiamin 0.4 mg each. Cow's milk contains 38 micrograms of thiamin per 100 ce while mature human milk contains, on the average 14 micrograms Similarly, broast milk

10

contains much less riboflavin than cow's milk, 37 micrograms compared with 200 micrograms On the other hand, breast milk is per 100 cc richer in macin, containing 183 micrograms in contrast to 85 in cow's milk per 100 cc When solid food also is given, it is obvious that the chief constituents of the vitamin B-complex are supplied ordinarily in sufficient amounts, though during fever or diarrhea the need for thiamin may be increased

# Summary

Common sense in infant feeding implies mu-The reasons for the decline in ternal nursing breast feeding are considered and the need for re-education is emphasized Maternal nursing as a dynamic process is stressed The principles governing infant feeding and vitamin require-

In both maternal nursing ments are reviewed and artificial feeding, cognizance is taken of the psychologic approach

# INDUSTRIAL MEDICINE

As recently as twenty-five years ago, a physician who accepted a position in "Industrial Medicine" was considered to have stepped down from a high professional plane to one distinctly lower It was assumed the quality of medicine practiced would be lower and that the doctor would become more and more commercially minded

Today, we see a very different picture Every great commercial or industrial organization has its medical department, and in some communities these departments are the leaders in professional advancement This development has gone hand in hand with expanding Public Health Departments, both state and national, and has been in step with the developing plans for prepaid medical and hospital care which have sprung up all over the industrial parts of this country

The vision and generosity of leaders of industry have been the chief factors in this growth Men capable of building a great complex business organization are men who understand using the best materials and employing the best workers When they began the medical departments of their industries they used the best equipment and they employed the best available nurses and doctors, or if they did not start this way their business sense soon showed them their mistake and they High rectified it with vigorous business action officials began to study other medical departments, began to inform themselves as to new public health methods, and the medical staffs were encouraged to broaden their field of activity What business asked of its medical men and women was a clear story of how to justify some additional installation If it paid in added efficiency, time saving, and better health of the employee, the cost could be met Too often the general public fails to understand how deeply the leaders of business feel their responsibility toward their personnel Even in so-called hardboiled organizations the welfare of the staff is a matter of importance, and this feeling of group unity has been one of the reasons for the development of industrial medicine to its present high level.

Today, industrial medicine is a well-developed branch of public health and is recognized and valued by the other subdivisions of the profession Last fall when the community was urged to inoculate against virus influenza, A and B, the medical departments of industry were among the first to act on this recommendation And recently in New York, all medical departments were vaccinating their personnel against smallpox, thus relieving the strain on hospitals and other public vaccination centers which would have been overburdened by the rush of people to protect themselves from infection.

As an educating force in the community, industrial medical departments rate high The constant example of careful work, good equipment, and intelligent advice is teaching a large and important element of the population higher standards of medical practice. All in all, the medical world has benefited by these departments and we may look for their continuance and their improvement through the years to come — Editorial, Journal of the American Medical Women's Association, June, 1947

# THE IMPORTANT INGREDIENT

It is often overlooked that the ultimate control of tuberculosis will depend upon the effectiveness of the training given to the infected individual. Case finding in tuberculosis is of little value unless it is followed by treatment, to go to a sanatorium is not as important as to remain there until the disease is arrested, the permanence of the arrest in any case of tuberculosis is always a matter of personal discipline and vigilance At every step of the road the physician must keep the conscious active cooperation of the patient.

This comes about only when continuous education of the patient is carried on by the physician and those associated with him.

# THE STUDY OF CERTAIN PATHOLOGIC PROCESSES WITH THE AID OF ISOTOPIC HYDROGEN\*

DeWitt Stetten, Jr MD, PhD, Boston Massachusetts

(From the Department of Biological Chemistry, Harvard Medical School)

DURING the past several years my collaborators and I have concerned ourselves largely with a study of the origin and fate of the reservoirs of carbohydrate and fat in the intact animal in health and disease—a study in which we have had frequent occasion to use isotopic tracers as an experimental device. In order to permit the presentation of our experimental results in proper perspective, it may be profitable to review briefly some of the underlying blochemical ideas current today.

Fig 1 presents a scheme familiar to most of you in which the several sources and fates of glucose are depicted. Glucose arises from carbohydrate of the diet from the breakdown of glycogen, and from synthesis from lesser fragments, and it may be pointed out that the latter two processes entail the hydrolysis of glucose-6-phosphate, a reaction that occurs in liver but not in muscle. Glucose in turn has many fates, notably its conversion into glycogen, fat, 3-carbon fragments, ultimately CO<sub>2</sub> and H<sub>2</sub>O among others, but in so far as is currently known, an initial phosphorylation catalyzed by the ubiq uitous enzyme hexokinase is an obligatory first step

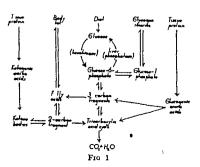

There is ample evidence for the occurrence in

the animal or in isolated systems of the several processes just outlined Of the relative rates of these reactions in the normal healthy animal. and of the alterations of these rates in disease relatively little is known with assurance biochemical analysis of the disease process often proves to be, not the institution of a new chemical reaction, nor the abolition of some normally occurring process, but, rather, an alteration in the rate of some normally occurring reaction In our studies we have considered the rates of glycogen synthesis under various conditions, the rate of glycogen breakdown, the rate of glucose synthesis from small fragments, and the rate of fatty acid formation. All the studies to be reported have been carried out on intact animals. in most instances in a uniform state of nutrition

First, a few words about technic. When deuterium oxide, heavy water, is added to the body fluids of an animal no perceptible change occurs in the functioning of that animal ever, from that moment on, in so far as stable hydrogen is introduced into the molecules of any synthesized compound, deuterium will appear in that compound, and as newly synthesized molecules replace pre-existing, nonisotopic molecules the deutenum concentration in that compound will nee toward some maximum value, tmax achieved experimentally only at infinite time. Clearly the rate at which new molecules are replacing old will be related to the rate at which the isotope concentration is approaching this maximal value The equation presented in Fig 2 represents the relationship between the isotope concentration, and time t when certain experimental conditions are met. k is the fraction of tissue constituent replaced per unit time. You will note that k is the slope of a straight line obtained when ln in in it is plotted

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo, General Sessions, May 7, 1947

<sup>\*</sup> The experimental work herein reported was carried out with the aid of grants from the Nutrition Foundation Inc and the Josiah Macy Jr., Foundation

$$k_{i} = \frac{1}{\ell} \ln \frac{\ell_{max}}{\ell_{max} - \ell}$$

TABLE 2

	L Days-1	t1/ Days
Liver fatty acids Liver glycogen Carcass glycogen	0 37 0 68 0 19	1 9 1 0 3 6

Given in Table 1 are analytic data for liver and muscle glycogens, as well as liver fatty acids, in normal adult rats on uniform high carbohydrate diets and at constant weight  $^1$ . The rise in deuterium concentration of each constituent with the passing of time will be noted, and the extrapolated values for infinite time are also included. For the graphic analysis of such data plots of  $\ln \frac{1_{\max}}{1_{\max}-1}$  against time are prepared (Fig.

3) and the slopes of the best straight lines determined. The numerical values of these slopes are given in Table 2. It will be seen that each day some 70 per cent of liver glycogen, and some 20 per cent of muscle glycogen are replaced by newly synthesized material in the normal adult rat.

Stated another way, the half life of liver glycogen is about one day, of muscle glycogen about three to four days. Combining these figures with the quantities of glycogen known to occur at these sites, one may calculate readily the weight of glycogen synthesized and destroyed daily by these rats. The value arrived at was 0.44 Gm per day. In other words, only about 0.5 Gm of glucose was consumed each day in the maintenance of the body glycogen stores, and this in spite of the fact that our rats were eating 1.5 Gm of glucose daily in their diets, or 30 times as much

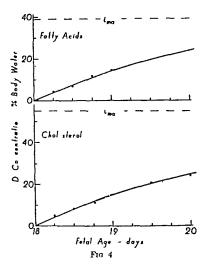

With the fate of only some 3 per cent of the ingested glucose accounted for as glycogen, the fate of the remainder was naturally a matter of interest. From similar data obtained from the body fats, it could be shown that about 2 Gm of fatty acids were synthesized each day by rats on a fat-free diet to replace body fat that was simultaneously being destroyed, and it could be estimated that some 5 0 Gm of glucose were consumed in this process. In other words, about

10 times as much glucose was utilized each day to replenish body fat stores as to replenish body glycogen

The conclusion that we have reached on the basis of this type of study is that the rat not only contains a great deal more fat in his body than glycogen, but, in units of grams per day, he turns over a great deal more fat each day than glycogen. A much larger fraction of the carbohydrate of his diet is consumed each day in the maintenance of body fat than in the maintenance of body glycogen stores.

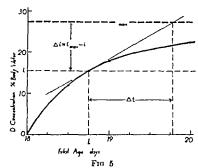

An interesting contrast to this situation in the adult rat is that provided by the rat fetus fetus in general is notably poor in depot fat and extraordinarily rich in glycogen Whereas the adult rat contains from 20 to 50 times as much fat as glycogen, the rat fetus contains about equal quantities of these constituents We have completed just recently a series of studies on this interesting experimental animal, employing much the same technic as that previously employed in the adult 2 We observed, in other words, the rate of the incorporation of deuterium into fatty acids, cholesterol, and glycogen of the eighteenday rut fetus after the administration of heavy water to the maternal organism A graphic presentation of some of the results is given in It will be seen that the deuterium concentration in the fetal fatty acids, as well as in the cholesterol, rose rapidly, and achieved half of maximal value in each case in about two days This indicates that about half of the fatty acids or cholesterol present in the fetus, at this stage of development, had been synthesized in the preceding two days Unfortunately, it is difficult to state with certainty, the extent to which this

synthesis occurred in the fetus, in view of the fact that we were able to demonstrate unequivocally the transplacental passage of both fatty acids and cholesterol. This demonstration hinged upon the feeding to the pregnant rat of isotopically labeled fatty acids in one instance and cholesterol in another. The abundant presence of isotope in the corresponding fetal products proved that these materials do cross the rat placenta from the maternal to the fetal side.

The synthesis of glycogen by the fetus has been studied by the same process (Fig 5) I shall not trouble you with the details of the mathematical analysis, other than to point out the rapid smooth enrichment of fetal glycogen with воторе From the shape of this curve we have been able to calculate that the rat fetus of this age manufactures each day a quantity of gly cogen equal roughly to the quantity that it contains If the fetus did not at the same time destroy glycogen this would lead to a daily doubling of its glycogen content. The fact that the glycogen content is increasing only about 40 per cent per day at this stage of development, indicates a rate of glycogenolysis of about 60 per cent of the synthetic rate

Per gram of tissue the quantity of glycogen which the fetus is making and destroying daily is impressively greater than the corresponding rate in the adult rat. On the other hand the rate of fatty acids synthesis by the fetus in com-

parable terms, is far slower than in the adult. It has seemed to me that these findings have an altogether reasonable meaning and I should like to present for your amusement my interpretation of them

When energy is to be stored for a protracted period in a living cell there appear to be two general processes available, both of which involve removal of a large, organic molecule from the continuous watery phase. The one is the gen eration of polysacchandes, such as glycogen or starch, the other the deposition of fat. In many simpler forms of life, polysacchande formation seem to be predominant, and indeed, there would appear to be little advantage in the storage of large fat depots in such forms Only when survival of the individual or of the species is dependent upon motility does a real benefit in the abundant storage of fat over carbohydrate If one stores fat in preference to poly sacchande, per calone stored one is required to carry around less than one half as much weight, and it follows therefore that, for a given caloric reservoir the fat-storing organism will be more motile than the polysaccharide storer

In the vegetable world one usually encounters vast carbohydrates stores and scanty fat stores. A striking exception is found in certain seeds like the cotton seed in which fat abounds. Sav ing of weight in such a seed is obviously of benefit to wide dissemination which in turn favors the survival of the seed and of the species. In the animal kingdom, in general one finds much fat and little polysacchande A striking exception is noted in mollusca, which are very rich in glycogen and poor in fat, but the mussel, other wise defended does not depend upon motility The rat, on the other hand, is a for survival very motile animal. Although his diet may be largely carbohydrate the material derived from that diet for storage is predominantly fat and

the rat's agility and his survival is, in some measure, the happy consequence of this fact. Were he to store glycogen isocalorically in place of fat, his weight necessarily would increase perceptibly.

Our findings in the rat fetus we take as a kind of biochemical atavism. In contrast to the adult, the fetus has proved to be fundamentally a glycogen-storing organism, resembling in this regard the vegetable forms. The rat fetus is like the common vegetables in other regards and of interest here is the fact that his survival is not dependent upon motility. He, further, has no need as yet for the thermal insulation and mechanical cushioning afforded by a subcutaneous layer of adipose tissue.

In the light of this discussion, the glycogen stores of the mammalian liver begin to resemble a Darwinian vestige. It is obvious that liver glycogen in the contemporary mammal does serve a function as a reservoir of energy and of glucose. It is a very small reservoir, however, and when it has been exhausted no drastic clinical change is demonstrable. If you will recall in the first figure, glycogen was situated as a cul-de-sac off the main line of reactions whereby glucose is burned to CO<sub>2</sub> and H<sub>2</sub>O, and I would suggest that it resembles that other cul-de-sac of wide repute, the vermiform appendix, in more regards than one

After this philosophic excursion, I should like to carry you back to the laboratory again. I have already pointed out to you how we have taken advantage of the relationship between the rise in deuterium concentration of glycogen and the rate of its turnover. There is another factor which determines in part the concentration of deuterium in any particular sample of glycogen, namely, the nature of the precursor. In Table 3 are collected data designed to show the nature of this relationship 4.5 Glycogen has, in each

case, been allowed to accumulate in the liver of the previously fasted rat, one or another glycogenic substance serving as precursor. The, point that I wish to make is that the formation of glycogen from small fragments, like lactate, results in the appearance of high concentrations of deuterium in the glycogen sample, when compared with glycogen formed from, let us say, glucose The reason for this is that only by chemical reaction involving the carbon-bound hydrogens is deuterium introduced into glycogen and more such reactions intervene between lactate and glycogen than between glucose and glycogen

An example of how this may influence expenmental results is seen in our study of the thiamin deficient rat 5 From the point of view of glvcogen synthesis, this animal presents two peculiarities In the first place, due to anorexia, probably less glucose is presented to the liver In the second place, due to the roles of thumin pyrophosphate in various enzyme systems. many normal dispositions of pyruvate are hindered, and the blood level of pyruvate rises experimental observation in the thiamin deficient rats receiving deuterium oxide was that whereas very little glycogen was found in their livers, what was found was about twice as rich in deuterium as the control value (Table 4) The glycogen that was laid down in the livers of the deficient animals apparently was made largely from pyruvate rather than glucose

TABLE 4 — DEUTERIUM CONCENTRATION IN LIVER GLYCO-GEN OF NORMAL AND THIAMIN DEVICIENT RATS

Normal Thiamn-deficient	Mg Glycogen per Liver 8 1 0 5	D Percentage of Body Water 18 7

Similar observations have been made on the action of adrenalin in the fasted rat. You will recall that whereas in the well-nourished animal, the major effect of adrenalin is to provoke a decrease in liver glycogen and a rise in blood glucose, in the fasted animal, deficient in liver glycogen, adrenalin administration is followed by an entirely different sequence of events Previous workers have shown a fall in muscle glycogen, a rise in blood lactate, and a secondary rise in liver glycogen They suggest that the liver glycogen that appears is formed from the lactate which the muscle discharges argued that in this event the liver glycogen should resemble isotopically that formed when lactate was fed and from the figures in Table 5 it will be seen that this expectation was gratified. As the Cons had postulated,7 it would seem that the

TABLE 5 — DEUTERIUM CONCENTRATION IN LIVER GLICO-GEN AFTER INJECTION OF ADDRESALIN

Treatment	D, Percentage of Body Water
Glucose Lactate	88 1 57 0
Adrenalin	56 <b>2</b>

glycogen appearing in the liver of the fasted rat in response to adrenalin is formed from circulating lactate.

The alterations that we have observed in the diabetic rat are indicated by data in Table 6 \*

TABLE 0

	PER Liver Gly- cogen	CENT OF I Carcass Gly cogen	DEUTERIO Liver Fatty Acids	Depot Fatty Acids
Allozan diabetes, glucose dist Phlorhisin poisoning	43 1 16 1	23 3 9 1	9 1 17 0	9 0 7 2

Despite the decrease in quantity of glycogen, the appearance of deuterium in glycogen of both liver and muscle proves that glycogen synthesis was still proceeding. The deuterium concentrations observed in these samples were, in fact, much higher than were found in normal rate after the same time interval, indicating that the glycogen deposited in the diabetic rats was being formed preferentially from small fragments rather than from glucose directly In the same animals. from the quantities and deuterium concentrations of liver and depot fatty acids it could be calculated that fatty acid synthesis was proceeding at only about 5 per cent of the normal rate. In others words, this particular fate of glucose lipogenesis, had all but stopped, and the 5 Gm of glucose which in the normal rat were consumed daily in this process were not utilized in the diabetic rat and contributed to the glucosuma

The liver fatty acids of the diabetic rabbit (Table 7) revealed a similar tendency 10

TABLE 7

	PER	CENT OF I	DEUTARIUM	IN
	Liver	Depot	Liver	Caross
	Fatty	Fatty	Glyco-	Glyco-
Treatment	Acids	Acid:	gen	gen

Normal control	6.6	0.8	<b>2</b> 8 C	4.6
Normal + insulin	26 1	2.3	8.6	3.7

Here again the deuterium concentrations were significantly below that of the normal control live fatty acid, indicating an impairment in the dia bette in hepatic lipogenesis. In the rabbit, in addition, we have been able to show the converse of this effect, something which to date we have not been able to show in the rat. The injection of insulm into the normal rabbit resulted in a marked increase in the deuterium concentration of the liver fatty acids, the value reaching 4 times the normal level and 10 or more times the diabetic level. This can only be accounted for postulating a tremendous increase in the rate of lipogenesis incident to insulin administration

The extra synthesized fat is, apparently, in part transported to the depots, as indicated by the rise both in quantity and deuterum concentration of the depot fat, and I should like to suggest that this stimulus to lipogeness may contribute to the weight gain observed when insulin is administered to underweight individuals.

When insulin is injected into the rabbit, a massive increase in the quantity of glycogen in liver and in muscle results. This glycogen, in both sites, is poorer in deuterium than that of the normal control which indicates that it has been formed fairly directly from glucose of the dist, without much opportunity for introduction of deuterium from the body water.

We have carried out several studies on the nature of the unnary glucose in these diabetic animals and Table 8 shows the type of results obtained.

TABLE 8

Urine Volume Gueose Gm Alloxan diabetes 281 14 2 Phlorihirin poisconing 24 3 3	Glucose Synthe- sised, Gm. 3 6	Glucose Synthe- sized, Per centage 5 4
--	--	---

From a comparison of the deuterium concentration in the urine water and the urine glucose it is possible to estimate the fraction of all the glucose that was synthesized and the fraction that came directly from the diet. Because normal animals do not exhibit glucosuria, we have of course, no normal controls in this case. However, we have compared the calculated fraction of urinary glucose synthesized in the truly diabette and in the phlorhizinized rat, and from this it would appear that certainly no more, possibly less gluconeogenesis occurred in the diabetic than in the phlorhizinized rat.

Summary

I should like to allocate these effects with respect to the diagram presented in Fig 1 The diabetic animal makes glycogen, but the glycogen that he makes is excessively nch in deuterium and we postulate is made from small fragments. His ability to convert glucose directly into glycogen definitely is impaired Likewise he is almost unable to convert glucose into fatty acid Ample respiratory quotient data indicate an impairment of his ability to convert glucose into CO, and the atudies of others 11 suggest an inability to convert glucose into 3-carbon fragments

The administration of insulin in each case favors the utilization of glucose. As we have shown an abundance of fatty acid is synthesized.

although a relatively large concentration is required. It indeed may control cholinesterase activity, because of physical conditions or local concentration effects. Since the action of neostigmin is also postulated through its inhibition of cholinesterase, it seemed worth while to try a combination of these two substances instead of thiamin alone. Because of the excellent results obtained in our cases of herpes zoster, it seems probable that the addition of neostigmin to thiamin is a true potentiating effect.

# Method of Treatment

As soon as a diagnosis of idiopathic herpes zoster was established, 1 cc of thiamin chloride (100 mg per cc), and 1 cc of neostigmin methylsulfate (1 2000), in the same syringe, were given intramuscularly The injection was repeated every other day until the severe pain was relieved The number of injections required to induce relief varied Various factors were involved, as can be seen from the table. The age of the patient was very significant, since the older patients usually had more severe pain and were most apt to suffer postherpetic neuralgia In one instance (Case 4) no relief followed nine The pains became more severe paravertebral injection of the combined thiamin and neostigmin, placed at the corresponding dermatome, brought relief after the first injection of this type and complete relief followed four injections of this type Whether a local concentration was effective here is problematic 10

The duration of symptoms prior to treatment was significant in view of the results which showed that the earlier treatment was started the faster the recovery—There were several failures. The several patients who failed to return after a few injections also were classified as failures. Cases treated by the authors in previous years with nonspecific therapy such as narcotics, analgesics, local applications, and ultraviolet therapy were considered as controls in the evaluation of this new form of treatment—Of 20 such control cases, the average duration of symptoms persisted for approximately six weeks—In these cases, the pain was excruciating in the first ten days, despite the therapy

Six cases of neuralgia were treated by one of us, but these were not included in the table, since all four failed to develop the vesicles characteristic of herpes zoster. It is possible that these were preherpetic pains, since they presented themselves at a time when several other cases were seen. The results in these 6 cases were remarkably good.

## Comment

The remarkable response in our series of cases of herpes zoster makes it appear probable that the neostigmin aided in relieving the pain by potentiating the action of thiamin Neostigmin, however, may have a primary action of its own

# Summary

Twenty-three cases of idiopathic herpes zoster were treated by a combination injection consisting of 1 cc of thiamin (100 mg per cc) and 1 cc neostigmin methylsulfate (1 2000)

The results were sufficiently impressive to

warrant definitely further trial of this mode of therapy

# THE CARE AND EDUCATION OF THE TUBERCULOUS PATIENT IN THE HOSPITAL

The care of a patient in any institution is depend. ent upon the physical facilities of the hospital or sanatorium the proper balance of staff and the quality of the staff. An adequate budget is necessary but money is not the entire answer. A well-equipped sanatorium may still be a cold, unsym pathetic place. There must be an caprit de corps that starts at the top and carries through to every worker in the place.

The importance of a proper balance of staff is self apparent. There must be enough physicians enough nurses a satisfactory dictotic service, enough social workers, enough rehabilitation workers and enough accessory attendants to carry on the work properly

The quality of the staff will depend upon the training the experience and the personal interest of every person who takes part. Adequate salaries are necessary to attract and hold competent personnel.

There should be frequent and regular staff conferences not for the physician alone but for the entire administrative group the nurses social workers, and rehabilitation workers. Not only medical and surgical treatment, but problems of discipline, emotional instability and psychological approaches should be discussed. The staff should all learn to think as a unit. As a result, when a physician advises a patient and the patient asks the same question of the nurse or the social worker there will be agreement among them Some may feel that only a doctor should discuss medical subjects and that nurses social workers and others should always refer such questions to the doctor That is true if the answers are difficult, but no doctor ever loses prostige when his staff gives him informed backing and support,

In the treatment of tuberculosis the work of the doctor the nurse the social worker and the rehabilitation worker so dovetail that they are frequently helping with the same thing All four practice medicine in some way whether it be in troatment, care, or maintaining the proper mental equilibrium of the patient. All four do a certain amount of nursing service. All four may be drawn into the domestic problems usually handled through the social worker And all four take a part in re-babilitation. The direction and supervision of the work should be clean-cut, but the better the under standing, the more effective will be the cooperation between staff members

The other half of the work is the education of the patient which is carried on through personal contacts of the staff, talks and lectures, books and periodicals on tuberculosis, sanatorium publications, and visual aids of all kinds. The education of the patient

starts with the day that the diagnosis is made. Then the first shock is received and the patient s little world crumbles around him Often he loses everything for which he has worked saved and planned Usually he enters the sanatorium in a condition of mental chaos

It is the job of every person who is in touch with this patient to sympathize, to help to encourage and to gain his confidence. The hope and assurance of recovery must be instilled his family problems must be met and his rehabilitation started at this time.

At first the patient is too stunned to appreciate or understand the rules of the game, but his education must start right at the beginning. It is important that the attitude of every staff member should be that of a teacher giving the patient the hints and the rules which will be short cuts to recovery Opti mism should be the keynote.

When the first shock has worn off the patient is in the mood to be a pupil in our school for tuberculosis He will listen to other patients and get distorted ideas, he will listen to anyone and everyone. It is important therefore, that his information be

authentic.

The patient should be taught how tuberculous develops how it is diagnosed and how it can be provented. He should understand the different types of treatment and the objective of these treatments He should be made to realize that his cure is within He should be taught how the disease is himself spread and how to protect others. When this is done we have reduced the hazard nearly 90 per cent. The patient should realize the importance of followup examinations long after discharge. He should know the length of time that it takes before he will be well even after returning to a productive life. Too often the patient is discharged with a good prog nons from an institution but because his education has been incomplete, he becomes carcless and as a result has tuberculosis recurs.

The responsibility for patient education does not belong to doctors alone. It is the responsibility of every nurse every social worker and every rehabili tation worker who comes in contact with the patient The sanatorium should not be a jail but it should be a school for the education of the patient, and disci-pline is just as important as medication and treat ment. A well-educated patient who leaves the sanstorium with consent and is well on the road to recovery soldom breaks down again It is the careless patient who didn't learn the lesson who comes back to be readmitted .- Let a Improve the Care and Education of the Tuberculous Patient in the Hospital Howard W Bosworth MD, Transactions of the Vational Tuberculous Association, 1946

# CLINICOPATHOLOGIC CONFERENCES

FOURTH MEDICAL DIVISION OF BELLEVUE HOSPITAL, New York City

Date April 28, 1947

Conducted by Max-Wilhelm Johannsen, M D

# ADENOCARCINOMA OF THE CECUM WITH INVOLVEMENT OF THE LUNGS

DR WILLIAM A LEFF R K, a 42-yearold white man, was admitted to the Fourth Medical Division of Bellevue Hospital on January 17, 1947, with the chief complaint of a severe cough and chest pain of three months' duration and hoarseness for three days prior to He had had a "cigarette" cough admission from the age of thirteen, but this cough had become progressively worse during the past fifteen years manifested particularly by productivity of thick white sputum During the past three years his cough had been productive of about 500 to 800 cc daily, but was never bloodtinged or foul For three months prior to admission to the hospital, he had noticed blood streaking and small blood clots in the sputum There had been a 40-pound weight loss in the past He had worked very little during six months the past year because of his "run down" condition There had been no abdominal pain, vomiting, diarrhea, constipation, melena, or hematemesis Three days before admission he noticed hoarseness, marked weakness, a steady cough productive of blood-tinged sputum and pain in the chest

Physical examination revealed a patient who was chronically ill, pale with some cyanosis of the lips, emaciated, and dyspneic He coughed up blood-tinged sputum, complained of pain in the throat upon coughing, and was slightly hoarse The blood pressure was 120/70, respirations 28, pulse 100, and temperature 1015 F The conjunctivae were markedly inflamed The tongue was dry and beefy red The chest was symmetrical There was dullness in the left posterior axillary line with fine rales over the right middle lobe, and rhonchi throughout the entire The heart was not enlarged to percussion, there was regular sinus rhythm No murmurs were heard The second aortic sound was greater than the second pulmonic sound abdomen was soft, not tender, and no organs or masses were palpable There was no edema of the extremities

On admission the sputum examination was negative for acid-fast bacilli. A blood culture was reported negative. A complete blood count on the third hospital day showed 16,000 leukocytes with 84 per cent polymorphonuclears, 8 per cent lymphocytes, and 2 per cent monocytes. The red blood count was 3,340,000 with 9 4 Gm of hemoglobin

The patient was placed on penicillia therapy on the second day to which there was no response after forty-eight hours and sulfadiazine was started in its place Within two days the temperature fell to normal, but the patient appeared only slightly improved The sputum culture was reported to contain pneumococci which did not type, streptococci, Staphylococcus aureus, and hemolytic streptococci Examinations of the sputa were repeatedly negative for acid-fast On the sixth day the white blood count was 7,600, the patient appeared much less toxic and the amount of sputum had decreased His temperature remained normal for about three days, then commenced to rise slowly With this rise in temperature he was again given penicillin, both by aerosol and parenterally (40,000 units every three hours)

On the minth hospital day he started to vomit and could retain very little food. On this day one observer described a slightly tender elongated mass, "stony hard," in the right lower quadrant which "could not be indented with the finger" The vomiting persisted for the next four days and he was transferred to the Surgical Service on January 31, 1947 On the eleventh hospital day the white blood count was 11,200 with 80 per cent polymorphonuclears, 13 per cent lymphocytes, 3 per cent monocytes, and 2 per cent eosinophils The red blood count was 4,200,000 with 92 Gm of hemoglobin stool specimen for occult blood was reported as two plus A second sputum culture on the eleventh day showed pneumococcus (no type), Staph aureus, gram-negative bacilli (B coli), Str vindans After several days on the Surgical Service he developed cramp-like pains and vomited fecal material A Miller-Abbott tube was inserted and the patient was given two trans-He suddenly developed acute dyspnea and failed to respond to either oxygen or any other emergency measures His temperature mounted to 103 5 F and he expired on the seventeenth hospital day

Fig 1 Admission postero-anterior view of cheet showing bilateral abscerees with fluid levels and surrounding areas of pneumonning

Interpretation of X Rays —The admission film a posteroanterior view of the chest, revealed the bones and soft tessues to be normal (Fig. 1) There was some irregularity of the right diaphragm with cloudiness in the right costophrenic angle. The heart and mediastinum were normal In the left lung there was a cavity 21/2 inches from the hilus from the fourth to the aixth ribs antenorly measuring one inch in diameter with a fluid level, the upper margin of which was thin-walled, the lower and lateral margins appeared to be surrounded by areas of pneumonitis Extending out from the hilus there were soft infiltrations In the right lung one inch from the hilus there was a cavity at the third right rib measuring one inch in diameter which was thin walled with soft infiltration in the third, fourth and fifth interspaces In the lower third of the right lung there appeared to be several small areas of highlights and this infiltration extended down to the right diaphragm On January 29, eight days later the posteroanterior view showed the cavity to be one-half the size of the original description the wall was thin and the pneu monitis had somewhat subsided On the right the cavity was barely visible but there were several small areas of highlights surrounded by

Fig 2. Right anterior oblique view of the chest showing the empty cyst like cavities.

soft infiltrations The opacity described on the first film was still present but to a lessor degree. At the right bilus there was an irregular infiltration which seemed more opaque than the surrounding areas of infiltration in the lung

The right anterior oblique view showed either several cavities superimposed or a multilocular cavity with very tlun walls, measuring two inches in diameter and situated in the middle of the leftlung (Fig 2). The lower third of the posterior portion of the right lung showed several highlights surrounded by soft infiltration. The left an terior oblique showed a cavity in the lower third of the posterior portion of the left lung and infiltration throughout the middle portion of the right lung.

The barum enema showed normal filling of the large colon with little barum seen beyond the ileocecal valve (Fig 3) There were numerous large areas of gas apparently in the small bowel. One view showed a small amount of barium in the ileum which appears irregular

#### Discussion

DR MAX WILHELM JOHANNSEN If I may review the history it is stated that the patient had a cough for approximately thirty years and that in the last three years he rulsed 500 to 800

Fig 3 Barium enema showing filling defect at ileocecal junction

cc of a nonodorous, nonbloody sputum in twenty-Whether the daily sputum output four hours was measured or not, I do not know questionably, however, he raised large amounts This history suggests a chronic, bronchial catarrh resulting, probably, in chronic bronchiolitis, but I do not believe that it has any bearing on his present condition The latter reveals the Historically, the involvement of two systems pulmonary system manifests itself first by a severe cough and chest pain of three months' The history does not state where the duration chest pain was, whether it was localized or diffuse, its character, or what initiated it or relieved It states, however, that lately the sputum had become bloody, indicating an ulcerative The examination of the lung revealed process either the presence of some fluid in the left chest or consolidation of the lower left lung and evidence of pneumonitis in the right middle lung field

During the first hospital days, all symptoms and signs pointed to the respiratory tract and the response to sulfadiazine medication seems to indicate that the process was a pyogenic one and localized in the lung. When, however, on the minth hospital day, the second system involved in this case manifested itself, the entire picture changed. The patient began to vomit and a mass was felt in the right lower quadrant.

of the abdomen which, heretofore, had been normal to examination. Shortly afterwards, the patient developed signs and symptoms of low intestinal obstruction.

If we tried to correlate the pathology in this case with one disease, the differential diagnosis would be. I believe, mainly between tuberculosis and a malignancy Tuberculosis of the intestines occurs especially in the ileocecal region. and in a patient exhibiting evidence of obstruction due to tuberculosis, we ought to expect signs of a tuberculous peritonitis. This, the patient The pulmonary findings then did not have would be a manifestation of a chronic protracted lymphohematogenous dissemination and the patient would have run a more septic course With bleeding from the pulmonary tract indicating an ulcerative process, it would have been reasonable to assume the presence of acid-fast organisms in the sputum. The sputum was persistently negative for tubercle bacilli

The other possibility to account for the chest pain, namely, a malignancy with metastases to the lung and pleura seems more likely I would place the site of malignancy in the cecum because a carcinoma here is notoriously silent. Also, the diagnosis is frequently not made for as long as six months after the onset of symptoms pointing to another system It is not surprising, therefore, that the primary manifests first in the pulmonary tree, caused by the dissemination of carcinoma cells by way of the lymphatics chest pain, weight loss, low red blood count, and hemoglobin are of little value in differentiating between tuberculosis and malignancy Inasmuch as I had not seen the x-ray films of this patient until this conference. I presented the case the way it seemed to me to be reasonable with the data available

The \rays show fairly large-sized cavities in the left lung and smaller ones in the right lung with surrounding areas of pneumonitis colon fills well up to the ileocecal valve presence of cavities in the lungs confuses me and I am glad that I had no knowledge of their existence up to now because my speculations of a carcinoma of the cecum with metastases to the lungs would have seemed rather dubious Although metastatic nodules may break down and form small cavities, I think large-sized cavities are unusual but may well be present in bronchogenic carcinoma Nevertheless, the upper lung fields are clear and even now the picture is not that of tuberculosis There is no evidence of actinomy cosis which spreads usually by direct continuity rather than by blood stream, and I think I had better maintain my original impression of carcinoma of the cecum with metastases to the lungs

DR. MAX TRUBER The notation that this patient appeared acutely and chronically ill is apt in this case. There was a cough of in creasing seventy for over fifteen years with over one-half liter of sputum daily. He presumably had bronchectasis.

Within recent months there was blood streaking loss of weight, increased cough and eventually hoarseness. Except for cleest path there was no other systemic localization.

The physical findings over the lungs do not permit an interpretation Tuberculosis was never verified. There was a moderate anemna and an accelerated downhill course. I would suspect a pulmonary malignancy probably bronchogenic rather than metastatic because of the pre-existing bronchial pathology, and the final illness seemed to be an accentuation of previous symptoms.

The houseness apparently was not pronounced and was not further identified. It was too recent to be due to intrinsic disease of the larying, if there was cord paralysis neoplasm would be a likely cause for the recurrent laryingent nerve involvement. After one week he suddenly developed symptoms of acute intestinal obstruction a primary neoplasm would have given previous evidence of its presence. No mention was made of a mass or hernia on initial examination, the white blood count was normal preceding this episode.

Dr. Harry A. Solomov The case history indicates that this patient had respiratory symptoms since childhood. From the profuse expectoration bronchiectass could be inferred

With the insidious development of marked weight loss and weakness, another condition lad set in—chronic progressive and serious in character. A nonspecific superimposed respiratory infection alone could hardly explain his serious deterioration, yet the symptoms were exentially respiratory, the sputium showed only mixed progenic organisms and the physical signs in the chest were those of diffuse bronchitas with several scattered areas of parenchymal involvement. That the hearseness was due to laryngeal inflammation in their than vocal cord paralysis was suggested by the association of pain in the throat

The colon bacilli found in the second sputum culture was probably a contamination from the fecal vomiting rather than a fistulous communication between the lung and intestinal tract

As regards the acute abdominal symptoms with a tender mass in the right lower quadrant and intestinal obstruction with fecal vomiting the absence of pain should exclude mesentence embolism from the pulmonary vens intussus-seption, acute appendicitis or other acute

conditions from a more chrome lesion, either neoplastic or infectious

Whether the mass in the abdomen (with acute intestinal obstruction) is an independent lesson from the lung pathology is difficult to say. My final diagnosis is (1) childhood bronchiectasis, (2) multiple lung abscesses (3) embolic mesenteric thrombosis from pulmonary thrombophilelities and (4) possibility of neoplasm

Dr. WILLIAM A LFFF Dr Appelbaum, would you please comment on the importance of the gram-negative bacilli in the sputum?

DR. EMANUEL APPELBAUM The presence of the B coli in the sputum is not too significant in this case. One may find a super emergence of grain negative organisms after penicillin therapy

DR. ALLAN R ARONSON Was actinomy costs considered?

On WILLIAM A. LEFF The sputum was searched for sulfur granules, but none were found Cultures were likewise negative

Dr. Samull Myerson Granuloms should be considered as a cause for the involvement of the terminal fleum

Dr. Zachary Sagal There is nothing here to suggest a malignant process of the cecum There is usually chronic disease of the abdomen this is not the case here. The mass was discovered late and I believe this is an acute inflammatory condition of the terminal ileum not a neoplasm.

DR Cowin Boros The configuration of the barium enema does not conform to the usual expectation of a malignant process. It suggests an inflammatory or granulomatous process.

DR WILLIAM A. LEFF Dr Johannsen, now that you have seen the x rays of the chest and barium enema how do you correlate these findings?

Dr. Max Wilhelm Johannsen It is obvious that the patient had lung abscesses but mediastunal lymphadenopathy which I had expected to be present to explain the hourseness and wheezing is not seen. Although lung abscesses are not infrequently seen in primary carcinoma of the lung this would be the first instance in which I had seen lung abscesses in metastatic lenons. The barium enema, however still is entirely consistent with carcinoma of the cecum It is well known that carcinoma of the cecum is not always visualized even by careful examination Actinomycosis is unlikely because it is always spread by direct dissemination, hemntogenous spread is rare I think that I had better maintain my original impression of carcinoma of the cecum with metastases to the lung and pleura

Clinical Diagnosis Caremonia of cecum with metastases to lunes

# Presentation of Pathology

DR HENRY SPITZ The anatomic diagnosis n as

Adenocarcinoma of Cecum with Direct Extension anto Adherent Loop of Ileum, Necrosis, and Perforation

Fecal abscess, retrocecal, perforated Acute diffuse peritonitis Paralytic ileus, clinical Secondary carcinoma in diaphragm, pleurae, and pulmonary lymphatics Pleural effusion, bilateral (100 cc)

Secondary Carcinoma in Lungs with Central Necrosis and Capitation

Congenital anomaly of kidneys-Horseshoe

At autopsy the body was found to be that of a well-developed but thin, middle-aged, white The mucous membranes of the mouth were pale

On opening the abdominal cavity, all of the visceral and parietal peritoneal surfaces were markedly congested and covered with a thin laver of fibrin The peritoneal cavity contained 500 cc of light brown thick fluid with a fecal The loops of the small intestine were dilated and filled with gas A firm, whitish mass of tumor tissue was seen to involve the cecum which was fixed to the anterior abdominal wall by thick fibrous adhesions, also, a loop of the ileum and the omentum were adherent to the cecal mass On dissection the tumor mass was found to be hard, and nodular, involving the The mucosa over the wall of the entire cecum tumor mass was ulcerated and bleeding and the mass constricted the lumen of the cecum and first portion of the ascending colon to a diameter of 15 cm

A loop of ileum 20 cm from the ileocecal valve was adherent to the cecal mass and the neonlasm had extended into the ileum without reaching the mucosal surface The wall of the cecum was perforated at its lateral aspect The perforation communicated with a retrocecal abscess that had perforated medially and behind the cecum into the peritoneal cavity. The other abdominal organs showed no important changes except for the kidneys The kidneys joined together at their inferior poles to form a "horseshoe" type of There was a slight dilatation of the right kıdney renal pelvis

On opening the thoracic cavity a few fibrous pleural adhesions were found in each pleural cavity There was 100 cc of pinkish, serous fluid in each pleural cavity and the parietal pleural surfaces were smooth and glistening

The right lung weighed 720 Gm and the left lung, 620 Gm The pleural surfaces of both lungs were studded with numerous, small white nodules some of which were connected by thin white cords in the pleum. On section, several firm roughly spherical, whitish masses of tumor tissue with soft necrotic centers were seen in each line These masses varied from 2 to 8 cm in diameter. two of the largest tumor masses were located in the lower half of the left upper lobe beneath the pleura, they had eroded into the bronch and cavities were formed by the loss of the necrotic centers The remaining lung parenchymashowed slight congestion and edema The bronchi contained a mucopurulent exudate The hilar lymph nodes were small, firm, anthracotic, but showed no gross evidence of neoplastic invasion The diaphragm was studded with small, firm, white nodules of tumor tissue measuring 3 to 7 mm in diameter

The heart, bone marrow, neck organs, and pelvic organs showed no important gross changes

Microscopic examination of the mass involving the cecum showed adenocarcinoma, extensively ulcerated, extending through all the layers of the bowel wall On the outside of the cecum there was an extensive, chronic, organizing, inflammatory reaction The diaphragmatic nodules were composed of adenocarcinoma identical with that seen in the cecum Sections of the lungs showed that the perivascular, peribronchial, and subpleural lymphatics were extensively invaded by tumor cells resembling those seen in the cecum In many areas the tumor cells invaded the walls of the bronchi and spread into adjacent lung parenchyma using the intra-alveolar septa as stronal scaffolding In some areas extensively involved by the adenocarcinoma, there was central necross of tumor tissue. The noninvolved portion of lung showed edema, moderate emphysema, and in one area a small patch of organizing pneumonia

# Summary

This was a case of secondary carcinoma in the lungs with central necrosis and cavity formation with the primary adenocarcinoma in the cecum Extension of carcinoma from the cecum to the lungs is uncommon, and cavitation of secondary carcinoma in the lungs is extremely rare ever, in this case the metastatic neoplastic type of the lung lesion suggested itself clinically by the following points a palpable mass in the right lower quadrant of the abdomen, cavitation of the lower half of the upper lobe, and consistent failure to demonstrate acid-fast bacilli in the sputum

#### LATERAL WALL INFARCT IN THE BASAL REGION OF THE LEFT VENTRICLE

STEPHEN MAJOR, M.D., Binghamton, New York

A CASE of coronary occlusion is presented because nonspecific electrocardiographic abnormalities in the standard leads were accompanied by such unequivocal clinical and laboratory findings that the diagnosis of infarct was made from the very onset. Later, a series of chest leads not only proved the existence of an infarct, but also throw some light on its possible location.

#### Case Report

The patient, L. S, is a 48-year-old hospital employee whose family history reveals the death of his mother and one of his brothers of pulmonary tuber He suffered pneumonia when two years old and a right upper cervical gland absects at four the time he was ten years old he also had had chicken pox and measles. He grew very fast, was gracile and easily fatigued. At cloven he had chorea minor of two months' duration and 'flu when eighteen. A year later he joined the merchant marine and was discharged after almost four years service for bronchitis. Since that time he has been susceptible to colds and has had three attacks of grippe.

In January 1945 he called on the writer complain ing in vague terms of easy fatigability and general He appeared to be a robust man & feet, 11 inches tall, and weighed 205 pounds. On exami nation, the lungs were clear and the heart was not enlarged, but on auscultation a soft systolic murmur was heard at the apex, evidently a residual of the chorca. His blood pressure was 180/90. He was advised to lose some weight.

Six months later he again complained of pain in his calves Otherwise, he felt all right and had lost 20 pounds his blood pressure was 170/80 his blood sugar was 90 mg per cent. He was advised to

increase his sugar intake.

On January 2 1046 he was hospitalized for an upper respiratory infection, and with sulfa medication recovered in about a week. About ten days after his discharge he complained of being 'all in and of tightness in his chest, restlessness and in somnia An electrocardiogram was taken on Janu ary 22 1046 (Fig. 1) which revealed a deep Q, and a diphasic T, interpreted as possible readuals of an carlier undiagnosed coronary occlusion. The com plaints had some neurotic coloring but the presence of coronary disease was duly considered Sedatives were given.

On January 23 1046, this patient again returned now with the complaint of malaise and difficulty in swallowing. His temperature was 100 F., and on examination a fairly large bulging of the left pharyn-geal wall was found, without any ovidence of fluc tuation Sulfa medication was immediately started and in the evening his temperature rose to 103 F However he made an uneventful recovery in five

days.

Hardly a week had passed when the patient telephoned that for the last two nights be had experi enced distress in his chest, difficulty in breathing, cold perspiration, and anxiety He was advised to outer the hospital, which he did the next morning In the hospital (February 5 1946) examination

revealed dyspnea, slight cyanosis congestion of the base of the lungs, enlargement of the heart and harsh, diffuse systolic murmur loudest over the pulmonary ares. The blood pressure was 158/96, the temperature was 99 6 F the pulse rate 96, the rhythm was regular the respiratory rate was He received emergency treatment for coronary occlusion with signs of decompensation.

The laboratory findings were urinalysis, negative the blood showed a hemoglobin of 70 9 per cent, red cell count 4.08 million, white cell count 15,050 with 76 per cent polymorphonuclears the sedimentation rate (Westergren method) was 6.22 48-64 in an hour, the nonprotein nitrogen was 24.8 mg per cent, the sugar was 82 6 mg per cent the Wassermann was negative. An electrocardiogram, taken in the afternoon showed changes in the Q wave in the third lead its voltage increased from two and a half millivolts to 5 millivolts. The T wave in the third lead was still diphasic, and it was expected to undergo characteristic changes within hours (Fig. 2) Retinal examination was negative.

During the day his condition did not show much change. He breathed with considerable difficulty was tired, and occasionally coughed up thick mucus. Toward evening his face, hands and feet became pufly and edematous. The temperature was 100 F Ho still had a tight feeling in his chest. At 2 A M (February 6 1046) he had an attack of severe precordial pain radiating toward his left shoulder increased dyspines cyanoels, and cold perspiration.
The next twenty four hours were characterized by exhaustion and dull pain in his left chest. The tem perature was 100 6 F pulse rate 86 respiratory rate 24 blood pressure 100/110 The sedimentation rate went up to 75 mm. in an hour The white cell count was 13 300 with 75 per cent polymorphonu The white cell clears.

The next day he was essentially the same except that does of ammophy llin increased his diuresis and he was less dyspneic. The temperature was 100.8 F During the night however the precordial pain became so severe that opiates again were necessary On February 8 he was comparatively quiet, but on the minth the chest pain and dyspines increased and blood-tinged sputum appeared. That night the patient again had an attack, during which the respir

بمعتونة أعر

Fra 1

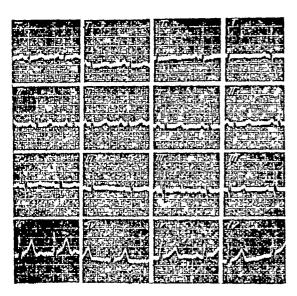

Fig 3

atory rate was 40, irregular, much anxiety was experienced The following day the sputum was

still blood-tinged

On February 11 an urinalysis revealed three plus albumin, many erythrocytes, and a few granular casts. The white cell count was 22,500, and the sedimentation rate was 94 mm in an hour. No doubt renal infarcts, possibly due to emboli, were completing the picture. From that time on the patient's clinical condition gradually improved and after eight weeks of hospitalization, he was discharged on April 2, 1946. His blood pressure, which also gradually diminished was 116/80 on that day. But, while he improved clinically, the laboratory findings were for a long time abnormal.

Between February 15 and March 29, six white cell counts were done, gradually decreasing from 13,400 to 6,600 During the same period seven sedimentation rates showed a decrease from 55 mm to 38 mm in an hour. Also, seven urinallyses revealed a specific gravity between 1,020 and 1,025, occasional albumin was present and, in the sediment, a few red cells, epithelial cells, hyalin, and epithelial casts were always present. On March 28, an x-ray of his chest showed no enlargement of the heart and the lungs were negative. Twenty-five days after his discharge the sedimentation rate was still 27 mm and there was albumin and a few hyalin casts in the urine. On May 23, finally, the urine was negative, the white cell count was 7,100 with 64 per cent polymorphonuclears, and the sedimentation rate was 14 mm

The electrocardiographic tracings taken during the illness, the convalescence, and after his discharge, at a 10-milly olf standardization, showed the

following

An electrocardiogram taken February 6 was, in all particulars, equal to the one in Fig 2. The day after, the tracing revealed an increased voltage of Q<sub>1</sub>—it was 6 milivolts—and T<sub>4</sub> showed some tendency toward elongation. There were no further changes on February 9, the fourth day of hospitalization and the day of his third attack. On February 11, however, changes, though not the expected ones, occurred. There was a slight depression of the ST<sub>1</sub> segment and a slight, elevation of ST<sub>4</sub>, both already noticeable on the previous tracing, a flattening of T<sub>2</sub> and the deepest Q<sub>2</sub> ever registered in this case

it was 9 millivolts. Two days later the tracing showed a flattening T<sub>1</sub>, a deep S<sub>1</sub>, while Q<sub>2</sub> was only 6 millivolts. On February 16 T<sub>1</sub> appeared only as a tiny elevation, while Q<sub>3</sub> regressed to 4 millivolts (Fig. 3)

Then, no remarkable changes occurred in the following four electrocardiograms, taken during the rest of his stay in the hospital, except for a more evident T<sub>1</sub> and some fluctuation in the voltage of Q<sub>1</sub> be-

tween 4 and 5 millivolts

On April 2 the patient was discharged and went away for a vacation. He returned for a check-up on April 24, at which time his electrocardiogram showed a fairly good T<sub>1</sub>, a diphasic T<sub>3</sub>, resembling the first tracing in Fig. 1, but it still showed a quite prominent Q<sub>3</sub> of 5 millivolts. A check-up a month later resulted in the same pattern. After he had worked for another month, with some fleeting sensation of chest distress, an electrocardiogram was taken on June 20, which showed a flat T<sub>1</sub>, while Q<sub>4</sub> and T<sub>4</sub> were exactly the same as in Fig. 1

Of course there was never any doubt in the writer's mind that this patient suffered one, or even two, coronary occlusions during his recent illness, and he expected the development of changes characteristic of a posterior and an anterior wall infarct. When these electrocardiographic changes did not occur, he thought, no doubt somewhat late, to investigate

possible other localizations of the infarct

On July 30 an electrocardiogram of standard leads plus chest series was taken. The patient had been working then for almost three months and for the last month had been completely symptom-free The chest series consists of seven leads, the first being at the fourth interspace on the right sternal margin, the last at the intersection of the posterior axillary line and a horozintal line drawn from the CF<sub>2</sub> position. Then five high chest leads were taken on a horizontal line starting at the CF<sub>2</sub> position and going to the posterior axillary line. These five high chest leads correspond, on a longitudinal plane, to CF<sub>3</sub> through CF<sub>7</sub>

In Fig 4 the standard leads show a completely upright T<sub>1</sub>, Q<sub>2</sub> is 4 millivolts, T<sub>3</sub> is diphasic, as in Fig 1 In the chest leads CF<sup>1</sup> <sup>2</sup> show a large upright T wave In CF<sup>4</sup> the T wave is upright, but less large, in CF<sub>6</sub> the T wave is barely visible and in

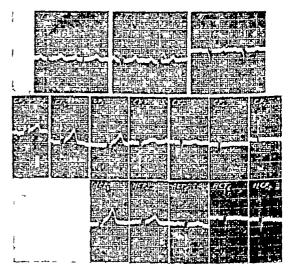

Fig 4

CF, the T wave is flat and sometimes almost inverted In the high chest leads the HCF, has a very large T wave, in HCF, the T wave is less large. In HCF, the T wave is upright but small, and in HCF, the T is slightly inverted

#### Conclusion

This patient presented a clinical picture of acute coronary occlusion and yet on the four standard electrocardiographic tracings he had only nonspecific abnormalities of which the most remarkable was the steadily increasing voltage of Q<sub>i</sub>, to a point where it was 9 millivolts while the largest deflection of that particular tracing was an R<sub>1</sub> of 23 millivolts (Fig. 3) The writers expectation was that of an at least late inversion of T<sub>2</sub>, though at times the minimal changes of T<sub>1</sub> made him think of anterior wall involvement. It was also suspected that the infarct might be in the interventricular septum, however in that cose interventricular conduction defects should have appeared

It is most unfortunate that chest lead series were taken only seven months after the attack and so the deep T inversions were missed however those T

wave inversions which were observed in the high chest leads of the axillary region appear to the writer typical evidences of infarction although they appear in a recovery stage and, at a time when all signs of abnormalities in the standard leads returned to preinfarction stage.

As far as localization is concerned it is felt that the infarct was in the basal region of the left ventricle states well.

This patient also suffered renal infarctions which most likely were due to embol. It is possible that the blood tinged sputims were due to pulmonary embolism of which the mechanism would be obscure

#### Summary

The clinical course of a typical myocardial infaret is reported with nonspecific abnormalities in the standard electrocardiograms outstanding of which was an exaggerated Q deflection. Later chest lead series localized the infarct in the basal region of the left ventricles lateral wall. The patient suffered renal embolism and possible pulmonary infarction.

#### PREVENTIVE PSYCHIATRY VIEWED REALISTICALLY

Fundamental changes in attitudes, which can come only from within the medical profession itself are vitally needed in the field of preventive peychiatry, according to Dr. Ralph M. Kaufman chief psychiatrist Mount Sinai Hospital, New York City Bpeaking at the recent Institute on Public Health.

Speaking at the recent Institute on Public Health of the New York Academy of Medicine Dr Kauf man spotlighted "realties" in proventive psychiatry from the standpoint of "The Adult. He focused on the need for a revamping of fundamental medical education—not in terms of increasing the number of bours for psychiatry as such, but in opportunity for centegration of the psychologic with the somatic an ideal and practical medical curriculum which would lead to the graduation of dectors willing and able to practice comprehensive medicine would be one of the most valuable contributions which could be made in the fold of preventive psychiatry psychiatry.

be made in the field of preventive psychiatry.
He underscored the dearth of facilities for psychiatric treatment and the tremendous need for
training of additional social workers and psychologate who will participate within their functional
limits in treatment programs. He recommended

that every general hospital, regardless of its sate have a psychiatric department not only for diagnosis evaluation, and treatment of frank psychiatric problems, but also to act as a center within the hospital for the education of all other staff members and personnel in the recognition of the importance of psychologic factors in all illness.

Looking at realities from the standpoint of "The Adolescent, Dr Milton J Senn, associate professor of pediatries in psychiatry, Cornell University Medical College said that one who focuses infant care practices soon comes to the realisation that attempts toward prevention and correction must be directed toward work not with the infant or young child but with his parents. Education of anyone clse, he said will be most productive of opportunities are provided when the persons to be taight are most receptive to learning about parent hood. Such an interest comes naturally in addlescence Education and guidance of the adolescent offers real and practical opportunities for prevention in psychiatry —Health News June 2 1847

Every Sunday the papers contain articles telling all sorts of ways to prolong life. They seem to forget the year of keeping away from the front of automobiles and the rear of mules and the need of leaving 'unloaded pistols ngidly alone. They all

agree that kissing is unhealthy, but did you over know a couple to kiss for their health? Of course it is true that a man can catch things from kissing notably matrimony—Da Costa Clinical Medicine June 1947.

# MULTIPLE, PROGRESSIVE, ACUTE ARTERIAL OCCLUSION, ASSOCIATED WITH HYPERTHYROIDISM AND DIABETES MELLITUS

HERMAN B ZURROW, M.D., and GAMLIEL SALAND, M.D., New York City

(From the Medical Service of the Bronx Hospital)

THE simultaneous occurrence of severe peripheral arterial disease, hyperthyroidism, and diabetes mellitus cannot be as rare as we may infer from the paucity of such reports in the literature. The following case demonstrates the almost inevitable consequences resulting in tissues whose metabolism has been raised to abnormal levels, while an impoverished blood supply fails to deliver the essentials necessary to maintain that metabolism. The increase in tempo of the development of gangrene in this case is sufficient to justify the adjective, malignant.

# Case Report

MS, admitted April 17, 1940, 44 years old, a European émigré, was, according to his own statement, very well until the onset of his present illness Close questioning, however, disclosed that for the past year and a half, the patient had noted some irritability and fatigue on slight exertion. There had also been a gradual loss of weight of approximately twenty pounds, an excessive thirst, an increase in urinary output, and excessive perspiration even without exertion or evposure to warm environment. There were absolutely no symptoms of intermittent claudication, rest pain, coldness, paresthesias, or color changes of the extremities.

Five days before hospitalization, the patient had been suddenly awakened by a severe pain in the right foot and toes. An attempt to stand and walk produced even more pain, and, in addition, blanching of the foot. He had been treated at home with sedatives and bed rest until glucosuria had been discovered, whereupon he had been hospitalized.

On admission, he had a slight pyrevia, a pulse rate of 110, a hot, moist skin, a fine tremor of the hands His eyes had a definite stare, the palpebral fissures were wide, winking was infrequent, hid lag was present, well-marked arcus senilis existed, the pupils reacted promptly The thyroid lobes were moderately enlarged but neither a thrill nor a bruit The heart was enlarged downward and to the left, sinus tachycardia was present, the sounds were of good quality, a soft apical systolic murmur was heard, the aortic second sound was loud, the blood pressure was 190/80, the lungs were normal, the abdomen was normal. The right lower extremity was cold from the ankle down, and was pale except for two small areas on the dorsolateral surface of the foot, and the fourth and fifth toes, which were cyanotic There was no loss of toes, which were cyanotic There was no loss of motion in the ankle or toes, and sensation was intact. The right femoral, popliteal, and posterior tibial arteries were palpable, and graded 4+ for patency. The right dorsalis pedis pulsation was not been applied to the patency. patency The right dorsalis pedis puisation in a felt. The left lower extremity was normal, all arterial pulsations were palpable and graded 4+ for patency. The admission diagnosis was exophthalmic goiter, diabetes mellitus, and acute arterial occlusion in the right leg, below the bifurcation of the

It was concluded that the occlusion was thrombotic in character since there was no likely source of

-

origin of an embolus Blood dyscrasia was ruled out as an etiologic factor for thrombosis. Serum coagulability was normal

The patient was placed on routine therapy for thyroid intoxication, diabetes mellitus, and arterial occlusion, including elevation of the head of the bed, heat to the upper extremities to produce reflex vasodilatation in the extremities, antispasmodics, including whisky, intravenous papaverin HCl, a paravertebral block of the first, second, and third, right lumbar sympathetic ganglia, pavex therapy, and protection of the limb by cradle and soft wrapping

Laboratory findings included a fasting sugar of 222 mg per 100 cc blood, 1 5 per cent sugar in a twentyfour hour urine specimen, a 2+ acetone A basal metabolic rate was +84 Wassermann and Kahn metabolic rate was +84 tests were negative Urea nitrogen was 154 mg Uric acid was 6 1 mg Creatinine was 1 37 combining power, three days after admission, was 54 8 Prothrombin time on admission was 86 per Serum coagulability test (Nygaard and Brown) was 200 seconds Bleeding time was one and one-half minutes, coagulation time was six minutes Blood count gave 94 per cent hemoglobin, 4,900,000 red blood count, 13,300 white blood count, 76 per cent polymorphonuclears, 23 per cent lymphocytes, 1 per cent monocytes Blood culture was negative after one hundred and forty-four hours Electrocardiogram confirmed sinus tachycardia and disclosed a notched T<sub>2</sub> and diphasic T<sub>4</sub> Roentgen examination of the chest disclosed no abnormality of the heart and lungs and no evidence of substernal thyroid enlargement Roentgen examination of upper and lower extremities disclosed no calcufer-tion of blood vessels The paravertebral block re-sulted in a rise of 0 6 C in the skin of the dorsum of the right big toe

On the afternoon of the second hospital day, the right posterior tibial artery pulsation could not be palpated. In three days the diabetes was adequately controlled. The patient was taking Lugol's solution and was comfortable. On the morning of the third day, the patient experienced a sudden, severe pain in the left big toe and foot, entirely similar to that experienced in the right a week before. Examination disclosed absent pulsation in the left dorsalis pedis artery, and diminished pulsation in the left posterior tibial artery, but normal pulsation in the populteal and femoral arteries, coldness and pallor of the toes and foot were present. A diagnosis of acute arterial occlusion due to thrombosis in the arteries below the populteal bifurcation in the left leg was made. A left paravertebral block of the first, second, and third lumbar sympathetic ganglia was performed, and pavex therapy started on the left leg. The following day no pulsations were palpated in the left posterior tibial artery.

The course of the patient's illness now became stormy. Despite therapy, gangrene developed and spread rapidly in both lower extremities. By the end of the third hospital week, it extended from the toes to four inches below the knees on both sides. Thereafter, it spread more slowly until the patient died seven days later. The diabetes was controlled

Both poplit

for the first two weeks of hospitalization. At that time the patient experienced a thyroid storm. Thereafter the diabetes became uncontrollable Surgery was not attempted because of the poor condition of the patient. Roontgen therapy to the thyroid could not be given successfully because of disorientation and lack of cooperation of the patient. Lugol's solution and quinine failed to affect the thyrotexicosis. The patients condition deterior ated rapidly. He formed a pitiable picture sitting with his gangrenous limbs in tallor fashion tearing off whatever wrappings were placed on the limbs constantly moving his body muttering, his ever stang out of a cadaverous face. Finally be lapsed into come and died thry days after hospitalization

The postmortem findings were as follows The

cal arteries were thickened and a section contained

femoral arteries were grossly normal

thrombi which completely occluded the vessels section, the thrombi were firm and reddish-vellow and extruded below the popliteal bifurcation into the tiblal artieries. The posterior tilhal arteries were occluded by thrombi from the bifurcation to their termination The anterior tibial arteries were not occluded The veins were normal Microsconi cally, the right popliteal artery disclosed advanced sclerotic changes there was splitting of the internal elastica The left poplitenl artery showed marked subintimal proliferation with some irregularity in the internal elastica, and some fraying and reduplica-tion there was considerable medial degeneration. The left posterior tibial artery showed some sub-intimal proliferation the remainder of the vessel wall appeared normal. This was also true in the right posterior tibial artery. The right antenor right posterior tibial artery. The right anterior tibial artery showed marked fraging and reduplica tion of the internal elastica. Grossly and micro-scopically the heart was normal. The aorta was the scat of moderate atherosclerosis. The thy rold was fibrotic, reddish yellow on section, homogeneous, and firm Microscopically the acini were well filled with colloid except in scattered areas where they were devoid of colloid or contained material that did not stain that did not stain Grossly the pancreas was nor mal, but microscopically there was seen a fine dif fuse interstitial edems with some fibrosis. Many of the isles of Langerhans seemed atrophic. The spleen was enlarged, and microscopically an unusual degree of reticular cell hyperplasia was seen. The liver was the seat of congestion and cloudy swelling. The kidneys were normal. The lungs were normal The esophagus and stomach were normal Meckel a diverticulum was demonstrated as well as two jojunal intussuceptions. The bladder mucoes had several hemorrhagic areas. The anatomic diagnosis was bilateral dry gangrene of both lower extremuties, thrombosis of both poplitical and posterior tibual arteriors, fibrotic thyroid, arteriorederosi of the aorta, Meckel's diverticulum, two jojunal intussusceptions hemorrhagic cystitis and pul monary edema

#### Comments

This case provokes speculation The relationship between arteriosclerosis obliterans and diabetes mellitus is well known. Arteriosclerosis obliterans occurs more frequenth and at an earlier age in diabetics. Gangrene is usually precipitated by infection to which the diabetic is so prone and the spread of gangrene is notably influenced by the extent and severity of the infection and the state of the arterial supply. In this case infection was not present.

What role did thyrotoxicous play in relation to the diabetes and arteriosclerosis obliterans in this case? The pathology in the affected arteries appears sufficient to account for the thromboes under ordinary circumstances, but the tempo of the spread of gan grene seemed excessively rapid and wo were at a loss to explain this phenomenon. We have watched the development of gangrone in many instances but in occase had we seen such rapid death of tissue. The question then arose as to what caused this rapid spread and what relationship the hyperthyroid state had to this increased tempo.

It is a known fact that metabolism of tissue is increased in the hyperthyroid state and that increased metabolic demand of necessity requires increased blood supply to tissues. In a patient with already diminished blood supply due to the arteroscierous such an increased demand for blood would certainly not be met. It is conceivable therefore, that cells would die if this increased blood supply would not be delivered and endothelial tissue is as susceptible as any other tissue. Under such conditions death of endothelial tissue would hasten the tendency to thrombosis formation and the more rapid development of gaugrene

#### Summary

A case of acute arterial occlusion in both lower extremitics is presented, in association with diabetes mellitus, arteriosclerosis obliterans, and thyrotoxcosis. It is suggested that the hyperthyroid state increased the tempo of the pathologic process to justify the description of malignant gangrone.

36 West SOTH STREET

## ANNUITIES FOR PHYSICIANS

The physician generally makes a comfortable in come, brings up his family, but provides very little for his declining years. This is painfully and in creatingly evident under our present tax situation which permits the physician seanty opportunity to save. In most corporations, pension systems have been set up for the protection of their employues when they reach the unproductive years. The money so invested is deductible on the part of the corporation. We apparently have no such escape for money so set aside, even if we use it to buy an annuity. The chairman of our Committee on Public Relations has been studying this problem for

the past year Even if we cannot persuade our Washington legislators to write in a deduction for annulties for physicians and others in similar circumstances, many of us feel that in any case the Society should endeavor to work out a group annuity program for its members such as might be available at a lower rate than one could obtain as an individual Such a project if successful, might become a major item in the economic program of your County beceiv

# WHAT THE NONPROFIT MEDICAL CARE PLAN MEANS TO THE DOCTOR AND THE PUBLIC

GEORGE P FARRELL, New York City

(Director, Bureau of Medical Care Insurance, Medical Society of the State of New York)

IN ORDER to evaluate the benefits of a voluntary nonprofit medical care plan to the doctor and the public, certain basic principles must be considered

The choice rests with the subscriber to voluntarily protect himself and his dependents against unpredictable catastrophic costs of medical care. The plan provides free choice of physician, it guarantees that no restriction is placed on the doctor-patient relationship, it provides liberal benefits consistent with sound underwriting practices on a nonprofit basis, it eliminates any third party interference in the administration or benefits offered. The term "benefits" means cash paid by a plan to a participating doctor for services rendered a subscriber and dependents.

In a short period of time evolutionary changes have taken place in the distribution of medical care costs through the facilities of medical care In 1940 only a few were in operation but at the present time throughout the United States there are approximately eighty plans sponsored by county and state medical societies and covering about five nullion people There are only two states which have no plan or one in the process of formation The acceptance by the public of the benefits offered through nonprofit voluntary medical care plans, since their inception, is evidence that the average citizen, who finds it difficult to meet unexpected and unpredictable medical care costs, has found a means to protect himself and his family

Six plans sponsored by county and state medical societies with a membership of more than 700,000 are now operating in New York State. The increase in membership during 1946 exceeded 329,000 or 122 per cent over all previous enrollment. It is reasonable to assume that membership during 1947 will increase to a million in New York State and benefits will exceed \$3,500,000.

With over 15,000 physicians throughout the state participating in the plans, the doctor-patient relationship is maintained. That relationship is a very personal one, based not only on trust in professional ability, but on many psychologic factors of intangible value to the well-being and recovery of the patient. You can choose

Presented by invitation at the 141st Annual Meeting of the Medical Society of the State of New York Buffalo May 9 1947 General Sessions your doctor on this time-honored American system, and I choose mine, a privilege which cannot be denied or interferred with in the practice of good medical care. This has been a contributing factor in making us the healthiest nation in the world.

Under the proposed National Compulsory Insurance Plan, it is certain that controls would be necessary, both as to the manner in which the physician could practice and the conditions under which the people could avail themselves of medical services How far-reaching these controls would be has not been clarified that the Surgeon-General would administer the program under the supervision and direction of the Federal Security Administrator controls which are set up under such a national compulsory plan will alter or destroy the doctorpatient relationship as we know it today patient will be taxed for a service whether he uses it or not, and if the choice of his own physician is desirable, he may often also pay privately for his services In all countries where the doctorpatient relationship has been destroyed, either wholly or in part under compulsory programs, the costs of medical care have consistently increased and the quality has deteriorated

The plans now in operation provide to the subscriber liberal benefits for premiums charged, and, as experience warrants it, benefits are increased consistent with sound underwriting practices

In New York State during 1946 the subscriber and members of his family used the services of a doctor on more than 95,000 occasions, for which benefits were received in excess of \$2,000,000 These benefits represented payment by the plan to the physician for medical care rendered They were equivalent to 1,000,000 office calls at \$2.00 per call, 40,000 tonsillectomies at \$50, or 20,000 appendectomies at \$100

The plans make it possible for the subscriber to budget for unpredictable medical costs in advance and future income need not be mortgaged to pay for catastrophic illnesses

The physician is guaranteed payment of his bills according to an indemnity schedule agreed upon. This amount is used as a credit toward his regular fee, if it is greater than the indemnity allowance, for subscribers who do not qualify for service benefits. There is no additional charge

to subscribers who qualify for benefits under a service contract

Service contracts are available in some plans for the individual subscriber whose income is not in excess of \$1,800, while other plans provide service benefits where the individual income does not exceed \$2 000. The subscriber with one family member is eligible for service benefits where his income does not exceed \$2 500, and a subscriber with a family whose income does not exceed \$3 500

Medical care plan benefits can be retained by the subscriber in the event he changes his place of employment or is unemployed. Thus is a definite advantage Reciprocity privileges are also available in the event the subscriber changes his residence to an area served by another plan

The medical profession has met the need of the public to budget for medical care by providing a nonprofit plan in which the public may enroll on a voluntary basis have free choice of phy sician with no third party interference, and receive liberal benefits

#### SPECIALIZATION IN SURGERY

During the past decade there has been an in creasing tendency for specialization in all branches of medicine. Several explanations are apparent. Medical progress has been so rapid that it has become practically impossible for a single individual to keep up to date in all recent developments Per haps the possibility of lucrative financial return has influenced some to enter special fields and finally the public has learned to think in terms of specialists and to domand them when they seek medical care

The trend toward specialization has been par ticularly evident in the field of surgery. The American College of Surgeons and the Surgical Boards have maintained high standards and proscribed the minimum requirements of training for those who desire recognition as specialists There can be no question that the activities of the various specialty boards have raised the standards of patient care.

It should be emphasized, however that the specialty boards have made it clear that they are exam lning boards. The diplomates of the boards are not to be regarded as members of a union or a guild

who may do surgery to the exclusion of others.

It is safe to state that personal integrity cannot be evaluated accurately by any board. The variety be evaluated accurately by any board of cases and types of operations the surgeon under takes are his personal problem. The size and location of each community will influence the activi tles of individual practices.

Few surgeons have the opportunities of self improvement which will make it possible for them to excel in all fields of surgery. Moreover the public has demanded selective activity and sometimes the surgeon is labeled a golter specialist, a rectal specialist, a stomach specialist, or some other kind of specialist not by choice but because his work

is outstanding A broad general surgical back ground is essential to all surgeons

In generations past it was easy to find a surgeon who, on the same day would remove hemorrhoids tonsils, gallbladder and thyroid perform a colon operation operate upon a stomach and perhaps remove a uterus for good measure Such diver sified activities are now rarely necessary or advis-

The modern surgeon is not a manual laborer whose task ends and begins with the operation itself Surgical diagnosis and strict attention to preoporative preparation and postoperative care have become equally important to technical ability Buttonhole incisions and slap-dash, speedy operating have been replaced by careful dissections with the emphasis on the gentle handling of tissues and not

get in and out fast. Familiarity with physiology bacteriology, path ology and biochemistry influences not only the preoperative and postoperative program but the con duct of the anatomic dissection Perhaps the science of surgery is approaching the art of surgery

Few mourn the passing of the universal specialist but perhaps he is more desirable than the surgeon whose hands can only obey his brain in an area circumscribed by a mental-anatomic boundary Who then shall perform this or that operation? Where should the line of specialization be drawn?

Those who accept the grave responsibility of the care of the sick and injured should ask themselves is there available for this problem a surgeon better qualified than I? Reference and acceptance of a patient under these circumstances will bring to the public the real benefits of specialization and none of its handicape.—Brian Blades M. D. Medical Annals of the District of Columbia June 1947

CONTRIBUTION OF \$25 000 00 FOR RESEARCH ON MULTIPLE SCLEROSIS INITIAL GOAL OF \$100 000 00 MET

A contribution of \$25 000 made by Mrs. Percy S

Straus was announced in July by the Association for Advancement of Research on Multiple Sciences The organization further stated that with this

contribution an initial goal of \$100 000 for research on multiple sclerosis has been met

Mr Ralph I Straus a recent addition to the Board of Directors of AARMS, in presenting the contribution on behalf of his mother stated that although he had been familiar with the disease because of its appearance in a member of his family only recently had he become aware that it is one of the most prevalent of ne

# THE FAMILY DOCTOR

By NORMAN ROCKWELL

(Reprinted through the Courtesy of The Saturday Evening Post, Copyright, 1947, The Curtis Publishing Company)

The above painting appeared in color in a recent issue of the Saturday Evening Post—Its painter, Mr Norman Rockwell, is well known as a portrayer of realistic American life—Thus, he has included in his Americana the one man who since its beginning has been an integral part of that American life. The Journal feels that Mr Rockwell has done medicine a great honor in portraying so accurately the true service a family doctor gives to his patients, and we are happy to be able to reproduce his painting

The real service of the family doctor which is vividly shown in the painting is that the doctor is the family's friend. The family clearly shows its confidence in their doctor, and the doctor clearly shows his interest in his patients. That interest is an outgrowth of more than mere medical and scientific fact, it is an outgrowth of intimate knowledge of their mental as well as their physical ills. He knows that Jane, who has a weak heart, is over anxious about the baby because she was premature, and that for the good of both of them he must allay her fears, he knows that Bill, Sr., is a hard-working man, but with a small income because he had to leave school during the depression and never had the education he wanted, he sees that Bill, Jr., is alarmingly listless, but knows that Bill's team lost the football championship. All this knowledge means he can treat this family for their physical ills more intelligently, and, equally as important, that he can help them mentally

We know that America is proud of the tradition of the family doctor, and from its pride we feel that the American people will continue to defend this vital part of their lives For to lose it would mean that they would lose their lifelong friend—the family doctor

# PROSTHESES, 1876

In consideration of the plight of amputees of World War II and their difficulties with artificial limbs, it is interesting to read the catalogues of various artificial leg manufacturers of the period following the Civil War

The following is composed of excerpts from a catalogue called Mark's "Patent Artificial Limbs with India Rubber Hands and Feet," published in New York in 1876 It quotes from an article in Appleton's Journal, June 19, 1875 "Such improvements have been made in late

years that, in all but a sense of touch, an artificial leg performs the most important duties of a natural one, allowing the wearer to walk, run, or sit at ease, and to endure an astonishing degree of fatigue in an upright position — It is noiseless, and only an expert can detect it "

n detect it "
"A brevet major of United States Volunteers,
"A brevet major of United States Volunteers, "I who was cut in two during the war, writes, 'I walk six miles every day without a cane or other assistance' Another martyr of gunpowder declares, 'I am employed in a locomotive works, and with the aid of an artificial leg I am able to support a large family. Think of supporting a large family on an artificial leg, and dandling a baby on an artificial knee! And what a sermon and example it is to those who complain that they cannot afford to marry with even the two natural limbs at their service<sup>†</sup>

"Still another writes, 'With my artificial leg I have visited the Highlands and all the noteworthy scenery of Ireland, Wales, England, Germany, France, and Switzerland

"We imagine that the wearers of these artificial limbs grow attached to them as to a meerschaum pipe, and it occurs to us that there must be a large amount of satisfaction in taking one's leg off and rubbing it up and down in a fondling way Some connoissours have collections of legs—week-day legs, Sunday legs, dancing legs, and riding legs, each expressly made for a distinct purpose But this is vanity and leadeth only unto vexation of the

(Marks, according to his catalogue, was "commissioned by the Surgeon-General to furnish artificial limbs to Commissioned Officers, Soldiers and Seamen of the United States Army and Navy, free of charge to them, agreeable with all Acts of Congress relating thereto")—Army Medical Library News, July, 1947

# Morning Session

Tuesday May 6 1947

The session convened at 9 10 A.M

SPEAKER ANDRESEN The House will please come to order

Several Chairmen of Reference Committees have informed me that the members of their committees have not signed their reports. Will any members here who have not signed the report of their Reference Committees please stop outside and just go across the hall and sign those reports? It will only take a minute

I want to announce that the banquet will be held on Wednesday night Thoy are very antious to sell some tickets for that banquet They have not been selling very well, so please buy yours as soon as possible

Section 52 (See 19)

Introduction of Representatives of Other State Societies

SPEAKER ANDRESEN Vesterday we introduced delegates from other state societies and one was absent. He is an old friend of ours He ran our scientific programs for several years, and has done a great deal of work for our Society. However he has now abandoned New York and has gone to Vermont from which State Society he has been sent here as a delegate I will ask Dr. McKenna if he will escort to the platform Dr. D. Dexter Davis the delegate from Vermont.

There was applause as Dr Donald E McKenna escorted Dr D Dexter Davis to the plat form

DR. D DEXTIR DAVIS Mr Speaker and Members of the House of Delegates I am sorry that I am a little late in showing up to represent the State of Vermont, but I know you gentlemen will understand when I say that we just finished sugaring and that fishing opened the day before yesterday

I feel in coming back here like the old Vermont farmer who was met on the road just below my place It is a country road, and we have an expression up there that Vermont is where you find it. Well, this big automobile drove up to him and stopped, and the man driving the car looked out and said Can I get into Brattleboro if I continue right straight ahead on this road?

I don t know

If I go back to that fork that I just passed and take the other road can I get into Brattleboro? I don't know

By this time the city fellow was gotting quite mad so he said. For a fellow that lives up here you don't seem to know much about the place

The farmer said No but I ain t lost (Laughter)

So gentlemen, that is the way I feel in coming back to you It seems like being at home again

I bring you the greetings of the State of Vermont and was also authorized to tell you that if you want to forget the problems connected with medicine any time, just come up there and if you will contact any member of the Vermont State Medical Society we can show you where you can get plenty of fish and lots of maple syrup (Applause)

Section 58

Expression of Appreciation by Retiring Commissioner of Health

Speaker Andresen Our President Dr Bauer has an announcement to make.

PRESIDENT BAULE Mr Speaker I have a letter which I received from the Commissioner of Health and in which I thought the House would be inter cated. It is dated April 25 1947

Dear Doctor Bauer

On the eve of my retirement as State Commissioner of Health, I want to express to the Council my deep appreciation for the cordial support given by it to so much of the work of the Department during my incumbency. I am particularly

grateful to the Council Committee on Public Health and Education, the members of its several subcommittees, and to the officers of the Association who have so frequently given their time to meetings with representatives of the Department

The readiness of these busy practitioners to give freely of their informed advice on many different subjects affecting Department policies and medical practice is worthy of more generous reward than any words from me Yet since that reward than any words from me Yet since that is all I can give, I think you should know the high estimate I place upon the value of these meetings

I feel that I should especially mention Dr O W H Mitchell, under whose chairmanship the Committee has functioned during most of my commissionership His broad understanding, his wise guidance, and (shall I say?) ineffable diplomacy, have made for the free discussion of problems without the heat that so often provokes misunderstanding and needless dissension Due largely to his leadership, I think that there is a realization by the medical profession that the vast majority of modern fulltime health officers are well-educated physicians with special knowledge in their field, and an appreciation by public health officers that the vast majority of practitioners are sincere, solid citizens equipped for their profession and anxious for the betterment of mankind

Sincerely yours, /S/ Edward S Godfrey, Jr , Commissioner of Health

I thought that should be spread on our minutes

I have replied to it, and told him I agreed with everything he said about Dr Mitchell, but that I felt he was due a little praise himself for the way that he had cooperated, and his whole Department had, with the Society while he was Commissioner (Applause) Speaker Andresen

I am going to call now for any further resolutions We wish to get them in as soon as possible so we can refer them to reference committées

Section 54

Amendment to Bylaws Relating to Active Membership

DR EZRA A WOLFF, Queens I am instructed to introduce this amendment to the Bylaws which relates to Active Membership

It is proposed to amend the Bylaws, Section 1,

first sentence, to read

"The active members shall be Doctors of Medicine who are active members in good standing of the component county medical societies?

SPEAKER ANDRESEN That being an amendment to the Bylaws it has to be published, and it can then be voted on next year

Section 55 (See 106)

Medical Indemnity Plan-Genesee Valley Medical Care, Inc.

DR LEO F SIMPSON, Monroe This is a resolution introduced at the request of the Monroe County Medical Society

"The Medical Society of the County of Monroe requests the House of Delegates to endorse the Genesee Valley Medical Care, Inc., Rochester, New York "

Speaker Andresen Referred to the Reference Committee on Report of the Council, Part VII, Medical Care Insurance

(See 107) Section 56

Medical Indemnity Plan-Central New York Medical Plan, Inc

DR LEO E GIBSON, Onondaga This resolution 18 offered by the County of Onondaga Medical Society, and concerns a Medical Indemnity Plan

"The Medical Society of the County of Onondaga requests the House of Delegates to endorse the Central New York Medical Plan, Inc., Syra-cuse, New York."

Speaker Andresen Referred also to the Reference Committee on Report of the Council, Part VII. Medical Care Insurance

Are there any further resolutions?

There was no response

If there are, no further SPEAKER ANDRESEN resolutions to be introduced at this time, we will go on and hear some reports of Reference Committees Is there any reference committee ready to report?

Section 57 (Sec 10)

Report of Reference Committee on Report of Coun-Maternal and Child Welfare cıl-Part II

DR S B BURK, New York I think you can all relax for there is nothing controversial about this

Your Reference Committee carefully studied in detail Part II of the Report of the Council relating to Maternal and Child Welfare and observed that there were meetings of the Council Committee on Public Health and Education and the Subcommittees on Maternal Health and Child Welfare at the request of the Director of the EMIC Bureau of the New York State Department of Health, New York City, on June 12 and August 14, 1946, to consider the qualifications of physicians who requested specialist ratings in the EMIC program I move the adoption of this part of the report

The motion was seconded, and as there was

no discussion, it was put to a vote and was unani-

mously carried

The Reference Committee com-Burk mends highly the choice of physicians of the Medical Society of the State of New York following the communication on August 19, 1946, to act as advisers to the EMIC Bureau of the New York State Department of Health, in processing the applications from physicians requesting special rating in the EMIC program This was approved at the meeting of the Council in September, 1946 The Reference Committee takes notice of the wisdom of the statewide composition of this important advisory committee, who will act also in the Rehabilitation Program and any other activity for which the Department of Health desires such special service move the adoption of this part of the report

The motion was seconded, and as there was no discussion, it was put to a vote and was unani-

mously carried Dr Burk

DR BURK The usefulness of the Subcommittees on Maternal Health and Child Welfare was again emphasized by having the Chairman of each Committee present with members of the Subcommittee on Rehabilitation and also physicians of the Medical Society of the State of New York designated as advisers to the State Department of Health, plus officers of the Medical Society of the State of New York and representatives of the New York State York, and representatives of the New York State Department of Health at a meeting on September 11, 1946, to consider the qualifications of the physicians who requested specialists' rating We recommend an expression of appreciation for such untiring efforts when it is recorded that parts of the Com-mittees on Maternal Health and Child Welfare were also in session on the previous day I move the adoption of this part of the report

The motion was seconded, and as there was no discussion it was put to a vote and was upani

mously carried

Dr. Burk With continued and unceasing inter est, the Subcommittee on Maternal Welfare met with the Committee on Public Health and Educa tion in New York on November 12, 1946 to discuss the postgraduate education program with regard to holding regional maternal welfare days throughout the State At this meeting it was recommended that letters be sent to Regional Chairmen in Obstet rics (which was done) expressing the desire of the Committee that such meetings be held Such proressive activities call for special thanks of the House of Delegates and the Reference Committee makes this recommendation I move the adoption of this part of the report.

The motion was seconded, and as there was no discussion, it was put to a vote and was unani

mously carried

Dr Burk It also comes to the attention of the Reference Committee that the Chairman of the Subcommittee on Maternal Welfare attended meetings

of the Subcommittee on Rehabilitation

The Membership of the Subcommittee on Mater nal Welfare and the high calibre of Regional Chair men in Obstetrics also appears in the report Reference Committee has taken due notice thereof and wishes to express itself accordingly I move the adoption of this part of the report

The motion was seconded, and as there was no discussion, it was put to a vote and was unani-

mounly carried

Dr. Burk The Reference Committee recommends the approval of the further activities of the Subcommittee on Maternal Welfare when it met with the Council Committee on Public Health and Education at the request of the New York State Department of Health on April 9, 1947 to ductuss the development of a colored film library to be available in postgraduate instruction I move the adoption of this part of the report.

The motion was seconded and as there was no discussion it was put to a vote and was unani

mounly carried

Dr. Burk I now move the adoption of the report in its entirety relating to Maternal Welfare

The motion was seconded and as there was no discussion, it was put to a vote and was unanimously carried

Dr. Burk Concerning Child Welfare laudatory comment is made by your Reference Committee in connection with the various meetings of the Sub-committee on Child Welfare with the Committee on Public Health and Education which considered the qualification of physicians requesting specialists ratings in the E.M.I.C. Program. I move the adoption of this part of the report.

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously

carried

Dr. Burk The Chairman of the Subcommittee on Child Welfare at meetings of the Council Com mittee on Public Health and Education with the Subcommittee on Rohabilitation is a further expresmon of intensive activity which your Reference Committee recognises and wishes that this recognition be expressed to the House of Delegates I move that this part of the report be adopted

The motion was seconded and as there was no discussion, it was put to a vote and was unanimously

carried

While the general practitioner is not Dr. Burk often given the amount of recognition due the Subcommittee on Child Velfare held meetings on December 4 1946 and January 8 1947, to further consider the plan of the New York State Depart consider the plan of the New York State Depart ment for the establishment of 'Pediatric Institutes for General Practitioners The problem has not been sufficiently developed to receive the approval of the Committee on Child Welfare This praiseworthy project is to have the State divided into regions, with the Institute centered around the medical schools in the State The Reference Committee recommends a continuation of this study and requests the endorsement of the House of Delegates I move the adoption of this part of the report.

The motion was seconded, and as there was no discussion, the motion was put to a vote and was

unanimously carried

On January 8, 1947 the Subcom Dr. Burk mittee on Child Welfare discussed the use of the BCG Vaccine in New York State as part of the Tuberculosis Control Program The above Com mittee is of the opinion that an educational program be inaugurated to inform the medical profession of this State about BCG immunization. This im portant and very desirable project is recommended for your approval. I move the adoption of this part of the report
The motion was seconded, and as there was no

discussion it was put to a vote and was unanimously

Dr. Burk The importance of child welfare has been considered by your Subcommittee on Child The Reference Committee observes the outstanding ability of the Regional Chairman in Pediatrics (for regions comprising counties as shown in the list of Regional Chairmen of Obstetrics) which applies in this report. I move the adoption of this part of the report.

The motion was seconded and as there was no discussion it was put to a vote and was unanimously

carried

Dr. Burk I move the adoption of the report as it pertains to child welfare

The motion was seconded, and as there was no discussion it was put to a vote and was unanimously carried Dr. Burk I have just one more comment.

want to move the adoption of the Report of the Council Part II relating to Maternal and Child Welfare, which makes the matter all-inclusive.

The motion was seconded, and as there was no discussion it was put to a vote and was unanimously

carried Speaker Andresen Thank you very much Dr Burki

(See 11) Section 58

Report of Reference Committee on Report of the Council—Part IV Public Health and Education

DR. ABRAHAM KOPLOWITZ Kings I am afraid I will not have very many motions to make in the course of this report so I will just make the entire

report, as it can be considered as a whole.

This portion of the report of the Committee of Public Health and Education deals with the Subcommittees on Cancer Hard of Hearing and the Deaf Montal Hygione County Health Depart ments, Homologous Serum Jaundice, and BCG Immunization

The Subcommittee on Cancer, under the chairmanship of Ralph T Todd, met several times with the Public Health Committee, and some officers of the Society, and representatives of the State Department of Health for the purpose of integrating the work of several agencies, such as the State Division of the American Cancer Society and the State Department of Health Their resolution was adopted by the Council of the State Society

In February of this year plans were formulated for regular meetings of the State Department of Health, the Chairman of this committee, and the Chairman of the Subcommittee on Cancer A number of lectures and teaching days have been given in various

parts of the state

The Subcommittee on Hard of Hearing and the Deaf, under Dr G D Hoople, met with the Committee on Public Health and Education and representatives of the Departments of Health, Education and Welfare, and planned for the education and maintenance of hearing centers in strategic cities of In the near future all the main cities in the state

the state will have such centers

The State Society has received a communication from Dr W W Bauer of the American Medical Association relative to a resolution that was passed regarding the statewide mental hygiene program, and the Council of the State Society authorized a committee to study the matter This subcommittee is considering matters pertaining to the outpatient treatment of veterans with psychiatric disabilities, and has communicated with the Joint Legislative Committee of the state as to the need of research and treatment of cerebral palsy

The State Department of Health has requested the Committee on Public Health and Education to discuss the extension of the Public Health Program in the State, with particular emphasis on the health departments Dr Mitchell felt that this should be discussed by the Planning Committee of the State

At the request of the Assistant Commissioner of the State Health Department for Medical Administration, the Public Health Committee studied and approved a plan for the Department of Health to prepare a report form and a study of the incidence of homologous serum naundice in patients who have been transfused with dried blood plasma which the Department is distributing throughout the State The report form is to be approved by the Committee on Public Health and Education and will be sent to attending physicians for information about hepatitis and jaundice in anyone who has received injections of their plasma products. Such a form has been approved

The Committee on Public Health and Education, with the Committee on Child Welfare and representatives of the New York State Department of Health, met with the representatives of the nine medical schools of New York State, and after a thorough discussion recommended that an advisory committee be appointed by the New York State Department of Health and the State Medical Society to work out a plan whereby instruction would be available for those who are to be in charge of BCG immunization and for county medical societies, hospital staffs, and other medical groups This recommendation was approved by the Council of the Society

Your Reference Committee believes that the Council Committee on Public Health and Education

and its various subcommittees have done an excel lent 10b in these departments

I move the adoption of the report as a whole

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

The recommendation of the committee that it be disbanded and further inquiries answered by the

Secretary is approved

The work of the Council Committee on Liaison with the Veterans Administration has been noted There were no recommenda-The Reference Committee with commendation tions in the report recommends the continuation of this Committee

I move the adoption of the report

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

Section 60 (See 29)

Report of Reference Committee on Report of Council—Part VIII Equal Privileges for Returning Veterans (Treatment of Veterans)

DR LEO E GIBSON, Onondaga On the resolution introduced by Dr William Ostrow, of Kings, on the subject "Equal Privileges for Returning Veterans," and reading

"WHEREAS, a number of physicians, citizens of the United States, graduates from foreign medical schools, the majority of whom are members of the Medical Society of the State of New York, honorably served as commissioned officers in the armed forces, and

"WHEREAS, these veterans were licensed to practice medicine in the State of New York, and "WHEREAS, these veterans now find that the

Veterans Administration of the United States is not according them the same privileges to treat veterans as are accorded to the graduates of

American schools, be it "Resolved, that the House of Delegates go on record as favoring and urging the Veterans Administration to give these medical veterans the same status as is given to the veterans who graduated from American schools, and be it further "Resolved, that a copy of this resolution be

printed in the State Medical Journal and copies of this resolution be forwarded to the Coordinator of the Veterans Bureau in New York"

This resolution is disapproved as not being in agreement with facts presented to the Reference Committee by Dr Frederick E Lane, Director of the Outpatient Department of the Veterans Administra-tion in New York State I move the adoption of the recommendation of the Reference Committee

DR JOSEPH P HENRY, Monroe I second the

SPEAKER ANDRESEN You have before you the recommendation of the Reference Committee, which carries with it the disapproval of the resolu-Is there any discussion on the motion which is to adopt the recommendation of the Reference Committee?

DR ALFRED M HELLMAN, New York Would Dr Gibson please tell us in what way Dr Lane says this is not in accordance with the facts. From everything we have read in the state journals and other periodicals, that would not seem to be so would like to hear why Dr Lane says it is not in accordance with the facts

Dr. Gibson Dr Lane is here, and he can an-

swer that, if you so desire DR. HELLMAN We should have that information before we vote on this motion

Yes. Dr. Gibson If there is no objection on Speaker Andresen the part of the House, we could ask Dr Lane to present that. Is there any objection? Hearing none, we will ask Dr Lane to present that information to

us (Applause)
DR. FREDERICK E. LANZ The Veterans Administration under the Medical Care Plan does not have any differentiation between men who are heensed to practice in the State of New York. Their school of graduation is of no concern to us under the Medical Care Plan The only requirement is beense in the State of New York. That is

Statement No 1 Statement No. 2 is that the Professional Standards Board, of which I was the Chairman for the State of New York, did not have the power to approve for full-time or part-time employment by Veterans Administration graduates of schools other than Grade "A" Schools. Those applications had to be forwarded to Washington to our central office. Just as the graduate of our Grade "B Schools, let us say Middlesex, must have his application forwarded to Washington for action so graduates of foreign schools require the forwarding of their applications to Washington There was no differentiation as far as we were concerned between the schools, but it was necessary to send these papers to Washington first to have the approval of the schools We, in New York, have no record of the qualities and standards of the schools of the European universities.

Dr. ABRAHAM KOPLOWITZ Kings Your second statement does not seem to agree with the first. What do they do in Washington about this?

DR. LANE We have many men in our employ

We have many men in our employed who are graduates of foreign schools, which I think answers the question very pertinently SPEAKEN ANDRESHY Is there any further discussion? If not, thank you very much Dr Lane The question was called and the motion was

put to a vote and was carried to accept the recom mendation of the Reference Committee

Section 61 (See 34)

Report of Reference Committee on Report of Councll-Part VIII Veterans' Dues

Dr. Leo E. Gibson, Onondaga On the resolution introduced by Dr Exra A. Wolff of Queens, reading

WHEREAS, the House of Delegates has adopted the principle of modifying payment of dues by members of the Medical Society of the State of New York in active military service for the dura

tion of such service, and Wheneas, so-called terminal leave is included in the term of active service therefore be it

Resolved that the period of modified dues pay ment be calculated from the end not the beginning, of the 'terminal leave.'

This resolution is approved by the Reference

I move the adoption of this portion of the report

DR NELSON W STROHM, Erra I second the motion

There being no discussion the motion was put to a vote and was unanimously carried

Section 62 (See SO)

Report of the Reference Committee on Report of Council—Part VIII: Equal Privileges for Returning Veterans (Postgraduate Training)

Dr. Leo E Gibson Onondaga Reporting on the resolution presented by Dr William Ostrow, of Kings on Equal Privileges for Returning Veterans, read

"WHEREAS, a number of physicians, citizens of the United States, graduates from foreign medical schools, the majority of whom are members of the Medical Society of the State of New York, honor ably served as commissioned officers in the armed forces and

"WHEREAS, these veterans were licensed to practice medicine in the State of New York and

"Whereas, these veterans now find that they are denied the same opportunities for postgraduate study and training in accredited medical col-leges and hospitals as the graduates of American colleges, be it 'Resolved, that the House of Delegates go on

record as favoring that these veterans be accorded the same privileges to obtain postgraduate train ing as the graduates of American schools, and be

it further

Resolved that a copy of this resolution be printed in the State Medical Journal and copies of this resolution be forwarded to the colleges and hospitals giving poetgraduate instruction in the State of New York

This resolution was approved by your Reference Committee I move the adoption of this report. DR. WILLIAM KLEIN, Bronz I second the mo-

There being no discussion, the motion was

put to a vote and was unanimously carried

Section 63 (See 37)

Report of Reference Committee on Report of Council-Part VIII Medical Consultants in the Veterans Administration

Dr. Lzo E. Gibson Onondaga On the resolu-tion presented by Dr Benjamin M Bernstein of Kings, concerning Medical Consultants in the Veterans Administration, and reading

WHEREAS, the Veterans Administration has initiated a policy of appointing part-time medical consultants to supplement their own staff and

WHEREAS, these consultants are selected by committees of deans from medical schools, and WHEREAS, it is the policy of these deans to

select no consultants except those who are on the teaching staffs of medical schools, and

Witnessas, this policy discriminates against other qualified and competent specialists outside of medical schools and establishes an exclusive monopoly of veteran consultant care and

Whereas, this discriminatory practice of consultant selection deprives the veteran of some of the best medical skills, particularly by veteran physicians who held responsible positions during the war and best understand the problems of the

veteran therefore, be it

Resolved, that the Medical Society of the State
of New York go on record as being opposed to the present process of selection for consultant Veterans Administration medical specialists, and that the responsibility for consultant selection be placed in the hands of the Council Committee on Liaison with the Veterans Administration with the aid of the local county society and the present deans' committee"

This resolution is approved by your Reference Committee

I move the adoption of this portion of the report I second the DR NELSON W STROHM, Erre motion

SPEAKER ANDRESEN It has been regularly moved and seconded that the report of the Reference Committee, carrying with it the approval of the resolution, be adopted Is there any discussion?

SECRETARY ANDERTON May I move an amendment to the effect that the Secretary be instructed to send a copy of this resolution to each of the deans of the nine medical schools in New York State

DR JOHN L O'BRIEN, Bronx I second the

amendment

There being no discussion, the amendment was put to a vote and was unanimously carried

The amendment is carried SPEAKER ANDRESEN We now come to the original motion as amended Is there any discussion?

ASSISTANT SECRETARY FREY It would appear to me that in the whereases there is a good deal of If we are going to adopt this resolution I think we should amend the part that says that it is the practice of all deans to appoint only their own members of their staffs Do we know that? We might say, "It would appear to be so," or "in some

instances it has appeared to be so " Do you wish to make that SPEAKER ANDRESEN

amendment?

Assistant Secretary Frey Yes, I would offer that as an amendment

DR EUGENE H Coon, Nassau I second that

DR BENJAMIN M BERNSTEIN, Kings That is a Although I see no objection to the known fact amendment, it is a known fact that the consultants chosen by these deans consist of men on their own teaching staffs only

SPEAKER ANDRESEN Do you accept that as an

DR BERNSTEIN Yes, I have no objection to the

amendment

Speaker Andresen It may not be true in all instances, and this states it as being apparently so instead of making the absolute statement

Dr. Gibson Now I move to adopt the report of the Reference Committee as a whole, as amended

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

(There was an announcement by the Speaker concerning the banquet )

Section 64 (See 40)

Report of Reference Committee on Report of Council—Part VII Medical Indemnity Plan (Northeastern New York Medical Service, Inc.)

DR DENVER M VICKERS, Washington Your Reference Committee on Council Part VII, Medical Care Insurance reports as follows

In regard to the resolution introduced yesterday by the County of Albany your Reference Committee moves that the Northeastern New York Medical

Service, Inc be approved

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously

DR SAMUEL Z FREEDMAN, New York you give us in a few words generally what this company is to do? Does it correspond to the United Medical Service that we have in New York County?

Yes

DR VICKERS
DR FREEDMAN It is the same
DR VICKERS Yes
The Properties That is what I thought, but I wanted to make sure

Section 65 (See 13)

Report of Reference Committee on Report of Councıl—Part VII Medical Care Insurance

DR DENVER M VICKERS, Washington Your reference committee is pleased with the work of the Subcommittee of the Council on Medical Expense Insurance during the past year as one of the principal methods of combating the advance of state medicine It is hoped that the active work of the committee and of Mr George P Farrell, Director of the Bureau of Medical Care Insurance, can be extended during the years ahead

We approve the suggestion of the committee for continued study leading to a uniform contract on a

statewide basis

We approve of the recommendation of the committee in regard to standards of acceptance for approval of nonprofit voluntary medical care plans in New York State, which are as follows

Local Approval

Approval of the county medical societies in whose area it operates

In the event a county society does not approve a plan, a special committee of three members is to be appointed one by the plan, one by the county medical society, and one by the Medical Society of the State of New York, to investigate and study the reasons why approval was withheld

If it is the opinion of a majority of the committee, approval will be granted to the plan

after consideration

Professional Control

The Board of Trustees shall contain a majority of physicians

That these representatives shall be members of the Medical Society of the State of New

The medical profession is to assume responsibility for the medical services included in the benefits

Free Choice of Physician

There shall be no regulation which restricts the choice of a qualified doctor of medicine in the locality covered by the plan, who is willing to participate and render service under the conditions established

When care has been rendered by a nonparticipating physician and claim filed for such care, payment shall be made direct to the nonparticipating physician or to the subscriber upon

presentation of a receipted bill

Underwriting Subscriber premium rates should be adequate to provide for the benefits offered and the risks involved in the contract

[Continued on page 2022]

# WELL TOLERATED by the NEWBORN

Clinical experience establishes that CARTOSE\* is especially well toler ated by newborn infants.

CARTOSE supplies carefully bal anced amounts of non fermentable dextrins, with maltose and dextripse These offer the advantages of spaced absorption because of the time required for hydrolysis of the higher sugars; less likelihood of distress due to the presence of excessive amounts of fermentable sugars in the intestinal tract at one time.

CARTOSE 1s liquid formula preparation 1s simple rapid and ac curate It is compatible with any for mula base, fluid evaporated, or dried milk.

PThe word CARTOSE is negletered trademark of H.

H. W. KINNEY & SONS, INC.

(Kinney)

COLUMBUS INDIANA

## [Continued from page 2020]

2 Plan should be organized and operated to provide the greatest possible benefits in medical

care to the subscriber

All plans shall conform with state statutes as set up under the New York State Insurance Department with due consideration for earned premiums, administrative costs, and reserves for contingencies

Enrollment

Enrollment procedures shall be on a sound basis so as not to expose the plan to adverse

It is recommended that enrollment be offered to individuals at the earliest possible date that experience of the plan warrants

Descriptive folders and all promotional material wall state clearly and accurately the benefits offered by a plan, and also in the same manner, exclusions in the contract

Reports

All plans which have received approval, or are seeking the approval of the Medical Society of the State of New York, shall submit quarterly reports on forms provided for that purpose, to the Bureau of Medical Care Insurance of the Medical Society of the State of New York

SPEAKER ANDRESEN

Duration of Approval Approval by Medical Society of the State of New York shall be for a period of one year, at the end of which, review of all plans will be made by an appropriate committee of the Medical Society of the State of New York, to determine eligibility for renewal of approval

We move approval of this portion of the report DR A WILBUR DURYEE, New Yorl I second

It has been regularly

the motion

moved and seconded that this portion of the report Is there any discussion?

DR ABRAHAM KOPLOWITZ, Kings In the early part of the conditions of the Plan, where they specify that the majority of the Board of Trustees shall be physicians and members of the Medical Society of the State of New York, I would like to amend that to read instead of Board of Trustees "the governing body" Some might call it a Board of Directors and Some might call it a Board of Directors and at the same time have a Board of Trustees of which the majority of members may be doctors, while the controlling board may be more representative of lay people than of doctors and not be called the Board of Trustees Instead of "Board of Trustees" the term should be "Governing Body," whatever they happen to call it

DR SAMUEL Z FREEDMAN, New York I second

that amendment

Dr. Thomas M D'Angelo, Queens I am going to discuss this amendment I don't think it goes far enough by only having on the governing body a majority who are doctors and members of the State Society Those physicians should be recommended by the Medical Society of the State of New York That is a very, very important precaution because we can have representatives on that governing body who are members of the Medical Society of the State of New York yet who have not the viewpoint of organized medicine. Therefore, I feel that the majority of physicians on such governing body should be recommended by our State Society

DR HOMER J KNICKERBOCKER, Onlario

ond that amendment

DR HARRY ARANOW (Councillor) Point of in-

formation, Mr Chairman What I would like to know is, has this Reference Committee been empowered to set up rules and regulations for the organization of these insurance plans? This is a county matter, and ought to be studied carefully and worked out by men who are experienced in insur-I have no objection to this particular amendment, but it seems to me that the Reference Committee has nothing to do with setting up rules that will establish medical care insurance plans for the whole State of New York and that the counties must follow in organizing them

SPEAKER ANDRESEN The Reference Committee is simply discussing the suggestions that were made

by the Council
DR VICKERS That is right

And is recommending that SPEAKER ANDRESEN they be now adopted by this House

Dr. Aranow Is that on the report of the Coun-

SPEAKER ANDRESEN Yes, this is the Reference Committee on the Report of the Council, Part VII, Medical Care Insurance, that is reporting

DR VICKERS It provides that the plan must have the approval of the county medical societies in

whose area it operates

DR ARANOW I just wanted to make sure that was included I had overlooked that in the reading DR VICKERS It is in the first section headed "Local Approval"

DR KOPLOWITZ I will accept Dr D'Angelo's amendment to the amendment as part of the original amendment and save the necessity for taking an additional vote

SPEAKER ANDRESEN The amendment then is that a majority of the governing body shall be physicians who are members of the Medical Society of the State of New York and selected or approved

Dr. D'Angelo Recommended

Recommended by the SPEAKER ANDRESEN Medical Society of the State of New York.

The question on the amendment was called, and it was put to a vote and was unanimously carried, then the question on the motion as amended was called, and it was put to a vote and was unanimously carned

DR VICKERS I move the adoption of the report

as a whole, as amended

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carned

DR BENJAMIN M BERNSTEIN, Kings the State Society shall do the recommending? Who

is empowered to recommend and O K, these men?

SPEAKER ANDRESEN The motion has been carried, so I guess the State Society will have to work that out in some way

Section 66 (See 16)

Report of Reference Committee on Report of Council—Part XII Miscellaneous

Dr. Joseph A. Geis, Essex After careful study, we appreciate the amount of work done by the Coordinating Council on Nursing Problems We believe that your House of Delegates should urge the Coordinating Council to carry out the following recommendations

Explore the possibility of making Regents Scholarships available to nurses in training

Urge community and industrial groups to provide scholarships for nurses in training

[Continued on page 2024]

Candy and the

Cephalic Phase of Digestion

That the pleasant sense of satiety and satisfaction which follows a good meal is conducive to trouble free di gestion has been repeatedly experienced by everyone. The psychic influence of the sight and taste of attractive food upon the secretion of

the digestive juices and upon gastrointestinal motility is probably the basis for this observation. A meal which ends with a piece or two of candy is usually regarded as a satisfying meal. In this manner candy can rob even an ordinary meal of its drabness. Children look forward to this treat at the end of their meals, this very anticipation encourages them to eat their other foods more eagerly. And few indeed are the adults who do not enjoy a sweet after lunch-or dinner.

Candies are made with many wholesome and nutritionally valuable foods—milk, butter, eggs, fruits, and nuts. To the extent these foods are present, candies provide valuable protein, minerals, and B complex vita mins. Readily utilized caloric food energy is also supplied by candies.

COUNCIL ON CANDY OF THE

I move the adoption of this report

tinued representation

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR GEIS The report of the Council Committee on Medical Licensure shows considerable work and study We agree with the Council Committee in making the following recommendations

"(1) That citizenship as a requirement be incorporated in the Medical Practice Act,

"(2) In lieu of this, that an amendment similar to Article V, Section 2193, of the California Medical Practice Act be introduced. This is in addition to other accepted requirements that we now have in our Medical Practice Act and would be added to alleviate some of the difficulties we have encountered with foreign licensure.

""If the applicant is not a citizen of the

"If the applicant is not a citizen of the United States, the country in which he has been licensed to practice medicine and surgery will admit to practice therein citizens of the United States upon proof of prior admission to practice medicine and surgery in some state of the United States, or upon proof of matters similar to those required in this section for graduates of foreign medical schools'

"(3) In relation to the number of repeat examinations, a necessary change in the law would have to be made in Section 1258 of the Statutory Law This insertion was approved by the Council

"If a candidate fails on the first examination he may have a second examination without fee '

This phrase is then to be inserted

"A candidate, who through failures of three examinations has shown insufficient knowledge for admission to the practice of medicine, should be excluded from further examination by the Department until he presents evidence of further study in a regular school of medicine satisfactory to the Department'

"(4) As regards the special privileges for candidates from unapproved schools, these should be rescinded as soon as clearance has been made of all worthy applicants"

I move the adoption of this portion of the report Dr. Donald D Prentice, Albany I second the motion.

Speaker Andresen It has been regularly moved and seconded that this portion of the report be adopted Is there any discussion?

DR ABRAHAM KOPLOWITZ, Kings That portion that deals with failing three times and then being required to take certain prescribed courses I think is going to work a hardship It is not so easy for these men to get training in schools They have to enroll A man may fail in one for a year or two, or more subject or two and be allowed to take those over again, as is the custom now I think changing that would be a little bit unfair A lot of these boys may be graduates of our own schools and citizens of our own state I think this part should be left alone and should be omitted

Speaker Andresen Do you want to make an

amendment to that effect?

DR KOPLOWITZ Yes, I make an amendment that that part relating to taking prescribed courses if they fail three times be omitted

DR AARON KOTTLER, Kings I second the

amendment

Speaker Andresen Is there any discussion of the amendment?

DR EZRA A WOLFF, Queens It would seem that that amendment negates the entire recommendation of the committee, and I think it would be wise for the House to consider that fact when it votes on the amendment

DR HARRY ARANOW (Councillor) May I respectfully suggest that instead of taking up the recommendations wholesale we take up each one separately, and vote on them one at a time? In that way we will know what is being passed, otherwise there may be a little confusion as a man may disagree with one item and agree with another

Speaker Andresen Have you some other one

you disagree with?

DR ARANOW It seems to me that we could discuss it more intelligently if each recommendation were put to a vote separately instead of in this wholesale fashion

DR ABRAHAM M RABINER, Kings That last item about graduates from unapproved schools, that they shall not be determined until they have clearance, that is rather a vague statement What kind of clearance is intended?

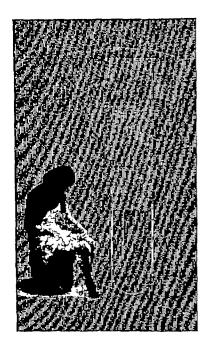

SPEAKER ANDRESEN Do you want to answer that?

DR GEIS Under a resolution that was adopted, I believe, last year by this House of Delegates and under a method of the State Board of Education there was a proposition introduced whereby graduates of unaccepted medical schools, Grade "C" schools, who had served in the armed services, in the Medical Department of the Army, Navy, or Marine Corps, upon satisfactory evidence of good work in such services and having received an honorable discharge, could be considered as candidates for medical examination and thus exceptions to the rule which provides that graduates of Class "C" schools are not admitted to our examinations That applies only to veterans of the war who served in the Medical Department of any of the armed services

DR FREDERICK A. WURZBACH, JR, Bronx And who are bona fide residents of the State of New York DR. GEIS Yes, who are bona fide residents of

New York

SPEAKER ANDRESEN There has been a suggestion made that we should act upon these recommendations in separate parts What is your pleas-

# The newly diagnosed diabetic and Globín Insulín

WHEN DIETARY MEASURES ALONE cannot control a recently established case of diabetes and insulin must be resorted to one daily injection of intermediate-acting Wellcome Globin Insulin with Zinc will often prove both adequate and beneficial This simplified regimen can be in tlated in the following manner

ESTIMATING THE DOSAGE: The simplest method is to start with 15 units of Globin Insulin and in crease the dosage every few days, as required A closer estimation is obtained by quantitative sugar determination of a 24-hour urine speci men For the initial dosage, % of a unit of Clobin Insulin is given for every gram of sugar spilled in 24 hours.

Both diet and dosage must subsequently be adjusted to meet the needs of each individual

ADJUSTING THE DIET: In general it has been found that a good carbohydrate distribution for the patient on Globin Insulin consists of 1/5 of the total carbohydrate at breakfast, 2/5 at the noon meal and 2/5 at the evening meal. Any tendency toward midafternoon hypoglycemia may usually be offset by giving 10 to 20 grams of carbohydrate between 3 and 4 p.m.

This starting diet may subsequently be adjusted as required to suit the needs of the patient. Final adjustment of carbohydrate distribution may be based on fractional urinalyses

ADJUSTING TO 24 HOUR CONTROL: Simulta neously adjust the Globin Insulin dosage to provide 24-hour control as evidenced by a fast ing blood sugar level of less than 150 mgm or sugar free urine in the fasting sample.

Wellcome Globin Insulin with Zinc is a clear solu tion, comparable to regular insulin in its freedom from allergenic properties. Available in 40 and 80 units per cc. vials of 10 cc. Accepted by the Council on Pharmacy and Chemistry American Medical Association Developed in The Wellcome Research Laboratories, Tuckahoe, New York, U.S. Patent No. 2,161,198. LITERATURE ON REQUEST

## NOW AVAILABLE AGAIN.

ESODA Brewer

Supplied-in 71/2 grains with and with out Phenobarbital 1/2 grain; in 5 grains with Potassium Iodide 2 grains and Phenobarbital 1/2 grain, and in 33/4 grains with and without Phenobarbital 1/4 grain. Capsules not enteric coated are available in the same potencies, for supplementary medication.

The ORIGINAL ENTERIC-COATED TABLET OF THEOBROMINE SODIUM ACETATE

## to control frequency and severity of attacks in CARDIOVASCULAR AND RENAL DISEASES and to prevent EDEMA

Clinical experience and studies have proven the value of Theobromine Sodium Acetate in certain Cardiovascular and Renal Diseases In Angina Pectoris, used adequately, it permits more work by the individual without developing precordial pain or distress. As one of the most effective Xanthine Vasodilators it helps increase the available blood supply to the heart and kidneys to increase the efficiency of these organs

It has also been found an effective aid in treating and preventing Edema of Cardiac or Renal origin The enteric coating (especially developed for Thesodate) permits larger doses without the drug's contact with the Gastric Mucosa

COMPANY, INC. Worcester

Massachusetts

Pediatricians and geriatricians agree upon the need for prompt control of cough because its effects are

particularly exhausting upon the child and the aged

Libby, McNeill & Libby Chicago 9, Illinois

student of the year In the department of dietary logic, she consistently rates a flunk minus—and doesn't care Some day, she says, there'll be more time for regular, balanced meals But that day never comes And so her little snacks begin a lifelong habit which eventually places her in the same class with the reducing "experts," the food faddists, the heavy smokers, the sedentary worker and all the others who contribute to the common incidence of subclinical vitamin deficiency. For such cases—in addition to dietary reform—many physicians are prescribing a reliable vitamin supplement. More and more often, it's the vitamin product which offers four important advantages.

—Dayamin capsules First, Dayamin is a true multiple product providing six essential vitamins as well as pyridoxine and pantothenic acid. Secondly, all six vitamins are supplied in amounts which make Dayamin suitable either as a supplement or, in slightly larger doses, as a therapeutic agent Thirdly, Dayamin capsules, despite their broad vitamin content and potencies, are small and easy to take Finally, Dayamin is a product of known dependability and potency, always readily available through prescription.

Abbott's Multiple Vitamins pharmacies—in bottles of 30, 100 or 250 capsules

care of

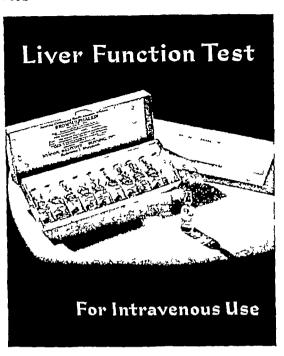

ACNE

Probably the most important point in the routine care of acne is conscientious skin by giene pfisadem, the modern soapless detergent, is par ticularly well suited for this purpose plisodern has the same pH value as normal skin and is hypo allergenic, containing no fatty acids, alkali, color or perfume.

## Sudsing detergent cream

BOTTLES OF 2 oz., 7 oz., 12 oz., 1 GALLON AND 3 oz. REFILLABLE HAND DISPENSERS. ALSO AVAILABLE IN REGULAR AND OILY TYPES. sagiples and literature.

## Bromsulphalein Sodium

Bromsulphalein Sodium Solution\* is used as a test of liver function, especially in suspected cases of cirrhosis, malignancy, hepatius, obstructive and arsenical jaundice Normally the dye is removed rapidly from the blood stream by the liver, but in the presence of hepatic disease it is eliminated more slowly. The test is performed by injecting intravenously a test dose, after which the amount of dye retained in the blood is estimated colorimetrically by withdrawing a specimen of blood for comparison with a set of standards.

Bromsulphalein Sodium is supplied in 3 cc size ampules containing a 5% sterile aqueous solution, packaged in boxes of 10 Colorimeter standards prepared from permanent dyes are also available

to correct inadequacies in infant diets

THREEFOLD ACTION

Syntronal 'Roche' selectively inhibits parasympathetic

terminations in smooth muscle. In addition, it has a direct relaxing effect on spastically contracted smooth muscle and it also relieves nervous tension and apprehension which are often important factors in spastic disorders.

Syntronal will be found a valuable agent in spastic disorders of the gastrointestinal and urinary tracts, and in spastic dysmenorrhea. Syntronal is available in sugar coated tablets, each containing 50 mg of Syntropan 'Roche' (phosphate of dyl-tropic acid ester of 3-diethylamino-2,2 dimethyl-1-propanol) and.

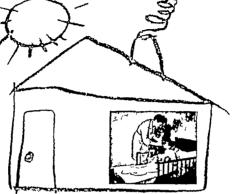

15 mg of phenobarbital. Write to Department A 6 for a clinical sample of Syntronal.

## SYNTRONAL Roche

Here's the sulfadiazine

that children actually like to take

Children have

no

reluctance

ın

taking Eshadiazine

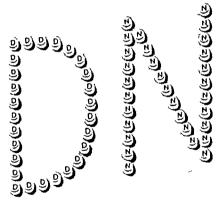

Exceptionally flavorful, this fluid sulfadiazine is the ideal dosage form for your young patients. They take it will ingly because it tastes good. And it relieves tired parents and busy nurses of the chore of crushing tablets and coaxing a sick child to swallow an unappealing mixture.

Important, too is the more rapid absorption of Eskadiazine Flippin and associates\* have established that desired serum levels are attained in two hours rather than the six hours required for sulfadiazine in tablet form

Eskadiazine

Smith Kline & French Laboratories, Philadelphia

the outstandingly palatable fluid sulfadiazine for oral use

# There may be many Digitoxins but there is only one DIGITALINE NATIVELLE

Digitaline Nativelle has created a new trend in the treatment of congestive heart failure, auricular fibrillation, and auricular flutter. Ninety-five per cent pure, its uniformity of potency permits dosage determination on the basis of the weight of drug, a new departure in cardiotonic therapy. It also permits of rapid digitalization by the oral route—in 6 to 10 hours—when this expedient is desirable. Before the coming of Digitaline Nativelle, such rapid digitalization was not feasible.

In Digitaline Nativelle the physician is assured of a digitovin backed by over 50 years of pharmaceutical manufacturing experience and skill, a factor of utmost importance in a drug upon the dependability of which the very life of the patient may depend. Average total initial digitalizing dose, 1 2 mg given in equally divided doses at an interval of 3-4 hours, maintenance dose, 0 1 mg to 0 2 mg daily, depending upon individual response and physical activity

To insure your patients' receiving the original, Council Accepted digitoxin, kindly specify Digitaline Nativelle on your prescriptions

Physicians are invited to request a complimentary copy of the brochure "Management of the Failing Heart and a sample of Digitaline Nativelle sufficient to digitalize one patient

#### How Supplied

Digitaline Nativelle is available through all pharmacies in 0.1 mg tablets (pink) and 0.2 mg tablets (white) in bottles of 40 and 250 and in ampules of 0.2 mg (1 cc.) and 0.4 mg. (2 cc.) in packages of 6 ampules and 5.0 ampules.

## Editorials

## What Your Taxes Buy in Washington Federal Health Workshops1

Inordinate increases in Federal expenditures for publicity and propaganda led the Committee on Expenditures in the Executive Departments<sup>2</sup> to investigate activities of the United States Public Health Service, the Children's Bureau, the Office of Education. the U.S Employment Service, the Department of Agriculture, and the Bureau of Research and Statistics, in the Social Security Board, in connection with "health workshops" as set forth in our two preceding editorials. The Attorney General has been "requested to initiate proceedings to halt the use of public funds in this manner "\*

It would seem to be about time this were Regrettably we note the increasing tendency of certain departments of government to lend themselves to the propagation of philosophies and modes of conduct which do not seem consonant with the concepts and operation of a Republic That this is not done openly and above board but under the

cloak of what might well be a legitimate project of such an agency of government is the more disturbing by reason of the recent examples we have noted in Europe of subversive elements working within the framework of the historic or traditional or legiti mately constituted structure of government Such was lately the tactic of the Nazi party in Germany, such seems to be the tactic of the U.SSR, with respect to its satellite

The findings of the Subcommittee on Publicity and Propaganda of the House Committee on Expenditures in Executive Departments with respect to the "health workshops," involving at least six agencies of government, not only accuse these six Federal agencies of using government funds improperly for propaganda activities to "build up an artificial, federally stimulated public demand on Congress for enactment of the Wagner Murray-Dingell bill providing compulsory health insurance" but also raise the question who or what is behind such propaganda for socialized medicine?

The report of the investigating committees

<sup>1</sup> This is the last of a series of editorials on this subject. Prior editorials appeared in the September 1 and 15 issues.

1 House Report, No 785 80th Congress, First Session,
July 2 1947

1 J.A.M.A 134: 960 (July 13) 104\*

"invites particular attention" to the testimony and cross examination of the representative to the US Children's Bureau of the Federal Security Agency, "because we (the committee) feel that the devices and arrangements of Federal employment in this instance provide a typical example of how funds appropriated by Congress for the legitimate expenses of Federal agencies are diverted within the bureaus to full-time propaganda for socialized medicine"

We commend heartly the work of the Committee on Expenditures in Executive Departments for disclosing the improper use of Federal funds. The physicians of the State of New York will add their demand to the recommendation of the Committee that the Department of Justice initiate proceedings "to stop this unauthorized and illegal expenditure of public moneys."

We urge also that steps be taken by the appropriate committees of Congress to ascertain the influences at work within the six above-mentioned agencies of the Federal

government, and which may be responsible for the subversion of their proper functions and activity

Merely to stop the illegal diversion of public moneys without ascertaining why or at whose instigation the diversion was made, or in whose interest propaganda favoring compulsory health insurance or socialized medicine was to be disseminated by the device of the "health workshop" would be, in our opinion, to permit decay and rot to destroy eventually the structure of American life and government

If the American people want socialized medicine, they can obtain it in perfectly proper ways without the assistance of government bureaus

If they do not want it, they can clean out the group or individuals within the government who are spending public moneys in the attempt to create a fictitious sentiment for socialization, and find out why they are doing so

We strongly urge that this be done

## The Plethoric United States of America

The United States of America differs from almost every other country in the world in that at present it is in a state of plethora

We felt very happy about that statement until we looked up the word "plethora" in the dictionary and found that in colloquial parlance it means a "state of unhealthy repletion"

Then we began to wonder why we had made the statement From what we read in the papers it would certainly seem that we have more food, clothing, automobiles, houses, gasoline, oil, paved roads, roadhouses, liquor, moving pictures, shirts, shaving creams, and luxuries generally than any other country in the world

And yet for all these blessings we are not a happy nation Thumb through the morning paper any day and lot down on a sheet of paper the items you can find that would give anyone the slightest cause to be happy about anything

Suddenly it occurred to us what was the worst plethora—unhealthy repletion—with which this country was afflicted Education

Several hundred years ago education was a privilege It was something for which a few made tremendous sacrifices, and for those who made the sacrifices education earned them respect Like all privileges, it was early recognized as desirable and as such was seized upon and made the monopoly of a class—the clergy Harvard and Yale were colleges founded for the education of ministers, who, by the way, were very strong in the governing classes of their communities Loud were the howls that went up from the ecclesiastics when Thomas Jefferson came along with his "pernicious doctrine" of education for the masses

Jefferson had some sense He advocated elementary schooling for everyone He maintained that after a child had learned the "three R's" it might then be possible for his preceptors to decide whether or not he was fitted to pursue the higher learning, or whether he should be sent to a trade school How we wish that his counsels might have prevailed! We concede that there were flaws in them We doubt that,

at a given age, a child's true abilities can be judged by anyone. But we do think that in the vast majority of cases to a reasonable extent they can be. The true genius rises in spite of anything. If you don't believe us, we refer you to the obituary notices of Mr. Goudy, the type-designing genius who died recently.

A correspondent tells us of two halfwits who are the two happiest human beings he knows. They were early recognized as halfwits and no attempt was made to subject them to formal education. Both of them turned out "to have a green thumb" and as growers of vegotables and handlers of animals they are without a peer in their communities and are esteemed highly.

It seems likely that of all classes of people those engaged in the practice of medicine and its subsidiaries are suffering most acutely from this "permisious hypereducation"

The only sensible organization that our correspondent can think of is the French He was attached to it for six weeks. housed, appropriately enough, he remarks in the Insane Asylum of the Department of the Somme In the Insane Asylum he found sense, for the French Army Medical Corps was divided sharply into two classes. the Regulars and the Reserves. There was little love lost between them The Regulars, referred to by the Reserves as ces sales types d'actives, ran the hospital in all its ad ministrative details. The Reserve Officers did the operating Each did the task for which he was qualified. The results were excellent

How different, our correspondent remarks, from the practice in the Army of the United States, where a man might be promoted, because his mortality rate as an operator was extraordinarily low, to a rank in which he had no opportunity to exercise his operative skill and in which his ineptness as an administrator, to which his higher rank had doomed him, was equally extraordinary

Are we not pursuing exactly the same silly course, he asks, in our methods of education in medicine and its ancillary branches? There was a time when a gur enrolled in a training school for nurses because she wanted to look after sick people Where is she now? To begin with, she must have a college degree—With that indispensable preliminary she now aims at becoming a superintendent of nurses, a public health nurse, an official in the National Tuberculosis Association, the head of her own private hospital

We concede that we cannot go back to Jefferson's primitive ideas But can we not possibly arrive at some conclusions as to who is fit for what not exposing everyone recklessly to the dangers of higher education? Cannot we have courses for those who want to be just doctors or nurses, or trained attendants, or laboratory assistants? Cannot we reserve the somewhat questionable benefits of so-called busher education for those who have shown themselves to be qualified for it? Must we expose everyone to the test of the range on which we know very well that the targets are set too far for the majority of the candidates to hit? Must we send them through the rest of their lives with the tin can of failure tied to their tails, when we should have known well in advance that they should never have been allowed to try the impossible tests devised for them?

Doubtless, we shall be thought to be reactionary, but in this plethone country we submit we are in a plethora of higher education

We would remind our readers of the sound common sense of that old seventeenth century military song—"The merry heart goes all the way—the sad one tires in a mile-a."

We submit it is time to get rid of our plethora of "hypereducation" and to make the hearts of our students merry by setting them tasks graded according to their abilities, instead of making them unhappy by educating them for tasks for which any one with a modicum of sense could have realized they were inadequate

We end this editorial upon a note of sorrow We have spoken of a "modicitin of sense Who has one? We have also written as if we had a little more sense than others have, as if we thought we might be better able to separate the sheep from the goats than most of our qualified educators. We apologize We don't really think so

But we do know that if an unhappy fate had ever pitchforked us into such an awful responsibility as having to make lifelong decisions for other people, we should stress under-, rather than overeducation

The person who is exposed to higher education and is not qualified for it goes through life a disappointed and unhappy man has been given every opportunity for selfadvancement and has failed miserably

A person who has been undereducated and realizes it can always get more education Because he knows what he wants it for and appreciates the necessity for it. One who has been hypereducated does not know why and has been made permanently unhappy by having tools placed in his hands which he does not understand and will never know how to use Education for unhappiness is a terrible responsibility

## Current Editorial Comment

We have just had the some-Eugenics what dubious pleasure and privilege of reading an article entitled "Improving Genetically the World Population "1 We think it worthy of brief comment because it illustrates so perfectly the tendency of the brilliant mind to lose itself in the mists of speculation and to divorce itself totally from the real world

The article begins "Statement on the Genetic Improvement of Mankind" could not do justice to the article except by reprinting it in full, and we would not perpetrate that injustice upon our readers We lay ourselves open to grave risk by attempting even to abbreviate or summarize its ponderous absurdities

"One cannot compare the intrinsic worth of individuals 'without economic and social conditions which provide approximately equal opportunities for all members of society instead of stratifying them from birth into classes with widely different

privileges

"The removal of race prejudices and of the unscientific doctrine that good or bad genes are the monopoly of peoples or perwill not be possible before the conditions which make for war and economic exploitation have been eliminated This requires some sort of federation of the whole world

"This (the study of genetics) can, however, only come about when mens' minds are turned from war and hate and the struggle for the elementary means of subsistence to larger aims, pursued in com-

These statements—those who care to read them in full are referred to our footnoteare signed by F A E Crew, F R S, J B S Haldano, F R unheal Harland ML T

Leaning backward in our desire to be fair, we recall to your attention the fact that the article from which our excerpts are taken was written in 1939

What has happened since? est anti-eugenic world movement that has War—almost universal ever been seen War—the great scrambler of eggs alliances, casual or otherwise, the overnight stops or lifelong associations between the geniuses of one race and the morons of We venture to say that there is no proving ground like that of war Eugenical News may speculate as much as it pleases—or can afford to—about "Improving Genetically the World Population," but world upheavals such as we have witnessed and are now witnessing throw all their philosophic speculations into the dustbin

If the Eugenical News is really interested in genetics we refer it to serious breeders of animals Animals—dogs, horses, cattle, and such—are the only beings in this unhappy world whose breeding habits may, can be, and are controlled by man

The Mormons tried in their polygamous society to breed to one strain—the financially successful male Every man was required to impregnate as many wives as he could support Their polygamy was not a matter of lust, but of economics The Mormons' skeptical neighbors found difficulty in understanding that, and they were not long allowed to continue the practice

The only intelligently practical comment we have seen on the subject of eugenics was the reply of an old French nobleman who was asked by his grandson, "Grandfather, what did you do during the Revolution?"

"My boy," he said, thoughtfully, "I survived"

Eugenical News 24 63 (Sept ) 1939

## AN EVALUATION OF ANESTHESIA WITH PENTOTHAL SODIUM, NITROUS OXIDE, AND ETHER

PAUL W SEARLES, M.D., MS Buffalo, New York

(From the Department of Anesthesiology University of Buffalo)

A CONSTANT search is being made for the ideal anesthetic. In my exponence the combination of sodium-pentothal, nitrous oxide, and ether provides a general anesthetic which approaches the ideal.

The selection of pentothal-sodium and ether was based on previous experiments on dogs which led me to believe that the barbiturates possess a tendency to protect the animal organism against the toxic effects of ether. In these experiments it was revealed that ether caused a concentration of the blood whereas the barbiturates produced a dilution of the blood. Nitrous exide was included in the combination to secure a deeper anesthesia during induction with sodium pentothal and allow for an earlier introduction of ether.

Impetus was given to studying the combined anesthetic effect of pentothal-sodium, nitrous oxide, and ether because of the author a experience in World War II Cyclopropane was unavailable to the majority of the US armed forces in the European Theatre therefore, sodium-pentothal was used to secure a quiet and rapid induction One form of anesthesia used in England consisted of a single large dose of pentothal-sodium for in duction followed by maintenance with nitrous oxide It was felt by most of the ancethetists in the U.S armed forces that a far eafer and a more satisfactory anesthesia could be obtained by the use of fractional doses of pentothal-sodium for induction followed by a maintenance with nitrous oxide and intermittent injections of sodiumpentothal The latter combination provided a light surgical anesthesia for extremity work and other operative procedures of longer than onehalf hour duration requiring only moderate amounts of relaxation. Ether was added to this combination whenever relaxation was desired The method proved very entisfactory especially on the Continent when temperatures were low and inductions were difficult

It has been my expressed purpose, since the termination of hostilities, to study and evaluate the combination of pentothal-sodium, nitrous oxide, and ether anesthesia in all types of individuals coming to surgery and to determine any detrimental effects attached to its use

#### Administration

The preoperative medication in good risk patients between 18 to 60 years of age consists of morphine sulfate grains ½ (0 01 Gm) and atropine sulfate grains ½ (0 0006 Gm.) given one hour before operation. Pentobarbital sodium (nembutal) also is administered in 1.5 grain (0 1 Gm) doseage one hour before operation in very excitable or robust patients. Many of the untoward effects of this combination of anesthetics can be traced to improper preoperative medication

The patient is induced by the intermittent or fractional injection of sodium-pentothal in a 2.5 or 4 per cent solution. With the onset of un consciousness nitrous oxide in approximately an 80 per cent concentration and oxygen in a 20 per cent concentration are administered by a mask from a standard anesthetic machine, employing carbon dioxide absorption When sufficient depth of anesthesia is obtained, for example second plane surgical anesthesia, ether is slowly added and increased to a position on the ether gage where one half of the gases are passing through the ether container. It should never be necessary to turn the other on full If the other is well tolerated the nitrous oxide is reduced and the oxygen increased to a point which allows for a minimum concentration of 30 per cent oxygen When relaxation has been obtained, the amount of other is decreased. If more relaxation is desired during the maintenance of anesthesia, 1 to 2 cc. (25 to 50 mg) of a 25 per cent solution of sodium-pentothal are injected and the other again increased to a position on the ether gage where one half of the gases are passing through the ether container. The resultant depressed respira

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Section on Anestheriology May 7 1947 Buffalo

tion from the injection of the sodium-pentothal must be "reinforced" by manual pressure on the Relaxation and a quiet field is breathing bag obtained readily and quickly In some instances an apnea is produced either purposely or coincidental with the administration of the anesthetic This appears due to the depressant action of sodium-pentothal on the respiratory center and to the washing out of the carbon dioxide by hyper-When this occurs, "controlled" respirations should be immediately carried out by manual pressure on the breathing bag It must be emphasized that "reinforced or controlled" respirations greatly increase the amount of ether entering the blood stream, therefore, the ether must be reduced in amount or completely shut off when using these technics Respirations may be quickly restored to normal by emptying the breathing bag of the anesthetic and refilling it with oxygen This procedure will allow the carbon dioxide to accumulate providing the carbon diovide absorption chamber is shut off completely Ten per cent carbon diovide in oxygen or a respiratory stimulant such as nikethamide, metrazol, or picroto in may be used but is seldom

The postoperative period is marked by a minimum of anesthetic complications and sequelae Recovery is rapid, providing the dose of pentothal-sodium has been small. Return to conclousness is quiet and pleasant with a minimum of mucus, nausea, and vomiting. Pulmonary complications, including atelectasis, are reduced because of the small amounts of mucous secretions.

#### Indications

It is my purpose to suggest that intravenous anesthesia with pentothal-sodium can be used in major abdominal operations requiring relaxation, providing that it is used in combination with nitrous oxide and ether. The method is also applicable to chest surgery where quiet and, at times, "controlled" respirations are necessary. In general, with few exceptions, when ether is the anesthetic of choice, a more satisfactory and adequate anesthesia will be secured by the use of this combined method.

#### Contraindications

It is well to avoid the use of the combination of pentothal-sodium, introus oxide, and ether in patients with cardiac history. This is true especially in patients suffering from dyspinea whether it is of a cardiac or pulmonary origin. Children under ten years of age offer a contraindication to the method because of the difficulty in making a venapuncture and instability of their respiratory mechanisms. It should not be used in patients with severe liver damage because they

tend to have a long recovery period after the administration of a barbiturate such as pentothal-sodium. Special care must be taken in the administration of this method to old patients as only small doses of these agents are required to produce anesthesia. Caution should be used in the administration of this combination of anesthetics in alcoholics. The alcoholic may require an excessively large dose of pentothal-sodium for induction and the result may be a long post-operative depression. In general, any contraindication to pentothal-sodium, nitrous oxide, or ether when employed alone will apply to their combined use

## Complications

A marked fall in blood pressure occurred in three cases, two of which had an existing hypertension and a third a cardiac arrythymia. In all three cases the ether had been turned on full and left on after the administration of sodium-pentothal. Shutting off the ether and refilling the breathing bag with 100 per cent oxygen restored the blood pressure in the two cases and abolished the cardiac arrythymia in the third case. Frail or poor risk patients also showed small drops of 10 to 20 millimeters of mercury in systolic pressure. These small drops could be remedied by adequate ventilation and oxygen.

Hiccups occurred infrequently but when present proved troublesome to the surgeon However, the luccups were relieved in all cases by the intravenous administration of an additional dose of 1/150 grain (0 0004 Gm) of atropine sulfate and by allowing the carbon dioxide to accumulate in the breathing bag Coughing and laryngospasm occurred occasionally and in most instances were due to the premature introduction of ether or an airway during induction Treatment consisted in removing the mask and pulling the tongue forward, or in the more protracted cases of administering atropine sulfate grains <sup>1</sup>/<sub>150</sub> (0 0004 Gm) intravenously The insertion of an intratracheal tube and artificial respiration were employed in only one case

#### Discussion

The ideal general anesthetic should possess the following characteristics—a wide safety margin, a rapid pleasant induction, adequate relaxation, quiet operative field, and an early pleasant recovery with a minimum of postoperative anesthetic complications—Pentothal-sodium provides a satisfactory induction and a quiet operative field—Nitrous oxide when administered with adequate oxygen in this combination adds to the anesthetic effect and fulfills all the characteristics except that of providing relaxation—Ether succeeds in fulfilling all the requirements when used

in combination with pentothal-sodium and nitrous oxide. The safety margin of these three popular anesthetics is greatly increased because the dose is less in this combination then when any one of them is used alone.

The use of the barbiturates as protective agents against the toxic effect of certain anesthetics is well-established clinically The barbiturates are employed as antidotes in the treatment of convul sions caused by the toxic effects of cocaine, nova caine, and ether Also the barbiturates are used in preoperative medication to allay excitement prior to induction of a general anesthetic. This excitement together with the administration of ether tends to cause a contraction of the spicen, resulting in a loss of reserve blood supply fore, it seemed advisable, both to further reduce the excitement and to counteract some of the toxic effects of ether, to induce the patient with a barbiturate such as sodium-pentothal

The rapid relaxation obtained under 'rein forced or controlled" respirations is most unlikely due to flooding of the brain with ether It is not necessary to administer large amounts of other to produce this relaxation In fact, great care should be exercised to avoid high concentration of ether to prevent the administration of an overdose It should be pointed out that many of the deleterious effects of ether come from using highly concentrated mixtures which are very irritating to the mucosa and produce excess mucus and respiratory difficulties In compari son the amount of ether used with the combination of pentothal-sodium, nitrous oxide, and ether is reduced to one half of that necessary with a nitrous oxide-ether sequence

The average dose of sodium pentotial is small when used with introis oxide and other. The dose varies from 0.7 to 1.0 Gm, the greater part of which is administered during the induction. When using the 'controlled' technic of anesthesia with this combination of anesthetics respirations return rapidly once the carbon dioxide balance is restored. For this reason, it might be assumed that the small amounts of sodium-pentotial administered during the maintenance are destroyed fairly quickly.

#### Summary

The use of intravenous enesthesis with pentothal-sodium is not confined to minor operations. Pentothal-sodium when used in combination with nitrous oxide and ether can be employed in major operative procedures requiring muscular relaxation. A quiet induction and adequate relaxation were obtained in all types of surgical operations. "Controlled" respirations can be obtained easily during the combined uso of pentothal-sodium, introus oxide, and ether anesthesia. The dose of any one drug required in this combination of anesthetics is less than when used alone, for this reason, and because the barbiturates protect the patient against the torue effects of ether, the patient recovers earlier with less deleterious effects.

#### Discussion

Dr Hubbard K. Meyers Buffalo —I would like to emphasize the point concerning the reduction in total desage of the agents used, which I believe is very important, especially in the aged and poor risk patient.

It would seem that the combination described is about as close to the ideal general anesthetic that we have today However I should like to mention a modification with the addition of another agent which I have employed I refer to induction with sodium-pentothal and maintenance with nitrous oxide and oxygen and other in the first plane of sur gical anesthesia and the addition of curare for necessary relaxation. It has been my experience that nationts react more readily after this sequence often at the conclusion of the operation or when being lifted onto the litter. The dosage of curare is regu lated to produce proper relaxation and is, of course usually less than when ether is not used but with the very small amount of other necessary to maintain light surgical anosthesia, dosage often amounts to 80 or 100 units. The use of curare also aids in overcoming or preventing laryngospasm if it should occur due to the irritating effect of ether or traction refloxes

Dr Searles stated that he believed that his method was contraindicated in patients with a cardiac history. It has been my belief that a cardid quiet calm induction with sedium pentothal with the addition of a 50 to 50 mixture of nitrous exide-exygen and other is to be preferred to a stormy struggling anoxic induction with mitrous exide-exygen and other or drop-ether in a cardiac patient. I should like to ask for comment on this point.

It would be interesting to know also if the author considers it necessary to intubate patients routinely in those to whom he expects to utilize the tochnic of controlled respiration in order to provent distention of the stomach with anesthotic gases.

## THE TREATMENT OF INTRACTABLE PAIN

Donald Stubbs, M D , and James P Murphy, M D , Washington, D C \*

(From the Gallinger Municipal Hospital)

THE traditional role of the anesthetist is in the relief of pain during surgery. The interest in pain itself, however, is much broader. The anesthesia service should be asked to help with the management of pain on any other service whenever this symptom is a significant factor in the disease.

All are agreed that no other symptom is so often the cause of medical attention being sought. The specialist then, who would concern himself with the broad aspect of pain, must classify it and develop a rational approach to the many clinical types. The most important teamwork is that between the anesthesiologist and the neurosurgeon, for it is to the latter that intractable cases must usually be referred. This teamwork has been carried through in the authorship of this paper.

In discussing the nature of pain Wolff¹ properly stresses the two phases. Pain perception depends upon threshold and varies only within narrow limits. Reaction to pain is individual and varies greatly. Two patients may have the same measurable perception threshold. The first may have little response to a given painful stimulus. The second may over-respond tremendously, and the response itself, with increasing tensions and lowering of conscious control, may add to the pain. It is physiologically true that the person who refuses to react to pain will have less

On a general medical service there are many occasions when pain relief has real curative value in disease. In coronary occlusion the great pain increases metabolism and ovygen requirement at the time when the myocardium may be unable to respond with increased circulation Complete rest with pain relief in a few minutes may be lifesaving Though less hazardous to life, the pain of gallbladder or kidney colic may seem as serious to When the immediate relief of great the patient pain is important, the proper treatment is the intravenous injection of narcotics There are three advantages to this method of administration Response is rapid enough that dosage can be properly graded and, therefore, made safer dosage is much less The rapidity of effect makes the patient conscious of improvement so that much less elevation of the pain threshold may be effective Seven to 10 mg of morphine intravenously may give more pain relief than several 15 mg hypodermic injections at half-hour intervals

On the surgical service and outside of the operating room, pain relief may be critical. After surgery of the chest or even upper abdomen, wound pain may prevent the patient from coughing or breathing deeply enough for minimal safe ventilation. Pain relief by narcotics may obtuind the cough reflex and depress respiration even further. On the other hand, simple intercostal block with procaine may reverse a downhill progress in a matter of minutes. Also the intravenous use of alcohol often may prove valuable

Pain is usually associated with circulatory impairment. Many factors have contributed to the present wide consciousness of the therapeutic value of appropriate sympathetic nerve blocks. Following the lead of Leriche, Ochsner and many others have used sympathetic blocks in the treatment of thrombophlebitis. Early pain relief has been one of the striking results. During the war, extremity injuries with attending vasospasm and pain were commonly repaired using regional block anesthesia. Not infrequently the operating team saw circulatory improvement as they worked, in some instances to the extent of reversing the decision to amputate

Pulmonary embolism is the outstanding example of vasospastic damage, potentially mortal Relief from pain and vasospasm by stellate ganglion block and efforts to maintain oxygenation may save some of these cases now lost

Although they quickly become too toxic to respond to it, patients with anuma from tubule blockage have significant early pain. Whether the anuma is due to transfusion reactions, to chemical damage, or even to persistent hypotension, all should have the benefit of splanchine block properly performed. Similarly, acute pancreatitis is indication for splanchine block.

Certain cases of severe dysmenorrhea will be relieved by low lumbar sympathetic block at the beginning of the pain cycle

It is not intended to imply that the pain itself is the dangerous factor in the foregoing discussion Instead, it is true that the earliest effective relief of the pain will tend to remove its cause and thereby become a fundamental form of therapy

By contrast with the above there are conditions in which pain may have lasted so long as to assume a significance out of all proportion to its threshold value. The value of pain as a habit is undeniable. The response even to a little pain may become maximal. For this reason the treat-

<sup>\*</sup> Presented by invitation at the 141st Annual Meeting of the Medical Society of the State of New York, Buffalo Section on Anesthesiology May 7 1947

ment of chronic pain with drugs to elevate threshold may be ill-advised unless the causative condition is cumble and short lived. If it is incurable, the relief of pain then becomes the principal clinical objective and early measures are justified to relieve the pain rather than merely to elevate the threshold to stimuli producing it

#### Case Reports

Case 1 —Measures which were too little and too late may be illustrated by a patient with herpes zos-A 42-year-old white woman had been treated for herpes of the left iliac region for two weeks by analgesics and lotions As the cruption receded the pain seemed to increase A competent neurologist used nerve block therapy finally culminating in a paravertebral alcohol injection. For the neuritis which resulted chordotomy was later performed with temporary partial relief Three years after the origin nal lesion this patient was turned down for subarachnoid alcohol injection because she was ambulatory with good rectal and bladder control most the only measure left is prefrontal lobotomy It is natural to speculate on the difference in course if paravertebral procaine block had been used at the beginning of the pain

Case 2 - A white woman aged 62, was seen for perineal and hip pain secondary to carcinoma of the uterus with extensive pelvic fixation. We were becoming interested in ammonium sulfate intrathecally and tried it on her following the technic of Judovich . This procedure was employed three times in the fall of 1944 with partial relief each time of less than two weeks. Subsequently various ones of the sacral nerves were blocked at frequent intervals using procaine anucaine and 95 per cont alcohol. Epidural block with 1 per cent ammonium sulfate was done several times. Most of these steps were helpful but very short lived. For two years a retention catheter has been necessary because of tu mor encroachment on the bladder A permanent colostomy was done fifteen months ago Hemor rhages severe enough to reduce hemoglobin below 50 per cent have occurred more than a dozen times. Seven months ago alcohol in the third and fourth sacral nerves produced a neuritis relieved only by subarachnoid alcohol block. Four subsequent repetitions of this latter procedure have maintained fair comfort to the present time

Obviously this patient should have had bilateral chordotomy three years ago. It was rejected by several consultants on the grounds that she would live only a short time. At present she walks to her car to go home to dinner three days a week. This patient has been the recipient of nearly every procedure we know in block therapy.

Case 3—A 28-year-old white woman had received nearly every possible form of orthopedic ther apy for pain in the right thigh posteriorly Marked relief followed caudal block with 1 per cent procaine 30 cc. followed by 30 cc. normal saline to increase the fluid pressure There had been no recurrence six months later This nonspecific response is pussling but is a clinical fact in a few cases

Case 4-1 64-year-old white man explored for

advanced hypernephroma on the left had severe postoperative pain Paravertebral block of D<sub>18</sub>, D<sub>11</sub>, and D<sub>21</sub> using anucame and repeated in two weeks gave reasonable comfort for the remaining any weeks of life

Case 5—Diagnostic sympathetic block as a preliminary to specific surgery is a worth-while procdure However, it can be misleading A 32-proceddwhite woman had had a protruding lumbar disk removed which was thought to be the cause of pain in the left leg. The operation was unsuccessful and was repeated some months later. However the pain soon recurred, perhaps worse than over A left umbar sympathetic block with procaine gave dra matic rollef. The same result was obtained by repetition of the block a week later. Left lumbar sympathectomy gave vascular rolaxition but the pain was unaffected. Probably the nerve block affected the paravertebral roots as well as the sympathetic trunk and thus was more extensive than the surgery

These cases illustrate the variety of the problems in nerve block therapy as well as the difficulty of obtaining good results

In the recently-established pain clinic at the Gallinger Municipal Hospital we are obtaining acceptance of a routine management, as Roven stine did in 1936.

The first essential is that a tenable working diagnosis be established. Second it is stressed that the effectiveness of pain relief is proportional to the speed with which it is instituted. This is especially true of the acute, severe pains. Here treatment should be initiated by elevation of the pain threshold by the use of intravenous morphia. The usual medical or surgical management will be adequate beyond this point in the case of such conditions as coronary occlusion gallbladder or kadney colle and traumatio injuries.

Nerve block therapy should be considered for all chronic pains of a localized nature and for conditions due to visospasm. The first step is the effort to localize the pain as narrowly as possible by the use of procaine. If the pain can be controlled by the use of procaine without undesirable motor effects, longer lasting agents should be used. Procaine in oil will give the same effect as aqueous procaine but for days or weeks instead of hours. If effective procaine block involves undesirable motor effects, the best agent to try is ammonium sulfate?

Alcohol is reserved for terminal incurable disease and for the cases where injection can be made to involve only sensor, or sympathetic fibers. Some comments on technic are in order Procaine is generally employed in a 1 per cent solution. Care to achieve accuracy of placement and injection of small amounts will improve results. These factors have been stressed by many workers since Labat's pioneering in the twenties. When oily solutions are used, aspesis is essential because of the infection hazard.

Since Judovich and his coworkers showed that the ammonium ion is the active principle in pitcher plant extract. there seems little reason to use the more complex mixture Furthermore. few will be prepared to make their own solutions of ammonium sulfate or chloride Through the courtesy of Dr George Hazel of the Abbott Laboratories we have used ammonium sulfate in sterile amoules The intrathecal injection of 250 to 300 mg ammonium sulfate in 30 to 40 cc spinal fluid has been used nine times and discarded because good results occurred only five times and lasted only three to five weeks, and because the immediate reaction was so great cases had headache and at least some nausea and vomiting This corresponds to Hand's experience 10 We have had as good results in cases of pelvic pain using 20 to 30 cc of 1 per cent ammonium sulfate in the caudal canal following the injection of 15 cc of 1 per cent procaine for early We accept the statement that the analgesia ammonium ion in this concentration does not affect sympathetic fibers and that, therefore, it is important to use it for somatic types of pain with associated segmental tenderness

In late carcinoma with pelvic pain the subarachnoid injection of alcohol is often indicated 11 For perineal pain we have modified Doghotti's method by introducing a Tuohy catheter into the spinal canal with tip passed caudad as far as possible X-ray films are taken to prove that the catheter tip is in the sacral region after which the patient is placed prone in bed with buttocks elevated on three pillows Absolute alcohol injected slowly will stratify above the spinal fluid more certainly than when allowed to float up from a needle tip The canal fills from the caudal end so that accurate judgment of amount is possible These catheters vary in contained volume from 01 to 03 cc and allowance for this must be made in accurate measurement of injected alcohol A half cc will give perianal and perineal anesthesia. One cc will extend forward to the urethra and to the lower Up to 11/2 cc and possibly more will spare leg muscle control Since most of these patients already have bladder and rectal damage, often with colostomy, the larger dosages can be employed and still keep them ambulatory have used this catheter method seven times and believe it to be an improvement for perineal pain

In general the use of subarachnoid alcohol should be reserved for those patients who are not considered safe for surgery or in whom a downhill course is quite rapid

## Neurosurgical Considerations

The neurosurgery of pain is an essential continuation of nerve block therapy in many cases

and for some should be the first consideration. The points outlined on the preceding pages are of real importance at this time, when more and more patients are developing degenerative and malignant diseases so frequently complicated by unbearable and often widespread pain. They should be of equivalent interest to the neurosurgeon and the anesthetist because of the close cooperation which should exist between the two specialties in an attack upon pain as a primary problem. The development of "pain clinics" in medical centers should be sponsored by both specialties, for a division of labors is becoming increasingly necessary in order to offer adequate therapy to sufferers

Pain-relieving procedures are essentially destructive, but this should not mitigate nor prevent their usefulness in rendering the agonized existence of a patient bearable once again, if only for a few short weeks. Each moment of severe pain seems like an eternity, as we all know, and we also know from physiologic experimentation as well as personal experience that there is little or no accommodation of the organism to pain, and that each new painful experience is as severe as the one preceding. Leriche said that the only pain which is borne easily is that in someone else. On most neurosurgical services, cases of intractable pain are considered as surgical emergencies, as they properly should be

The approach to the relief of pain may be made at one of several levels It is the intention of the surgeon to break the circuit of electric impulse Most peripherally, pain receptors may be isolated from their central connections by interruption of the peripheral nerve (cranial or spinal) infiltration of one of the three divisions of the trigeminal nerve at the point of emergence from the skull may eliminate the paroxysmal attacks characteristic of tie douloureux for many months, or may free a patient with carcinoma of the tongue or law from pain for the remainder of his Crushing or division of the sensory nerves in the leg can do much to ameliorate the painful features of Buerger's disease Recently, chronic visceral pain has been treated successfully by resection of the major splanchnic nerves and tenth to twelfth thoracic sympathetic ganglia, Lumbar sympathectomy long has bilaterally been known to be effective in relief from causalgia, and is often equally efficacious in treatment of ischemic pain in the leg due to vascular disease

Rhizotomy (division of the nonmyelinated axon of the peripheral sensory ganglion) is more permanent in its effects, because of prevention of regeneration of pain-conducting filaments. Retrogasserian neurotomy is the procedure of choice in the treatment of trigeminal neuralgia, and there is no recurrence of the condition. Dorsal intraspinal rhizotomy can eliminate the neuritis which

may be an aftermath of injuries to the chest, abdomen, or extremities or may complicate surgical procedures such as thoracoplasty Extensive. bilateral rhizotomy has been employed successfully in cases of intractable cardiac angina, al though resection of the inferior cervical ganglion with upper three thoracic sympathetic ganglia on both sides, as advocated by Olivecrona, 12 is a procedure less formidable in a poor cardiac risk

Chordotomy, introduced at the suggestion of Spiller 12 has proved to be an effective attack upon pain at an intermediate level By this operation pain-conducting tracts in the anterolateral superficial columns of the spinal cord are sectioned and touch fibers travelling largely in the postenor columns are spared so that complete anesthesis of the part of the body rendered painfree does not result. It is most useful in cases of pain of one lower extremity or of one half of the body below the umbilious, when umlateral chordotomy may be sufficient

If a malignant condition exists in the abdomen or pelvis, however chordotomy should always be bilateral. In the latter instance weakness of the legs and bladder difficulty may be troublesome for some time. Section of the spinal root of the trigeminal nerve in the medulla, a procedure devised by Sjoquist,14 is an equivalent operation for relief of pain in the face, for touch is again preserved in the areas partially denervated. When malignancy is invading the face and neck, such medullary tractotomy may be combined with rhisotomy of the upper cervical nerves on the affected side

Very recently prefrontal lobotomy, originally introduced by Freeman and Watts18 to the treatment of mental disease, has been extended to the problem of organic pain. It is best suited to the case of widespread or manifold pain with malig nancy, or may be used when pain involves the neck and arms It is effective by its prevention of pain from becoming a psychic experience, and is the most successful approach to the elimination of prin at the highest level Resection of portions of the postcentral (sensory) cortex corresponding to divisions of the body afflicted has been advocated by de Custerrez-Mahoney " Thus procedure involves the elevation of a large bone-flap under local anesthesia, an experience deflicult for a debilitated and often elderly patient to bear and while successful in the hands of the surgeon devising the operation in the experience of the writer has proved ineffective in the elimination of true in the face even when carried out bilaterally

The contention made that direct intervention into the pain-conduction system is superior to rehance upon elevation of the pain threshold by the administration of analgesics cannot be emphaauxed too strongly Many physicians feel reluctant to consider neurosurgical procedures in cases of intractable pain because of the obvious limita tion of the patients life by the fundamental pathologic process and because these cases seem to be such poor surgical risks. Each one of us has seen an individual tortured by an invasive carcmoma live far beyond the span of life allotted by the most sapient prognostician While neurosurgeons believe themselves to be as cautious and conservative as other surgical specialists, we are more accustomed perhaps to operating under adverse circumstances For these among other reasons, the sufferer should be given the benefit of consultation with the anesthesiologist and neuro-Proper cooperation between the two may do much to render the existence of this indi vidual bearable and even profitable once again

#### Summary

- The anesthetist should be concerned with the treatment of pain throughout the field of medicine
- Pain clinics should be set up for the orranged study of pain relief and the establishment of effective routines. They should be based on teamwork between anesthetist and neurosurgeon

Intravenous morphia is indicated for relief of acute pain

- Sympathetic nerve block should be used for severe vasospasm Included in this group of cases should be pulmonary embolism, persistent coronary spasm, anuma pancreatitis and throm bophlebitis
- Ammonium sulfate should be used in nerve block for chronic pain where important motor function is controlled by contiguous nerves.
- A catheter technic for the subarachnoid in section of alcohol is described
- The role of neurosurgery in the management of pain is outlined

## DIFFERENTIAL SEGMENTAL SUBARACHNOID BLOCK A DIAGNOSTIC TEST FOR HYPERTENSION

B ETSTEN, MD, and W SCHWAB, MD, Albany, New York

(From the Department of Anesthesiology, Albany Hospital and Albany Medical College)

HERE are many causes of and diseases Associated with hypertension in man classified fifty of these causes and condensed them into five groups (1) renal, (2) cerebral, (3) cardiovascular, (4) endocrine, and (5) un-Some of the mechanisms thought to be responsible in this last classification are primary vascular disease. (2) increased sympathetic outflow from the cerebral cortex, and, (3) the presence of an angiospastic humoral substance

The surgical treatment of this unknown group, which comprises the greatest number of hypertensive patients, has received widespread attention in the past ten years. The surgery is primarrly intended to interrupt the sympathetic influences to the splanchnic and peripheral vessels Thoracolumbar sympathectomy is considered to be successful if it can produce a significant reduction in arterial blood pressure, relief in general disability, and improvement of evegrounds. cardiac, and renal function

White and Smithwick,2 Grimson,3 and Lord and Hinton strongly advocate thoracolumbar sympathectomy for hypertension Grimson<sup>3</sup> feels that this applies particularly to the neurogenic group and that more of the sympathetic chain has to be removed than is done in splanchnicectomy to abolish the postoperative fluctuations of arterial pressure Lord and Hinton and Smithwick have repeatedly reported the necessity of extirpating the sympathetic chain beyond the innervation of the splanchnic nerves

Numerous tests6-9 have been advocated for the selection of the hypertensive patient for surgery Methods have been proposed as a guide for the extent of sympathetic ganglionic resection, for example, the continuous caudal first suggested as a diagnostic method in 1945, and it was an attempt to indicate the effect of sympathetic depression at various levels upon the arterial tension. This procedure as described by Russek and Southworth<sup>10</sup> is not applicable to all With this technic the uncontrollable, rapid ascent of sympathetic depression from the tenth to the second dorsal segment, plus a concomitant muscular flaccidity, may be additional

Presented at the 141st Annual Meeting of the Medical Society of the State of New York, Section on Anesthesiology May 7 1947 Buffalo We wish to acknowledge gratefully the encouragement and assistance of Dr E H Campbell

high percentage of patients technical difficulties are often encountered because of abnormalities of the sacrum It is apparent that these procedures do not serve as an accurate guide to the surgeon. nor do they faultlessly evaluate the vasomotor activity of the patient

factors in the lowering of the blood pressure. In a

The purpose of this paper is to propose a subarachnoid sympathetic block, which will depress selectively and segmentally the vasoconstrictor fibers This test is not meant to serve as the only measure in evaluating the operability of the hypertensive patient, but as a means to determine the extent of resection of the sympathetic chain to produce a successful therapeutic result

## Method

The patient, not premedicated, is brought into a room heated to 90 F A lumbar puncture is performed between the third and fourth lumbar interspaces and set up for the fractional method of subarachnoid injection as described by Lemmon 11 The patient is then placed in the supine position and the intrathecal introduction of the drug is withheld until the completion of the control observations The control period consists of arterial blood pressure and pulse readings every five minutes over a period of one hour, or until the blood pressure is stabilized

The sensory dermatomes are mapped out with skin pencil over the entire body as described by Foerster 12 Regions within each dermatome also are outlined in order to confine the repeated examinations to a specific area The neurologic examination consists of appreciation or loss of pain, cold, heat, vibratory sense, and the degree of motor function of the legs Finally, the electric skin resistance is measured over the outlined sensory areas of the body with a dermometer, according to the method of Richter and Woodruff 13 14

After the completion of the control period, 5 cc quantities of a 0 4 per cent concentration of procame in distilled water are barbotaged at four-minute intervals into the subarachnoid space arterial blood pressure, pulse rate, and neurologic examinations are recorded every four minutes during the entire test When the sensory level of analgesia and level of sympathetic block reach the first dorsal segment, or, in the event of a significant hypotension, the test is concluded

The room is heated to produce an increased activity of all the sweat glands. This, in turn causes a uniform pattern of electric skin resustance over the entire body during the control period. In the surgical or functionally sympathectomized areas the sweat glands are inactive and this phenomena increases the electric skin resistance.<sup>12</sup>

#### Results

October 1 19471

Twenty four hypertensive patients selected as perspective candidates for thoracolumbar sympa theetomy were studied thoroughly by the departments of medicine and neurosurgery. After the completion of all other laboratory tests, these patients were referred to the department of anesthesiology for further evaluation by means of the differential segmental sympathetic block as was outlined previously. The effect of this test upon the functional activity of the sympathetic nervous system was determined qualitatively by the measurements of electric skin resistance. The onset of skin hypalgena and analgena was recorded at each dermatome and correlated with the arterial blood pressure.

These observations revealed that the levels of sympathetic block paralleled the level of skin analgesia, and that the depression of the activity of the sympathetic fibers followed from two to fifteen minutes after the onset of skin analgesia. In several instances there was a slight impairment of motor function of the lower extremities. In all the other cases there was no evidence of anosthetic depression of the motor nerves.

The results of this series of patients fell into three distinct groups Group I—no fall in ar terial pressure Group II—significant drop and Group III—moderate drop A significant lowering of the arterial blood pressure was judged to occur when the diastolic blood pressure fell to 100 mm Hg or less, along with a corresponding fall in the systolic measurement. When the systolic blood pressure fell appreciably, and the diastolic blook lightly or above 100, it was considered as a moderate drop. Table I illustrates the effect of this diagnostic measure upon the arterial tension at the various levels of sympathetic block. Five of the patients of Group II and one from Group I had bilateral thoracolumbar sympathectomies

TABLE 1 —EFFECT OF DIFFERENTIAL BYMPATRETIC BLOCK UPON THE BLOOD PREMEDER AT THE VARIOUS SYMPATRETIC LEVELS

Group	Blood Pressure	Sympathetic	Number of Patients
I	No drop	Up to T1	9
it A	Significant drop	From T10 to T6	2 5
ш о	Moderate drop	From T4 to T2 From T4 to T2	3

After reviewing the results, we noted with interest that it would have been possible to prophesy the postoperative course of the arterial blood pressure following thoracolumbar sympathectomy In several cases the sympathetic chain was excised several segments lower than what was determined by the test to be the optimum level The subsequent blood pressure was sustained within the same limits as obtained during the test at that particular seg mental level. In the other cases the resection of the sympathetic chain extended to the optimum level as indicated by the test. Again, the postoperative blood pressure readings fell to the same level as obtained during the block

The following case compares the results obtained by the differential segmental block with the sodium amytal test and the postoperative course

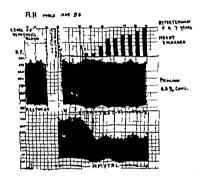

Fig. 1. This chart illustrates the comparison of the blood pressure obtained during the subarachnoid sympathetic block and the sodium amytal test.

Fig 1 illustrates the type of patient that fell into Group I The level of the sympathets block extended to the second thoracic segment Both the systolic and diastolic blood pressures were sustained throughout the entire diagnostic procedure, whereas a previous sodium amytal test produced a drop in systolic from 240 to 180 mm. Hg and the diastolic from 130 to 120 mm. Hg In other instances sodium amytal had no effect on the arternal tension and the differential segmental block produced a significant drop in blood pressure. We were not able to formulate any positive correlation between the sodium amytal test and the procedure that we report.

Figs 2 and 3 are graphs of the blood pressure in the resting state during the sympathetic block

and in the postoperative course.

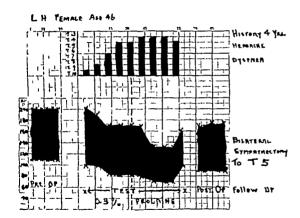

Fig. 2 This graph reveals the effect of the sympathetic block at the 5th thoracic segment upon the arterial blood pressure

In Fig 2 the sympathectomy extended to the fifth thoracic segment—Both the systolic and diastolic pressures are compared to that obtained during the test at the fifth thoracic segment as indicated by the dotted line—In this case the resting blood pressure of 200/110 dropped to 160/90, when the block reached T5—There was a further drop to 130/70, when the block reached T3—The postoperative blood pressure stabilized at 170/90

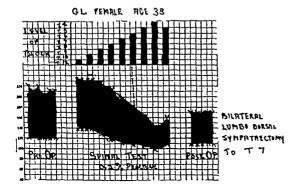

Fig. 3 The progressive decline in arterial blood pressure during the ascent of the sympathetic block is shown

In Fig 3 the resting blood pressure was 210/120 and fell to 180/110 when the segmental test reached the level of the sixth thoracic segment. When the block extended to the fourth sympathetic dermatome the blood pressure fell to 140/100. A bilateral thoracolumbar sympathetic ganglia and the postoperative blood pressure stabilized at 170/110. Here, again, the postoperative reading compared favorably with that obtained during the test, as indicated by a dotted line on the graph.

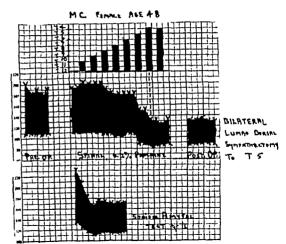

Fig 4 The blood pressures during the sodium amytal test and segmental sympathetic block and the bilateral thoracolumbar sympathectomy are compared

Fig 4 compares the blood pressure obtained during the sodium amytal test, the differential sympathetic block, and the postoperative period. This patient had a bilateral sympathectomy up to, and including, the fifth thoracic sympathetic ganglia.

During the sodium amytal test the blood pressure fell from 230/140 to 170/118 During the segmental spinal procedure the pressure dropped from 220/110 to 130/90 when the block reached the fourth thoracic dermatome The postoperative blood pressure of 130/90 again parallels that of the sympathetic block.

#### Discussion

The difference in susceptibility of the nerve fibers traversing the subarachnoid space to anesthetic drugs has been the subject of speculation for many years Tait and Caglieri15 demonstrated that weak concentrations of cocaine have a selective and preferential depressant action on the sensory nerves Heinbecker, Bishop, and O'Leary<sup>16</sup> reported that when a mixed nerve is infiltrated with a low concentration of procaine, the impulses carried by class C fibers are the first to disappear This work suggests that the phenomena applies to the smaller unmyelinated fibers which are found in both the sensory and sympathetic nerves Vehrs'17 clinical observations of controlled injections of low concentrations of procaine demonstrated the differential action of novocaine upon the sensory and sympathetic nerve fibers Sarnoff and Arrowood 18 have also produced a block of the sympathetic and sensory fibers without affecting the motor nerves Both Koster<sup>10</sup> <sup>20</sup> and Vehrs<sup>21</sup> have shown that from four to ten minutes after the initial subarachnoid injection of procaine the concentra-The above reports tion is greatly reduced formulated the basis for our use of weak concentrations of novocame the time interval between injections, and the method of administration of the drug

We have attempted to evaluate the effect of the intrathecal injection of procaine in low con centrations as a prognostic sympathetic block for patients with hypertension Repeated trials with 0 1 to 1 per cent processes were made. The volume of the drug that was injected at any one time varied from 1 to 8 cc. Subsequently it was found that 5 cc. of a 0.4 per cent solution of procaine injected every four minutes produced a more uniform action without suddenly "flooding," and depressing the upper dorsal nerve roots.

With our outlined technic it was possible to in terrupt the function of the vasoconstrictor fibers slowly and segmentally This, we feel, is very im portant, because sudden depression of a large part of the sympathetic chain will often produce a preapitous hypotension When the vasoconstructor activities of the sympathetic chain are depressed slowly, it is possible to correlate the resultant arternal blood pressure with the extent of the block. The determinations of the electric skin resistance by means of a dermometer verified the findings of Schumacher22 as to the level of the interruption of impulses of the sympathetic fibers

Admittedly, the number of operative cases are too few to evaluate conclusively the efficiency of this particular diagnostic procedure but we feel that it is highly suggestive as a valuable prognosto guide to the neurosurgeon

#### Summary

The intermittent intrathecal injection of concentrations of procaine ranging from 0.2 to 0.4 per cent over a period of an hour can produce a differential type of block. The sensory nerve roots and function of the sympathetic fibers are preferentially affected by this method

This paper is a preliminary report of a technic for evaluating the effect of sympathetic block on the arterial blood pressure of patients with hyper The functional depression of the sym pathetic chain was discerned by the measurement of electric skin resistance. The results of this test on 24 patients are reported

#### PNEUMONIA IMMUNIZATION OUTS DEATH RATE OF OLDER PERSONS

A group of New York investigators who made a six year study of pneumonia in elderly patients, suggest immunisation against the disease where high incidence rates prevail as in epidemics, in institu tions, and in persons with a tendency to recurring pneumonia

Writing in the current issue of the Archies of Internal Medicine published by the American Medical Association, the investigators—Paul Laufman M.D., attending physician, Goldwater Memorial Hospital and Now York City Home, C. O Brien, M.D. resident physician, and Il Stein M.D., resident physician, New York City Home—state that they undertook their study in the older age group for several reasons

First, they have a high incidence of pneumonia, mortality and case fatality rate. Second, repeated attacks of pneumonia occur frequently Third there was possibility for continuous observation, hospitalization and re-examination since the patients were from the New York City Home and the Medical Division of the former Central and Neurological Hospital and the Goldwater Memo-

rial Hospital where higher age groups are treated.

During the six year study 1937 to 1943 5 750
patients were immunized against pneumonia while 5 153 control patients were observed for comparison 5 153 control patents were observed for comparison Among the immunized group 90 developed pneumonia, an incidence rate of 17.2 per 1 000, of which 40 dfed, a mortality rate of 6.2 per 1 000. There were 227 cases of pneumonia among the nonlimmunized patients an incidence rate of 44 per 1,000 with 98 deaths, a mortality rate of 19 per 1 000. The antigen used in these experiments for immunization is made from a fraction of the pneumonia with experiments are consistent to comparison.

mococcus, the organism responsible for pneumonia. The antigen, which incites production by the body cells of a substance to fight the bactera, is a polysacchande.—American Medical Association News

# PHLEBITIS AND PULMONARY EMBOLISM FOLLOWING PENTOTHAL-SODIUM ANESTHESIA

HEBER H RYAN, JR, MD, and CURTISS B HICKCOX, MD, Philadelphia, Pennsylvania

(From the Department of Anesthesiology, Temple University Hospital and Medical School)

In THE thirteen years since its introduction into the clinical practice of anesthesiology pentothal-sodium has proved to be a drug which is relatively free from untoward effects. However, certain precautions must be taken at all times if one wishes to avoid complications and if the drug is to retain its popularity. The major complications such as laryngospasm, respiratory depression, extravenous injection of the drug, and trauma to nerves of the arm are well known, but reports of phlebitis followed by pulmonary embolism have not been found in the literature

When pentothal was first introduced the concentration suggested was a ten per cent solution of the drug Within two years there were reports of phlebitis at the site of injection of the drug even though there had been no extravenous injection Reports of extensive phlebitis following injection of pentothal-sodium in 5 per cent concentration have appeared in the British In one case it was thought that literature pooling of the pentothal in the arm vein due to the position of the patient on the operating table There was no was a strong etiologic factor mention of pulmonary embolism in these cases 1-3 There were also occasional reports of sloughing of superficial tissues when extravascular injection did occur 4,5 These complications led quickly to reduction of the concentration from a ten per cent to a five per cent solution of pentothal which was widely used for several years Even with this concentration an occasional case of phlebitis did occur, the incidence of which Adams set at about one in one thousand administrations • Subsequently, Lundy and his group suggested the more dilute 21/2 per cent solution of pentothal not only to make this anesthetic drug safer for general use but also to avoid these annoying complications 7 This two and a half per cent concentration has proved to be a safer one from the viewpoint of both physician and patient in regard to the incidence of these potentially serious complications

During the past year two unusual cases of phlebitis following injection of pentothal have come to our attention. In addition to the phlebitis there was venous thrombosis followed by pulmonary embolism. These cases occurred in different hospitals.

## Report of Cases

Case 1 -This apparently healthy 49-year-old man was operated upon for removal of a small lipoma of the left posterior chest wall on July 27, 1946 Pentothal-sodium in a two and one-half per cent concentration in distilled water was the sole anesthetic agent used The supine position with a sandbag under the left shoulder was employed during induction of anesthesia but for the surgical procedure the right lateral position was necessary Venapuncture was made without difficulty in the right arm. antecubital space A total of 18 cc (450 mg) of the anesthetic solution was given during the operation Anesthesia and surgery were uneventful, recovery was not prolonged and the patient was discharged to his home within a few hours of completion of the operation Shortly after regaining consciousness the patient noted a stinging sensation in the right arm about the site of injection of the pentothal. These symptoms progressed during the next eight days with pain and tenderness of the anterior surface of the right arm and shoulder

On the eighth postoperative day, August 4, 1946, there was sudden onset of severe, sharp pain in the right lower chest anteriorly This pain was accentuated by deep breathing, later there was reference of the pain to the right shoulder He was seen by a physician who administered morphine (16 mg) and atropine (04 mg) within an hour after the onset of pain Medication of this type was continued for the next twenty-four hours in an effort to relieve pain and prevent spasm of pulmonary ves-A cough, which was productive of moderate amounts of thick, bloody sputum, developed within a few hours after the onset of pain Temperature was 100 3 F orally There was marked shortness of breath Physical findings soon after onset of acute symptoms consisted of diminished breath sounds and a few scattered crepitant rales by auscultation over the right postero-lateral aspect of the chest On percussion there was dullness over the same region. Examination of the right arm revealed a thin, linear zone of tenderness extending from the antecubital space into the right axillary fold anteriorly and even into the supraclavicular area. There was redness and induration along the course of the involved vein beginning in the antecubital space and extending upward for approximately 12 cc Moderate redness but no edema or induration was present at the site of the venapuncture

This patient became acutely ill with a spiking temperature up to 102 F. A bedside roentgenographic examination of the chest made one day after the onset of symptoms, August 5, 1946, revealed a "triangular area of increased density in the lower lateral portion of the right lower lobe. The base of this triangular area was adjacent to the pleura. There

Presented by invitation at the 141st Annual Meeting of the Medical Society of State of New York Buffalo Section on Anesthesiology, May 7 1947

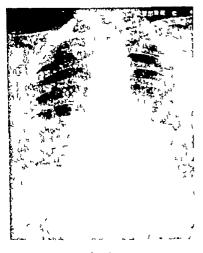

Fig 1

Fig 2

was some blunting of corresponding costophrenic angle with a small amount of fluid "These findings were considered to be suggestive of pulmonary infarction with associated pleuritic (Figs. 1 2)

A medical regimen of therapy was started using morphine and atropine as previously mentioned, penicillin prophylactically for pulmonary infection and anticoagulant drugs (heparin and dicumarol). The anticoagulant thorapy was continued for ten days and fever subsided gradually to normal in five days. The physical findings in the right arm disappeared during this time but the chest findings per sisted for approximately three weeks. After this time they disappeared gradually and recovery ensued without further incident.

Case 8 -A 47 year-old man was admitted to the hospital accident dispensary where a diagnosis of Barton a fracture of the right wrist was made July 25 1946 Treatment at that time consisted of encasement of the right arm in plaster from the midpalm to the midhumeral area. He returned four days later July 20 1946 for delayed reduction and fixa tion under fluoroscopic observation General anesthesia using pentothal-sodium in two and one-half per cent concentration was the only anesthetic agent recorded on the outpatient card but nitrous oxide and oxygen in equal concentration may have been administered No pre-anesthetic medication was used. The total amount of pentothal administered was not recorded. The operative procedure lasted thirty minutes and consisted of fixation of the fracture by means of pins and plaster cast. There was no difficulty in doing the venapuncture in the left antecubital space with the patient in the suping

position. Consciousness occurred soon after completion of the orthopedic procedure and the patient was discharged home within three hours. He later reported that there was some soreness at the site of injection of pentothal as soon as consciousness returned This continued extending up the left arm to the shoulder and persisted for the next thirty five days but no medical attention was sought. On the thirty fifth day September 2 1946 there was sud den onset of severe pain in the left lower chest accompanied by dyspnes and a mild cough. The latter was occasionally productive of small amounts of blood streaked mucus. He was admitted to the hospital three days after the enset of scute symptoms (September 5 1946) At this time physical examination revealed an acutely ill dyspneic patient with slight cyanosis. Temperature was 102 F There was limited motion of the left side of the chest many cropitant rales decreased breath sounds, and dullness to percussion on that side

There was marked tenderness of the left arm and shoulder and a thin linear zone of redness and in douration extended from the antecubital space to the axillary fold antenorly. Marked tenderness was found also in the left supraclavicular area sand surgical ligation of the involved vein was considered at that time to be contraindicated. There was a small area of redness about the original venapuncture atto but no edoma or induration was present.

Bedside v ray examination of the chest on the day of admission was unsatisfactory but did show areas of increased density in the bases of both lungs. However films taken five days later (September 10, 1946) showed increased density at both bases with a transgular area of consolidation extending from the heart border to the late.

Fig 3

Fra 4

on the left side The base of this triangle was at the lateral chest wall Some pleural reaction was noted at both bases" These findings were interpreted as showing multiple areas of infarction of the lungs with the greater involvement on the left side (Figs 3 4)

This patient was treated medically with anticoagulant drugs (heparin and dicumarol), penicillin prophylactically, and fluids by the intravenous route. Temperature spiked as high as 103 F but fell slowly to normal on the twelfth day of hospital care. Roentgenographic studies, three weeks after admission, showed "complete clearing of the right lung but there was still a large area of infarction at the left base"

The signs and symptoms in the left arm, shoulder, and clavicular area subsided in approximately fifteen days and the patient was discharged as improved twenty-three days after admission.

#### Discussion

A search of the literature has not revealed similar, serious complications even when the more concentrated solutions of pentothal were employed. The literature does reveal that phlebitis may occur rarely (1 in 3,000) when pentothal in two and a half per cent concentration is used but that it is usually a local reaction without further complications. Richards has reported that in experimental work local venous thrombosis is rare if the concentration of the pentothal solution when injected does not exceed two and a half per cent, but that concentrations between ten and

forty per cent can cause enough irritation of the intima of veins to produce thrombosis 8

In some hospitals the responsibility for preparing the stock solution of pentothal is placed upon one member of the anesthesia department However, in many other hospitals this responsibility is divided among staff anesthesiologists, residents, interns, and nurse technicians within the department. In the latter situation it is apparent that there is greater opportunity for error in preparation.

In the past year the authors have observed three stock bottles of pentothal-sodium solution in which the concentration of the drug at the top of the bottle varied considerably with that at the bottom These were tall bottles each of which contained 200 cc of sterile, distilled water and into which five grams of pentothal powder had been It was apparent that the bottles had not been shaken and that most of the pentothal remained in the lower half of the bottle in concentrated solution If one were to load a syringe by aspiration through a long needle which reached to the bottom of such a bottle, he would probably obtain a concentration of pentothal up to thirty or forty per cent Therefore, it is our feeling that the concentration of pentothal used in the above cases may have been in excess of two and a half per cent and may have been a causative factor for the phlebitis

#### Summary and Conclusions

- 1 Two cases of phlebitis and subsequent pul monary embolism following pentothal-sodium anesthesia have been presented
- 2 The incidence of phichits following pontothal anesthesia increases as higher concentrations of the anesthetic drug are employed
- 3 Varying concentrations of pentothal due to error in preparation of the stock solution have been observed

#### DE SENECTUTE

The lines "Gather ye rosebuds while ye may" and so forth, familiar to all of us are still appropriate in these days of longer life but of accolerated living. They are, moreover by one who knew his old ago Robert Herrick having put eighty two summers behind him oven in the seventeenth century when the average span of man's life was well under forty years

Not only has the duration of life nearly doubled since the over-ripe Herrick wrote his somewhat amorous lyrics, as a result, the average age of the populations of civilized countries has likewise steadily increased. The old, like the poor will definitely be with us, and we must look to the better care of the aging, if they are to enjoy the fullness of their years. We must put more emphasis on the last of Shakespears a seven periods of customes if we are to try and save the "lean and slipper'd pantaloon from

Sans teeth sans eyes, sans taste sans everything

This interest in the problems of the old is fortunately quickening here and abroad to the point where geriatros, caring for the tapering end of the life line has become as serious a specialty as has pediatrics for its beginning. It is wise to bear in mind that the sunset of man a life may have as vivid colors as its dawn, and he is much more conscious of it.

As Dr Roger I Lee has pointed out we have, by our care of the young permitted many more people to become elderly without doing much to make that increase in years any happler or even more endurable. One of our tasks is to make these added years for which most of us hope and which most of us dread more pleasant ones to anticipate and to attain.

The declining years of life should have their own activities and their own compensations and their own type of oversight. They require certain dictary limitations, as of fats and roughage, and certain dictary reinforcements, as of vitamins and even digestants. Indeed some of the proprietary firms are already promoting pap for the aged as well as pap for the young.

Age has its dignity, too often lost, let it also have its comfort, too often lacking. Let our second childhood at least share the consideration given our first. The enthusiastic lines of Rabbi Ben Erra

Grow old along with mel

The best is yet to be, The last of life, for which the first was made,

particularly appropriate for a geriatric alogan hold a promise that is still not always fulfilled, but offers a target at which to shoot.—Educrial New England Journal of Medicine. June 3 1947

## PREPARING FOR WORLD CITIZENSHIP THEME OF 38TH MEETING OF NATIONAL COMMITTEE FOR MENTAL HYGIENE

The 38th annual meeting of the National Committee for Mental Hygiene will be held on Wednesday and Thursday November 12 and 13 1947 at the Hotel Pennsylvania, New York City Dr Georga S Botvenson medical director has announced. The two-day program will be devoted to mental hygiene issues in Preparing for World Citizenship as suggested in the preamble to the Constitution of the United Nations Educational Scientific and Cultural Organization which reads ince wars begin in

the minds of men, it is in the minds of men that the defenses of peace must be constructed.

The Lasker Award for this year's most significant contribution to popular adult education especially in parent-child relationships, will be presented at the annual luncheon meeting. November 13 An address will be given at this time on the responsibilities and opportunities of citizens and mental hygiene or ganizations in the states in terms of immediate issues to be faced.

## BRAIN TUMOR SIMULATING PURULENT MENINGITIS

Emanuel Appelbaum, M D , Jane W Norman, M D , and Jobl J Brenner M D , New York City

(From the Fourth Medical and the Neurological Divisions, Bellevue Hospital, and the Bureau of Laboratories, Health Department)

THE symptomatology of brain tumor is in certain respects similar to that of meningitis. Headache, vomiting, and a change in the mental state are symptoms common to both diseases. Even the important meningitic signs of fever and nuchal rigidity occasionally may be encountered in cases of cerebral neoplasm. It is not generally known, however, that in rare instances of brain tumor the spinal fluid may actually become purulent in character. The case about to be cited illustrates this important phenomenon.

### Case Report

History—P J, a man, aged 55, was admitted to Bellevue Hospital on March 11, 1946, complaining of severe frontal headache and pain in the back of the neck of two weeks' duration—Two days before admission the patient experienced some chilly sensations—Because of the patient's mental state it was not possible to obtain any further information

Physical Examination —On admission the patient was semistuporous but responded to commands and answered questions slowly He appeared acutely and seriously ill but was not in respiratory distress. The temperature was 101 F, the pulse 58, and the respirations 24 The blood pressure was 122 systolic and 72 diastolic No abnormal findings were noted. in his nose, ears, or pharynx Except for moderate suppression of the breath sounds in the upper half of the left lung there was no evidence of pulmonary disease There was a brady cardia but in other respects the heart was normal The abdomen was soft and the spleen was not felt. There was generalized muscular spasticity A slight left facial paresis, involving the lower two-thirds of the face, was noted A slight left facial paresis, Definite paresis of the extremities could not be made out, but when the arms were stretched forward there was drifting on the left side There was marked nuchal rigidity and positive Brudzinski and Kernig The right pupil was larger than the left, and easted to light and in accommodation. The both reacted to light and in accommodation deep and superficial reflexes were preserved, but the left abdominals appeared to be diminished. The left abdominals appeared to be diminished Babinski and confirmatories were all negative The fundi showed some narrowing and tortuosity of the vessels with increased light reflex but clear disks

Laboratory Data —The red blood count was 3,510,000 with 117 Gm of hemoglobin and the white blood count was 10,800 with 76 per cent polymorphonuclears. The urine showed 1 plus albumin but no other abnormal findings. The blood nonprotein nitrogen was 35 and the sugar 87 mg per 100 cc. A Wassermann test was negative. The spinal fluid was turbid and showed a large number of cells, 98 per cent polymorphonuclears, a protein of 320 mg, a sugar of 44 mg per 100 cc, and no organisms by smear or culture.

Presented at the New York Academy of Medicine Graduate Fortnight, Bellevue Hospital Clinic New York City October 15 1946

lungs and some thickening of the mucous membrane

of both ethmoids and the right antrum.

Treatment and Course—When a turbid spinal fluid was obtained a diagnosis of some form of purulent meningitis seemed warranted and intensive penicillin therapy was instituted immediately. The regimen consisted of a daily intrathecal injection of 200,000 units of penicillin and of intramuscular injections of 50,000 units of the antibiotic at three-hour intervals. This treatment was continued for about a week but it did not result in any improvement in the patient's condition. The semistuporous state persisted and the abnormal neurologic signs became somewhat more pronounced. In addition, he exhibited occasionally jactitatory movements in his left arm and left leg.

On March 15, the fifth day of admission, there was further progression of the pathologic signs. Particularly striking at this time were the fundus changes, which showed engorgement of the vessels and bilateral papilledema. As shown in the accompanying table, the spinal fluid findings remained essentially unchanged. The cells were too numerous to count and were predominantly polymorphonuclears. It is important to note that all the spinal fluids showed a normal sugar content and no organisms by smear or culture.

It soon became apparent that the clinical picture was not that of bacterial meningitis but rather of a reactive or sympathetic meningitis, secondary to some focal intracranial disease, probably a brain absecss in the right temporal lobe. The patient was transferred therefore to the Neurological Service

On March 19, ventriculography was performed through a trephine hole on the right side of the skull. The dura was tense and the brain herniated through the burr-hole Exploratory puncture of the right temporal lobe yielded a yellowish fluid. The ventriculogram (Fig. 1) revealed moderate aeration of the left lateral ventricle with moderate dilatation of the anterior and posterior horns. The left anterior horn was displaced to the left by a mass in the right anterior cerebral area. The third ventricle was markedly displaced to the left. The right lateral ventricle was not definitely visualized. There were quadrangular defects in the right parieto-temporal and frontal regions (burr-holes).

On March 20, a craniotomy was done and yellow-

On March 20, a craniotomy was done and yellowish gelatinous tissue, resembling in the gross glioblastoma multiforme, was removed from the medial portion of the right temporal lobe. The bone flap was left open for decompression. Following the operation the patient received a course of radiation therapy. For a while some improvement was noted in his condition, evidenced by a lessening of the stuporous state and a decrease in the papilledems. Soon, however, the severity of the symptoms in creased and the disease progressed to a fatal issue.

creased and the disease progressed to a fatal issue

Pathologic Report — Dr Lewis D Stevenson, the
neuropathologist, submitted the following report on
the microscopic examination of the tissue removed at
operation Tissue shows packed tumor cells rela-

2107

Fig 1 Ventriculogram shows the changes described in the text

Fig 2 Tumor tissue Section shows packed tumor cells relatively well-preserved with areas of necrotic cells (× 220)

tively w.ll-preserved with large areas of necrotic cells (Fig 2) There are many thick walled blood cossels, some entirely occluded by the thickening of the wall and some with the wall invaded by tumor tissue (Fig 3) The tumor cells appear to be sponguoliasts, of varying size and shape. Many plump astrocytes are present. There are some multinucleated forms, although these are not conspicuously large or numerous. Mitotic figures are not seen. The tumor should probably be classified as sponguo-blastoms multiforme

#### Comment

The patient's failure to respond to intensive penicillin therapy and the progression of the focal signs and of the papillodema within a relatively short time led us to suspect the presence of a brain abscess Furthermore the repeated spinal fluid examinations showing on each occasion a normal sugar and absence of organisms convinced us that the patient had a meningitis sympathica, secondary to focal intracranial disease. The presence in the right cerebral area of a space-occupying lesion was confirmed by the ventriculogram. However the finding of a brain tumor instead of an abscess was somewhat of a surprise

This case shows how meningitis sympathics may at times cause confusion in diagnosis, particularly if the meningeal reaction is pronounced. This condition is found in connection with brain abscess inflammation of the various sinuses of its media, mattoldits and on rare occasions it is associated

Fig. 3 Tumor tissue—Section shows thick walled blood vessels (× 135)

TABLE 1 - SPINAL FLUID FINDINGS

Date 3-11-46 3 12-46 3 13-46 3-15-46 3-16-46 3 19-46	Appearance Turbid Turbid Turbid Turbid Turbid Turbid Turbid	Cells  Large number polynuclears   Smear Negative Negative Negative Negative Negative Negative	Culture Negative Negative Negative Negative Negative Negative	Protein Mg % 320 203 146 167 165 192	Sugar Mg % 44 56 57 51 57 54

with brain tumor The typical symptoms of meningitis are usually present The spinal fluid is increased in amount, is hazy or turbid in appearance, shows an increase in polymorphonuclear cells and in protein, and a normal sugar. It is invariably negative for organisms Repeated spinal fluid examinations may be necessary before one can be sure that the condition is not an early stage of bacterial meningitis

In this connection it is necessary to point out that

meningitis sympathica secondary to brain tumor is rarely as severe as that encountered in our case However, the meningeal reaction associated with spongioblastoma multiforme may be marked because of the rapid growth of these tumors and their tendency to undergo necrosis

Note We wish to express our gratitude to Dr Foster Kennedy, director of the Neurological Division Bellevue Hospital for permission to report this case and to the Neuro-pathological Department, Bellevue Hospital for the use of the photomicrographs of the brain tumor

## SURGEON SAYS CANCER CLINICS HOLD KEY TO CANCER PROBLEM

Cancer of the stomach, which "strikes fear into the hearts of patients," is the most frequent of all malignant growths, according to Owen H Wangensteen, MD, from the Department of Surgery and the Graduate School of the University of Minnesota, at Minneapolis

Writing in the August 2 issue of the Journal of the American Medical Association, Dr Wangensteen says that in the light of present-day knowledge surgery is the only worth-while treatment for patients with gastric cancer, adding that "the most radical surgery with the lowest mortality is the best surgery "

In his article, entitled "The Problem of Gastric Cancer," Dr Wangensteen cites these conclusions

Only six per cent of the patients whose disease is diagnosed as gastric cancer are alive five years later

Only 25 per cent of the patients who have gistric cancer are suitable candidates for a curative type of operation

Gastric cancer is curable, but the problem is to recognize the presence of the disease in time, so that patients will not be denied the real hope that timely and well performed surgical intervention holds out to sufferers from gastric cancer

The death rate for cancer of the stomach is high in almost all countries, and deaths from gastric cancer comprise from 25 to 40 per cent of all cancer deaths

Deaths from cancer in this country rank only next to cardiac disease as the most frequent cause of death, and of the 150,000 annual deaths from cancer in the United States, approximately 40,000 persons die of gastric cancer

New Hampshire, with 30 3 per cent of its people above 45, has an annual cancer mortality rate of 155 4 per 100,000, the highest in the United States

X-rays, discovered in 1895, have since become the most reliable means of diagnosing gastric cancer

Autopsy figures suggest that in men over 20, six per cent of all deaths are due to gastric cancer, and in men between 50 and 70 years, 88 per cent are caused by gastric cancer

In women, 4 3 per cent of deaths at autopsy in patients over 20 years of age are due to gastric cancer, and five per cent of all deaths in women be-

tween 40 and 70 years are caused by this disease.

"The establishment of Cancer Detection Clinics, staffed by specialists, affords the best promise of the early recognition of cancer Women over 40 and men past 50 should report regularly to such clinics

"The solution of a difficult problem such as this demands the following

Members of the medical profession must look at the problem realistically and learn to know all the facts bearing on it

They must constantly enlarge their knowledge of the held by vigorous research and clinical investigation

All available resources must be combined to lend pursuit of the inquiry the greatest promise of solution

The solution of the problem must envisage an interest in the problem as it relates to the present generation as well as to those yet unborn."

## THE AMERICAN COLLEGE OF PHYSICIANS ANNOUNCES ITS ANNUAL SESSION

The American College of Physicians will conduct its 29th Annual Session at San Francisco April 19 to 23, 1948 General headquarters will be at the Civic Auditorium Dr William J Kerr and Dr Ernest H Falconer, both of San Francisco, are the co-chairmen for local arrangements and the program of clinics and panel discussions president of the college, Dr Hugh J Morgan,

professor of medicine at Vanderbilt University School of Medicine, Nashville, Tennessee, is in charge of the program of morning lectures and afternoon general sessions

Secretaries of medical societies are especially asked to note these dates and, in arranging meeting dates of their societies, to avoid conflicts with the College Meeting, for obvious mutual benefits

#### PALLIATIVE SURGERY FOR ADVANCED GASTROINTESTINAL CAR CINOMA IN ELDERLY INDIVIDUALS

WILLIAM SHEINTELD, M.D. Brooklyn, New York

(From the Surgical Sermee of the Coney Island Hospital)

YTENSIVE recoplasms of the stomach or colon are encountered from time to time in elderly patients. The size of the lesion and the patient s age discourage surgical intervention and a laisses fore attitude is often adopted by the physician or Frequently however the poor risk pa tient, after suitable preparation will withstand major surgery of considerable magnitude with amusing resistance and large lesions will prove to be resectable The patient will spend the remaining time of life in relative comfort and freedom from pain and life may be considerably prolonged as well

Extensive scirrhous carcinomas of the stomach and some very large rareinomas of the colon are often free of distant metastases. High subtotal gastrectomy well outside the lesion total gastreetomy, or colectomy will well reward the surgical effort by the palliation effected. In the absence of clinical and x ray evidence of metastases exploration should be performed. Operative confirmation of localization of the legion should be followed by radical operation. The size of the neoplasm and the age of the patient per se should not be deterrent

factora.

Case 1 -H F a white man 75 years old was admitted on October 22 1946 to the surgical service of the Coney Island Hospital The essential facts in the history are as follows There had been increasing constipation for six months. In the six weeks before hospitalisation he had numerous cpisodes of periumbilical pain. The appetite had become impaired but nausen and vomiting were absent. There was considerable weight loss

The physical examination showed an old man with a waxen pallor to his skin and a recent loss of The mucous membranes of the mouth and conjuctivae were pale. A mass of indefinite size which moved with respiration was palpable to the loft of the opigastrium A small umbilical hernia was present. The liver and spleen could not be felt Rectal examination was essentially nega-tive There was no adenopathy in the neck or elsewhere. The cardiovascular and respiratory systems

were normal for his age blood pressure was 130/00 ray studies were made, and a barium onema and chest x-ray were negative. A gustrointestinal series revealed a large tumor mass occupying the stomach from the pylorus to the cardiac region. The pylorus was patent (Fig. 1) The diagnosis

was gastric malignancy.

Laboratory Data.—The electrocardiogram was executially negative. The blood protein was 5.8 Gm per cent albumin was 3.0 Gm globulm was 1.7 Gm. hemoglobin was less than 7.6 Gm red blood count, 2.050 000 and white blood count, 8.200 hematocrit was 20 or cont. blood sugar was 100 mg. hematocrit was 20 per cent, blood sugar was 100 mg.

and the blood urea was 14 mg/100 cc.

The patient was prepared for operation. Several transfusions daily administration of intravenous amigen-dextrose solution and gastric lavage with dilute hydrochloric acid solution were carried out The Lited Acid Company of the blood protein was raised to 6 3 Gm./100 cc

Fra. 1

hemoglobin was raised to 8 Gm., and red blood count was raised to 2,960 000 on the day before operation.

On November 18, 1946 an operation was per formed (W.S.) under fractional spinal anesthesis using pontocaine supplemented with intravenous sodium pentothal sufficient to keep the patient sleeping. Blood transfusion and intravenous glucose and saline were given throughout. With the exception of a few glands along the lesser and greater curva tures no other metastases were noted. The lesion involved the greater portion of the stomach from the fundus down to the pylorus However a small portion of stomach adjacent to the cardia was uninvolved and sufficiently away from the lesion to make high subtotal resection possible

A high subtotal gastrectomy and omentumectomy with anterior gastrojejunostomy was performed The operation was well telerated and postoperative recovery was essentially uneventful. The patient s general condition improved markedly in the postoperative period. His appetite returned and he developed a sense of well-bring. At the time of discharge from the hospital December 10 1046, the hemoglobin was 11.5 Gm. and the red blood count Fig. 2 shows the gross specimen re-The pathologic diagnosis revealed a diffuse carcinoma of the stomach limits plastica type. had been getting attacks of pain in the right lower quadrant of the abdomen The pain was greatest after meals and associated with nausea There was some relief with passage of flatus For two weeks the stools had been tarry Marked asthenia and dizziness were present for several days before ad-Two years before an appendectomy had been performed

On examining the abdomen a large tender mass occupying the greater part of the right side of the abdomen was palpated It was spherical and roughly the size of a human head There was partial fixation No clinical evidence of metastases was present The patient's general condition was

Laboratory data revealed the blood sugar to be 89 mg/100 cc, urea 15 mg/100 cc, Wassermann was negative, hemoglobin was 74 per cent, there were 3,730,000 red blood cells and 8,600 white blood cells per cu mm., blood pressure was 118/70 barium enema was given on October 14, 1945, and the entire colon filled to the hepatic flexure at which level there was complete obstruction to the barium. There was some distention of the cecum and ascending colon with a suggestion of a mass in this area

The diagnosis was a tumor of the colon Preparations for operation were made and on October 15, 1945, a laparotomy under fractional spinal anesthesia was performed (WS) Numerous adhesions between the peritoneum, the small intestine, and omentum due to the previous appendectomy,

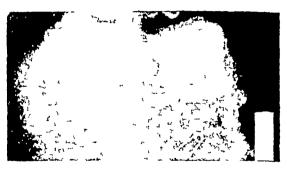

Fig. 3

The cecum and ascending colon were separated were greatly dilated and there was moderate dilatation of the terminal ileum. A huge mass was pal-This was fixed to m There was no pated at the hepatic flexure the lateral-posterior peritoneum gross evidence of metastases Resection of the terminal ileum, right colon, and part of the transverse colon was performed, the peritoneum attached to the mass being taken with it terminal ileum and transverse colon were then brought out in the upper part of the wound as a double barrelled colostomy, a long spur attaching the two segments Recovery was uneventful The spur was subsequently crushed and the colostomy closed extra peritoneally on November 9, 1945 patient was discharged from the hospital on December 1, 1945

The specimen consisted of a large fungating mass occupying the upper portion of the ascending colon and the hepatic flexure. It was about the largest single primary lesion of its kind in the experience of the laboratory. The histologic diagnosis was adenocarcinoma

The patient was seen one year after operation He was in good health and physical examination was essentially negative

## Comment

The scope of surgical endeavor is gradually being extended to include many operative risks previously Total gastrectomy for extensive stomach lesions is now a standardized procedure 1 Likewise, many intestinal lesions are now considered operable which formerly were thought to be too formidable The immediate results in both cases presented are of course gratifying Even if the palliation in the gastric cases is of short duration much is gained over the previous fate of starvation and its attendant nutritional edema Patients over seventy, if in fairly decent general condition, should be given the same opportunity as younger people

#### SIMPLE ARITHMETIC

He was only six years old and he had a very sore throat which was being treated with penicillin lozenges

"Doctor, your lozenges hurt my mouth you any that aren't so strong?"

"No sonny, they only make them one strength"
"That's silly," he replied
"They could easily make halfpennycillin lozenges, couldn't they?"—The Lancet, June 28,

#### CONFERENCES ON THERAPY

Departments of Pharmacology and Medicine Cornell University Medical College
and the New York Hospital

THESE are stenographic reports of conferences by the members of the Departments of Pharmacology and of Medicane of Cornell University Medical College and New York Hospital with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital students, and visitors. A selected group of these conferences is published in an annual volume Cornell Conferences on Therapy by the Macmillan Company The next Conference will annual volume the December 1 issue.

#### The Management of Peptic Ulcer with Protein Hydrolysates

Dr. Thomas P Almy About two years ago, we had the pleasure of listening to a symposium on peptic ulcer We heard from a medical man who recommended surgery in the management of ulcer We heard from a surgeon who recom mended conservative medical management also heard from a person high in the councils of surgical research who recommended a nutrition program for the treatment of ulcer We carried away from this symposium not only a wealth of understanding of the problem of ulcer which we did not have before, but also a feeling that the approaches to the therapeutic problem were being broadened. The principal speaker this afternoon has described a new concept in the management of peptic ulcer Dr Frank Co Tui, of New York University College of Medi cine will describe his method of treatment of ulcer by hyperalimentation and the use of protein hydrolysates.

DR FRANK Co Tui It was in the course of preparing patients with peptic ulcer for operation, usually gastrio resection that we gave them protein hydrolysates in order to build them up In 4 patients, the pain subsided and a gain in weight took place. The results were so striking that we thought we accidentally had unearthed an important discovery. We then tried it in 30 hospitalized patients who were intractable to the Sippy treatment or to amphoeel with or without antispasmotics. The patients were not on complete bed rest but were allowed to be up and about. We put them on the system of hy peralimentation. This consisted of 0.6 Gm. of nitrogen per KL, in the form of protein hydroly sate in addition to enough carbohydrate to make a total of 50 calories per kg In accordance with this formula, a 70-Kg man received 3 500 calories a day Since the hydrolysate which we used contained 12 per cent nitrogen such a pa tient received approximately 350 Gm. of hy drolysate representing about 1,400 calories The balance of the calories was made up by about 300 Gm of a sugar such as dextrimations. In this series of cases, pain either subsided or markedly dimnished within forty-eight hours. There was prompt gain in weight of as much as a pound a day and there was a feeling of well-being. We also thought there was x my evidence of early healing. Upon discharge, one half of the patients continued dietary precautions and the others did not. We soon learned that the treat ment did not prevent recurrences for of those that followed no subsequent dietary precautions, 4 patients had a recurrence in three months. Therefore this treatment seemed to be no better than other types in proventing recurrences.

We published the early results. The newspaper and radio fraternity who incidentally suffer notoriously from peptic ulcers took up the matter and inflated it into a scientific achievement of the first order Patients queued in front of the laboratory Fortunately I had to go to China, and I thought that was a way out of an embarassing situation but whether it was in San Francisco or Shanghai or Chungking the peptic ulcer patients were always there. I relate this story as a warning against the risk of having one's work overpublicized It did how ever accomplish something. It made available to us a large number of intractable cases of ulcer They seemed to have come out of hiding from physicians and surgeons, hiding in despair They came from all quarters of the globe, and this has given us an opportunity to test the regi men in more than 200 ambulatory patients

In the usual plan, the daily diet consists of protein hydrolysate and dextrimalities dissolved in water the total amount containing about 350 Gm. of hydrolysate and about 500 Gm of the sugar is divided into 8 equal feedings, usually taken at 2-hour intervals, at 8 00 10 00 12 00 2 00 4 00 0 00 8 00 and 10 00 If the pain recurs before the next feeding the intervals are shortened to 1½ or even one hour. These feedings are continued for two weeks after the pain subsides. In 95 per cent of the cases the patient

is free of the pain after the first twenty-four to forty-eight hours. On the fifteenth pain-free day, the patient receives a bland breakfast (an unfried egg, cereal, and toast) followed by the hydrolysate-sugar feedings every two hours. If there has been no pain, the patient receives supper (well-boiled meat, mashed potatoes, toast, and ice cream). If the meals on this day caused no trouble, the diet is extended to three meals on the following day, the sixteenth painfree day. This, together with five hydrolysate-sugar feedings at intervals of two hours, is continued for two months.

2112

I should like to emphasize that the details of these schedules were arrived at empirically and are subject to variation and improvement. It may be that somewhat smaller amounts of hydrolysates will do. It may be also that the treatment can be terminated in a month or should be extended to as long as six months.

We have used three kinds of hydrolysates with similar results. Some are better than others. A patient unable to tolerate one may be switched to another hydrolysate

To what do we assign the improvement in these cases? We have thought of four possible explanations, none of which is proved the fact that the hydrolysates, being amino acids and peptides, are amphoteric, and neutralize the hydrochloric acid We have shown that, when 50 Gm of the hydrolysate mixture is added to gastric contents with a pH of about 24, the pH rises to 46, and stays that way for about two The administration of a highly nutritious substance may promote the repair of wounds This is also a possible explanation, but very difficult to prove There is some indication that a high blood level of amino acids may cause relaxation of pyloric spasm, since pain may be relieved by their intravenous injection, but the effect of amino acids on gastric and intestinal motility has not been established Then there are the experiments indicating that amino acids may bind pepsin and thereby prevent its action Although this factor has not been studied sufficiently, it remains one of the possible explanations for the mode of action of the hydrolysates These are all merely suggestions They all may be incorrect

From the practical standpoint, the course of peptic ulcer may be divided into three stages first, the stage of acute symptoms, second, the stage in which symptoms have subsided but the ulcer has not healed, third, the stage in which the ulcer is healed. There still remains the problem of recurrence. We are quite sure of the efficacy of the treatment in the first stage, namely, the relief of the symptoms. We do not know how effective it will prove to be in the prevention of

recurrences We know of cases with premonitors symptoms of recurrence in which retreatment for a week checked the symptoms and prevented the recurrence. Obviously, there are many unknown factors promoting the chronicity and recurrence of ulcers. It is possible that a psychosomatic condition or a poor nutrition state may keep them from healing, and that the cycle may be broken by correcting one or the other.

DR ALMY Are there any questions for Dr Co Tin?

DR SEYMOUR H RINZLER The taste of the amino acid digest is a practical problem. How do you overcome it? Most of the materials on the market now have a very bad taste.

DR Co Tui The taste of the hydrolysates is very unpleasant to the normal person, but fortunately, from our point of view, a patient who has had ulcers for five or six years will take anything for relief. The first three days are the most critical ones. After that, patients may even get to like the material. I wish to state, in regard to the taste, that some preparations are better than others.

INTERN Do you make any provisions for vitamins during the period of two or three weeks in which the patients receive only the hydroly-sate-sugar feedings?

DR Co Tui After the first week, we give a full complement of vitamins daily Recently, a patient developed swollen gums on the ninth day of treatment There was a suspicion of scurvy The swelling subsided after vitamin C

DR WALTER MODELL Do all patients gain weight on the hydrolysate-sugar diet?

DR Co Tui Many do, about 50 per cent

DR. HARRY GOLD Would not treatment by the intravenous route serve to distinguish the local from the systemic aspects of the therapy?

DR Co Tui We are able to control the pain by intravenous injection However, it is almost impossible to administer the full caloric and introgen allotment of our hyperalimentation regimen by the intravenous route. You have to give too much fluid

DR GOLD I wonder whether Dr Co Tui has any notion as to what part of the 40 Gm of nitrogen given to an average person in this regimen is really necessary? That is what he happened to find satisfactory in early experiments, and it is understandable that he has continued such doses. Would it be safe to say that 20 Gm of nitrogen might conceivably do just as well, in which case one could give it by intravenous injection?

DR. Co Tul The neutralization of gastric acid with the amount of hydrolysate we use persists for about two hours. With less, it will not last as long. With the amount of feeding

we give, many patients still feel hungry, so that our does cannot be far above the critical one in most cases

Visitor Since Dr Co Tui feeds these patients large amounts of protein hydrolysates with the idea of promoting healing of the ulcer, does be have any data on the blood protein levels before and after treatment?

Dr. Co Tur We gave high protein feeding on a purely empirical basis and not because of an observed effect on the blood protein level all know Charles Lamb's story of the Chinese boy whose house burned down and with it his pig He touched the pig, got his fingers scorched, then reflexly put his fingers in his mouth and found that the taste was good Thereafter. whenever he wanted to have roast pig he burned his house down There is in this an analogy to our treatment We found that 0 6 Gm. of nitrogen did the work and we have continued it We do know, however that in about 20 per cent of the cases, the blood proteins are at the lower limit of normal, about 5.8 Gm per 100 cc

Dn. Modell. In patients with peptic ulcer is there any evidence that there is an inherent difficulty in absorbing or utilizing protein when given in its natural form and not as a hydrolysate?

Dr. Co Tu: We have no indication of that I should, however, like to call attention to an other point, namely, that in patients with pyloric obstruction, the hydrolysate relieves the obstruction We studied 6 patients with partial obstruction, 3 with a complete obstruction through which not even water passed, and lately 2 additional patients with complete pyloric obstruction due to carcinoma of the pylorus these the hydrolysate was able to pass when it was given in small doses, about 0.2 Gm. of nitrogen per Ivg which is approximately what we take normally in a high protein diet. It was an amazing experience. We may be certain that in many cases of pylone obstruction with an organic lesson super added spasm also may play an important role. Hydrolysate feedings provide us with a new management of pylone obstruction I mention this to support the view that the amino acid mixture imposes less of a digestive strain on the gastrointestinal tract than natural food Here are patients in whom even milk would be rejected, but amino acids are allowed to pass

Dr. ALMY The usual diets for ulcer are notor lously low in proteins At a time when we were complaining that the diet of the American prisoner of the Japanese contained only 45 Gm. of protein, I calculated that our standard hourly milk-and-cream feedings provided the ulcer patient with only 35 Gm of protein a day

I wonder what Dr Weintraub has to say about

Dr Co Tui's plan of treatment? We have not yet heard from a radiologist.

DR. SYDNEY WEINTMAUE I was the medleal man proposing surgery for ulcer in the symposium held a few years ago to which Dr Almy referred It was there that Dr Co Tui described his method I have lad no personal experience with it.

Some years ago, I examined the literature and found a remarkable state of affairs. No matter what type of treatment was used whether it was bed rest with the Sippy treatment or ambulatory treatment, or whether it was feeding by tube, the results were about the same. At the end of the first year, there was 80 per cent of cures, if the term cure may be used at the end of the second year it fell to 60 per cent after the third it was 50, after the fourth, 30, and at the fifth year it leveled off at 20 per cent. There was, therefore, a 20 per cent cure in ulcer no matter what method, before the introduction of Dr. Co. Tur's treatment.

The next point I should like to say a few words about is the matter of how to judge a remission or a cure in a case of peptic ulcer First, there are the symptoms, the patient states there is no more pain, he feels fine and he is putting on weight. Then there are the x ray findings, the disappearance of the niche In a great many of these cases which are reported as cured by one or another of these criteria, one finds that they are not cured at all We have had cases in the hospital in which the patient stated he felt well and wanted to go home but the rray showed that the niche had actually grown larger We have operated upon such cases and have found a chronic ulcer stuck to the pancreas. On the other hand, we had 2 cases in whom the niche had practically disappeared, which would make one believe that the patients were cured operation then showed that we had been misled carcinoma had developed in the ulcer

Dr Co Tui has displayed very nice films show ing the reduction in the size of the ulcer should mention that occurs with any kind of treatment We treated large numbers of patients with ulcer at the former Cornell chaic They were mostly ambulant we hospitalized not more than 1 per cent of them. They were all working people and had difficulty in pursuing a rigid diet. In spite of these unfavorable conditions, the niches disappeared in about 95 per cent of them and did so in a very short time. In the average peptic ulcer the niche disappears in about I doubt if it can be accomtwo weeks plished any faster. The rapid subsidence of symptoms and disappearance of the niche after Dr Co Turs treatment seemed to

me much like all of our past experiences with other treatments. I believe that Dr. Co Tui will have something when he can report to us five years later that the curve of recurrences has been materially altered.

Perhaps you will be interested in a story of a single case which we reviewed recently at one of our follow-up conferences I mention it here because in examining the chart, my eye caught the name of Dr Co Tui The patient previously was admitted to this hospital for gastric ulcer, and was discharged improved after eleven days, the treatment to be continued by a private Eight months later, he was readmitted for recurrence of his symptoms history in the interval between these two admissions contained an account of treatments by various doctors, in addition to a course of treatment by Dr Co Tui's method On that regimen, there was diarrhea for three days at the start, the treatment was pursued for fifteen days during which time the patient improved symptomatically and gained eight pounds Then, at the patient's request, three meals a day were added to the regular Co Tui regimen Promptly, the patient began to experience dis-X-ray examination ruled tress with his meals out gallbladder disease and duodenal ulcer patient abandoned this treatment and again consulted various doctors before returning to us for the present admission

There was The x-rays are very interesting the large, broad, base ulcer on the first admission which we reported as a benign ulcer second plate, after the course of treatment by Co Tur's method and others, an ulcer was still The third plate showed marked diminution in the size of the lesion Gastroscopy failed to reveal any lesion Nevertheless, symptoms persisted, and so the patient was operated upon and the area resected Although the lesion appeared to be a benign ulcer on gross examination, the sections showed carcinomatous changes This type of case gives us a good deal of concern, and we are reluctant to temporize with medical treatment because of such experiences I think this person is going to get well, because the resection was made early

I would like to close this discussion by quoting Dr Walter Palmer, of Chicago In a chapter called "The Therapeutic Fallacy," he states as follows "For any chronic disease like peptic ulcer, the course of which is characterized by remissions and exacerbations, the evaluation of therapy is difficult. The cures for ulcer are legion, and most of them will be discarded as their predecessors have been. The annual crop of new cures is due to many factors, one, prevailing methods of treatment are not completely

satisfactory, two, the periodicity of the disease leads to false evaluation of the efficacy of the therapy under consideration, three, the factor of mental suggestion enhanced by the enthusiasm of the physician is extremely important yet difficult to assay, four, and last, the physician and the patient both succumb to the lure of new fads properly advertised "

DR ALM I think we all ought to consider the fact that Dr Co Tur predicted he would have relapses, and was careful to say at least two years ago that the treatment should not be expected to do anything more than produce the first phase of healing

Dr Moore, would you care to comment on the application of these facts to surgical management?

DR SAMUEL W MOORE I think it is perfectly true, as has been brought out in this conference, that in the past we have starved these There has been a tendency to give nothing by mouth, and no protein I share Dr Co Tui's view that these patients should receive protein I also want to reemphasize Dr Weintraub's statement about the periodicity of these Practically all of them can be healed very quickly with medical treatment, but they recur and the patients return to the clinic When we think of peptic ulcers, we should differentiate between ulcers of the duodenum and ulcers of the stomach An ulcer in the duodenum practically never turns into carcinoma, whereas in the case of the stomach, it is a matter of great uncertainty whether it is an ulcer or a carcinoma The doubt often fails to be resolved after repeated gastrointestinal series and gastric an One cannot be certain of it even at operation It is my firm belief, as well as Dr Weintraub's, that, if an ulcer of the stomach fails to heal promptly with medical treatment, an exploratory laparotomy should be performed and if there is anything in the stomach, it should be resected

DR MODELL I should like to ask about the use of Co Tur's diet in bleeding ulcers? Is it continued then, and is the routine the same?

DR Co Tui Yes, it is, and the results are good

DR ALMY I think that the chief objection to feeding in the case of bleeding ulcers is that one might have to operate at any time on such a patient Does not the liquid food overcome that objection to some degree?

DR Co Tui Yes, the stomach is empty within an hour and one-half after a feeding You just omit one feeding and send the patient to the operating room

Dr Weintraub's case is matched by another we had at the French Hospital The patient had

a gastne lesion. We were warned by the x-ray report that it might be a carcinoma. The pa tient felt so well after treatment and gained weight so quickly that both he and his doctor thought he was well He returned in six months with an inoperable carcinoma. It is an important point which I failed to mention in the earlier part of my remarks, namely, the need for differentiating between peptic ulcer of the duodenum and the stomach As to the comparison of the results of our method with those of other methods. I should point out again that we arplied our treatment only to intractable cases cases which failed to respond to other methods Otherwise, our results would have little meaning

VISITOR Is peptic ulcer especially common in countries in which there is nitrogen starvation?

Dr. Co Tui There seems to have been an increase in China. Peptic ulcer was a farly infrequent occurrence among the Clinese During the war mainutrition air raids, and other war wornes played a part in the increase I don't know which one of those factors has brought it about. I am not trying to blame protein deficiency for the production of peptic ulcers, but it is quite possible that protein deficiency prolongs peptic ulcers and prevents them from healing.

DR. KIRST MARTIN Could we ask Dr Co Tui how he selects his cases for this type of treatment?

Dr. Co Tui Our original series were intractable cases. We went to the medical wards where we had patients in bed on a course of Sippy treatment.

When they falled to respond to it after three weeks we took them over Our ambulatory cases usually had a history of from three weeks to three months of ambulatory treatment outside which had failed to control their symptoms, it was then that we took them over

DR. WEINTRAUB What are your results with the marginal ulcers?

Dr. Co To: At first we thought they were very good I don't think they are good at all now

Dr Weintraub mentioned the matter of suggestion in the treatment of peptic ulcer I think it has to be considered but we must not give it too much weight.

The fact that a patient may take one hydrolysate with improvement and another without any, to some extent helps to rule out suggestion as a cause of the response.

DR GOLD I wonder whether Dr Co Tui has had any experience with the yeast hydrolysates There is a material made by Marvin R. Thompson which seems to me to be quite palatable. Dir. Co Tui That reminds me of the subject of preparations The market will be flooded with these products some good and some bad A hydrolyante which is not well prepared can cause more harm than the natural food I would suggest that we confine our work to only those products which have been shown to be efficacious. There is a hydrolysate made from yeast, which is now provided by various companies among them Marvin R. Thompson I have tested it in two cases. One responded well and one did not It is too early to say much about it

There are three products which we are now testing all acceptable and all having good points. These are the casein hydrolysate of E. R. Squibb and Sons the protolysate of Mead Johnson and Company and the lactalbumin distributed by the National Drug Company With these three we have been able to keep our patients fairly happy. In most cases when one is rejected another may be taken without difficulty. I don't know why that is

Dr. McKeen Cattell Are there any side reactions?

Dr. Co Tui Yes there are side reactions The worst one is nausea. Some patients just can't take it. We try to get around that by making the sugar in one solution and the hydrolysate in another The hydrolysate is made up in as small a quantity as possible and chilled They gulp it down and follow it with the dex trimaltose. With that kind of treatment we have been able to reduce the number of reac-Other symptoms may be flatulence distention and diarrhea. Diarrhea is a very prominent one that we control by changing the product. For diarrhea we formerly used amphoiel in one or two tablespoonful doses now we use kaolin or kaopectin in tablespoonful doses That usually controls distribea Flatulence may be controlled by shifting from the dextrimaltose to lactose, and where it cannot be controlled that way we give charcoal with it We have lately observed such reactions as palpitation. flushing and dusziness. They may not be caused by every batch of the product it may be due to histamine or a histaminoid substance

#### Summary

Dr. Gold The discussion this afternoon centered chiefly on the value of a new method for the treatment of peptic ulcer based on the viewpoint that a defect in protein metabolism may be a major factor in promoting peptic ulcer and preventing its healing. The essentials of the method consist in the administration of a high calonic diet representing for the average

adult about 350 Gm of predigested protein in the form of a protein hydrolysate together with approximately 500 Gm of sugar, providing a total of about 3,500 calones daily The utility of this method was discovered accidentally in the course of the preoperative preparation of patients with intractable ulcer The rapid disappearance of symptoms and apparent healing of the ulcer as shown by x-ray led to a more extensive trial Several other advantages of the method have been pointed out, namely, the fact that this diet seems to relax pyloric spasm and is. therefore, applicable to cases with what appears to be complete obstruction, and that it may be used in patients with bleeding ulcer, since the fluid diet, leaving the intestinal tract very quickly, does not interfere with operation should it become necessary The details of the protein hydrolysate-sugar feedings were outlined

The choice of protein hydrolysate preparations seems to be a matter of considerable importance, some being not only more palatable than others, but also more effective from the therapeutic standpoint

The precise manner by which this diet brings about these results has not been established Several theories have been advanced. There is the possibility that it acts in part as an antacid, although there is indication that it may possess other actions as well, both local and systemic. The method is not free of disagreeable reactions,

partly due to the unpleasant taste and local actions of the protein hydrolysates, and partly the result of systemic side-actions

As might have been expected, claims for a new method for the treatment of peptic ulcer would not go unchallenged, and so it has been pointed out that the superiority of this method is fai from proved, that most of the older methods relieve pain just as quickly, and promote the healing of the niche, as shown by x-ray, in much the That hyperalimentation with prosame way tem hydrolysates does not prevent recurrences has already been observed, but whether it will reduce the frequency and numbers of recurrences remains to be seen, and the issue concerning the superiority of this method revolves around Special emphasis was placed on the fact that the striking results with this new method were obtained in patients who had failed to respond to the older methods of treatment

The discussion brought out several additional points of interest, which one cannot afford to forget, namely, the fact that symptoms of ulcer may subside while the ulcer niche continues to enlarge, and, conversely, that the size of the niche may diminish, which suggests healing while the symptoms persist. The desirability of surgical exploration in the latter cases was emphasized, especially in cases with gastric ulcer, since in these there is always the danger of carcinomatous degeneration.

#### ANNOUNCEMENT OF NEW OFFICERS

The American Laryngological, Rhinological and Otological Society, Inc., announces the following officers for the year 1947 to 1948 Dr. Lyman G. Richards, Brookline, Massachusetts, president, Dr. John J. Shea, Memphis, Tennessee, president-elect, Dr. Kenneth M. Day, Pittsburgh, Pennsylvania, treasurer, Dr. Theodore E. Walsh, St. Louis, Missouri, editor, Dr. Raymond H. Marcotte, Nashua, New Hampshire, fellowship committee, Dr. C. Stewart Nash, Rochester, New York, secretary. The following will be vice-presidents. Eastern Section, Dr. J. Winston Fowlkes New York City, Southern Section, Dr. William A. Wagner, New Orleans, Louisiana, Middle Section, Dr. Hugh G. Beatty, Columbus, Ohio, and the Western Section, Dr. Meade Mohun, San Mateo, California.

The members of the Council are Class A, Dr James G Dwyer, New York City, Dr H Marshall Taylor, Jacksonville, Florida, and Dr Walter H Theobald, Chicago, Illinois Class B, Dr Albert C Furstenberg, Ann Arbor, Michigan, Dr Rea E Ashley, San Francisco, California, and Dr LeRoy A Schall, Boston, Massachusetts Class C, Dr Harry W Lyman, St Louis, Missouri, Dr Francis E LeJeune, New Orleans, Louisiana, and Dr Henry B Orton, Newark, New Jersey

The coming Section Meetings will be held as follows Eastern Section, January 16, 1948, New York City, Middle Section, January 19, 1948, Columbus, Ohio, Southern Section, January 23, 1948, New Orleans, Louisiana, and the Western Section, January 31 to February 1, San Francisco

uary 31 to February 1, San Francisco
The midwinter Council Meeting will be held in
New York City on January 17, 1948

Arrangements have been made to hold the Annual Meeting at Chalfonte-Haddon Hall in Atlantic City on April 7, 8, and 9, 1948

City on April 7, 8, and 9, 1948

The American Otological Society and the American Laryngological Association are planning to hold their meetings at Old Homestead, Virginia, the former on April 12 and 13, 1948, the latter on April 14 and 15, 1948

#### Morning Session Tuesday, May 6, 1947

Section 69 (See 45)

Report of the Reference Committee on Report of Council—Part X. Qualifying and Rating Physicians Under the Workmen's Compensation Law

DR. F. W. HOLCOMB. Ulster. The next is a resolution introduced by Dr. William J. Orr on qualifying and rating physicians under the Workmen s. Compensation Law, and which reads.

"WHEREAS the proper rating and authorization of physicians is vitally essential to the effective accomplishment of the purposes of the Workmen s Compensation Law particularly the provision of

the highest quality care for injured workers, and "WHENEAS, the County Medical Societies of this State have performed a notable job in assisting the Chairman of the Workmen a Compensation Board to properly rate and authorize physiclans to render medical care to persons entitled to the benefits of the Workmen's Compensation

Law, and
Wheneas, the 1947 State Legislature enacted
the Condon bill which empowers the Chairman of the Workmen's Compensation Board to review and revise physicians' compensation ratings and

WHEREAS the Medical Society of the State of New York believes that the County Medical Societies, because of their specialized knowledge, familiarity with local conditions and with the actual qualifications of physicians are best equipped to determine the character of medical care physicians are qualified to render, therefore be it

Resolved, that the Medical Society of the State of New York at this duly convened session of its House of Delegates, recommend to the Chairman of the Workmen a Compensation Board that revi-sions of ratings be made by the County Medical Societies and the Chairman of the Workmen's Compensation Board in accordance with the

qualifying standards heretofore formulated by the County Medical Societies and be it further Resolved that a copy of this resolution be transmitted by the Secretary of the Medical Society of the State of New York to the Chairman of the Workmen s Compensation Board.

Under the Act (Condon, 1708) this law provides that a change of rating shall be made only on recom-mendation of the Medical Society or of the Medical Practice Committee On such advisory recommen-dation, the Chairman of the Workmen's Compensation Board may review or after reasonable investigation may revise, the rating of said physician according to the character of medical care which he is actually qualified to render

If a physician is dissatisfied he may apply to the Medical Appeal Unit of the Department of Labor We feel that a physician should be entitled to a

hearing before a change in his rating is made. Qualifications for recommending ratings are adopted by the County Medical Societies them-

colvea. Your Reference Committee feels that under the

revised law no hearing is afforded before change of rating is made either by the Medical Society or the Medical Practice Committee Such hearing should be afforded by either or both before any change is made.

This resolution does not properly reflect the law a. amended We approve this however in principle in the matter of authorization or recommending rating through the action of the County Societies. I move the approval of the action of the Reference

Committee in this matter

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

Section 70 (See 89)

Report of Reference Committee on Report of Coun Activities of the Medical Practice cli—Part X Committee

DR. F. W. HOLCOMB Ulater The next is a resolution introduced by Dr. J. F. Painton, of Eric

County concerning the activities of the Medical Practice Committee and reading
"Wiffenbas, the Medical Practice Committee of Greater New York functioning as a statewide agency of the Workmen & Compensation Law research ceives applications for, and recommends rating and rerating of physicians outside Greater New

York, and
WHEREAS, the Medical Practice Committee of
Creater New York has established standards for qualifying physicians throughout the state, and

WHEREAS, the Medical Practice Committee of Greater New York receives applications for and recommends the licensing of Workmen a Compensation Medical Bureaus outside Greater New

JOHN AND THE ASSESSMENT OF THE MEDICAL PROCESS OF THE MEDICAL PROCES be it

Resolved, that the counsel of the Medical Society of the State of New York proceed legally to reetrain the Modical Practice Committee activities as a statewide agency of the Workmen a Compensation Law

This resolution undoubtedly ments consideration as a complaint against an alleged existing practice of However, it does not offer a qualifying physicians constructive alternative procedure, such as the abolition of the Medical Practice Committee, and to restrain the present Committee's activities would result in confusion
